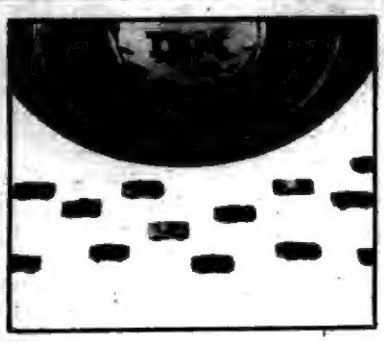
FORECAST '84 CONTENTS



4 Annual DP Budget Survey
A survey of DP managers finds that 1984 budgets are on the rise — but more conservatively than in past years.

8 Management by Consensus
As automation spreads throughout the offices of large corporations, MIS directors are finding that carte blanche decision making is a thing of the past.

12 MIS Managers
Knowing how to program a computer and run a DP operation is no longer the whole formula for success in a business-oriented high-tech world, five MIS executives say.

16 What's Hot! What's Not!
In a field where trends change as quickly as the weather, the technologies that were on top yesterday are not necessarily there today.

19 Micros and the End User
The honeymoon is over. Now that big business and small computers are wedded, can the marriage survive?

23 Micro-Mainframe Links
More than a few vendors have announced micro-to-mainframe connections, but it may be wise to look carefully before leaping to any vendor offering early solutions.

30 IBM
Through marketing savvy and organizational quick-footedness, Big Blue has made big strides in sweeping all its competition by the roadside.

36 An IBM Look at the History of Computers.
A recent exhibit shows how IBM scientists and engineers have not only pushed the firm to the top, but helped shape the destiny of computing.

40 DEC
The past year has been one of ups and — for the first time — dramatic downs for Digital Equipment Corp. But the roller coaster ride may be over as DEC prepares to go back to the basics in 1984.

44 The AT&T Divestiture
The Bell system will be officially broken up on Jan. 1, but telecommunications users still do not have the answers to some important questions about what it will cost them.

49 White-Collar Crime
While DP criminals working from the outside have been the center of much attention in the past year, a greater problem may be those culprits working from the inside.

57 Computer Crime
The U.S. may have more computers, but it doesn't have a monopoly on computer crime, according to a survey of seven countries.

61 Fifth-Generation Computing
The worldwide race to develop a new generation of computers is now an all-out battle. The stakes may be political as well as industrial supremacy.

68 Relational Data Base Management Systems
Relational DBMS are becoming more sophisticated and offer more information control, but at a price.

71 Information Centers
Two years ago the information center was just a concept with a promise. Today it is an integral part of a number of large corporations.

77 Unix and the New Contenders
It won the hearts of academia, but it's had a tough time convincing business users it has a future. Could Unix yet become an operating system standard?

85 Privacy Issues in 1984
Although computers were not a part of George Orwell's *1984*, they are the center of concern for those who fear for the privacy of individuals.

88 Computer Matching
Government agencies are swapping data, and computer matching is in full swing. But limiting its use and its impact on privacy are issues that are far from resolved.

96 Industrial Policies in an Election Year
The Democrats will claim that the current administration has been disastrous. The Republicans will claim that the economy and workers are getting back on their feet. Who is to be believed in Election Year 1984?

99 Computers in Elections
The days of one-on-one electoral campaigns are over. Today, a candidate's chances of success are based on his data processing as well as his political strengths.

101 Third-Generation PBXs
Although PBXs that can juggle both voice and data communications are only three years old, they already have a steady following.

TURBO

Why are SYBACK & SyncSort CMS the fastest things on no wheels?

(More technology in the tank!)

Call (201) 568-9700.

Arrange a test drive.

You say you've always had very simple tastes? All you ever wanted was the best?

Well, step into our showroom and kick a few tires! We'll show you two programs that are the Ferrari and Lamborghini of VM programs.

- **SYBACK – the world's fastest and most maneuverable backup, restore and copying program;**
- **Syncsort CMS – the world's fastest and most maneuverable VM/CMS sort program.**

What makes 'em so special? Well . . .

(1) TURBO PERFORMANCE: Have you ever stepped down on the gas in a dangerous driving situation and discovered . . . nothing? Well, that'll never happen to you with these two vehicles.

Both are equipped with our special brand of "software turbocharging." We call it FBT, which stands for Fluid Buffering Technique. Our competitors call it something else.

We discovered FBT one dark and rainy night when we were trying to find a way to speed up the movement of data in sort programs. After crying "Eureka," we applied it to our OS and DOS sort programs. The results were . . . wow!

Now we've carried that bright idea over into VM dump-restores and sort programs. And the results are still wow! Compared to any other backup or sort program clogging the nation's VM thruways today, SYBACK and SyncSort CMS will save you up to:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

So who needs all that speed? You do. If you want to optimize your VM operations, stay out of needless DP traffic jams, and make the boss happy with your throughput.

Here's what happened to one large government agency. Their backup operations used to require a full 24 hours to complete. Then they installed SYBACK. Now their backup takes — are you ready? — one-half hour!

(2) EASY HANDLING: SYBACK and SyncSort CMS are among the most flexible, user-friendly programs ever produced by anybody anywhere. That's one reason programmers love 'em. And where does it say that backup and sort operations have to be hard to be good?

(3) "MISTER SOFTWRENCH" SERVICE: We've got the best pit crew in the business. More than 85% of all customer requests are resolved within 24 hours.

If you'd like to put a little high technology in your VM tank, give us a call. We might even take your used VM dump-restore or sort program as a trade-in!

Annual DP Budget Survey

PHOTO © 1983, GEORGE BILLIS

Picking Up the Check

By Peter Bartolik

It may be the fear of future inflation, or perhaps the tail end of the recession. But whatever the reason, DP budgets are increasing at a slower rate than over the past two years, even as DP centers take on increasing responsibilities, *Computerworld's* annual survey of DP managers has found.

While several of the 49 DP managers polled this year said they are appropriating money in anticipation of AT&T divestiture-related increases, for microcomputer purchases and for end-user training, budgets as a whole are not growing as fast as they did last year and the previous year.

The majority of respondents to the survey — 67% — said their budgets for 1984 will be up over the 1983 level, while 15 will experience level funding and one will work with a smaller budget. The increases will average 12.4%, compared to the 17% reported last year and the 20.3% reported the year prior to that.

The one manager who reported a reduction — a whopping 33% cut — said it is the result of a corporate reorganization.

The economic recovery being touted in Washington, D.C., has yet to show up in the spending plans of an overwhelming majority (83.6%) of the managers. A few even said they are still feeling the affects of the recession.

The fastest changing areas of the data processing world, microcomputers and communications, are creating wide divisions in the manner of dealing with procurement and administration, according to this year's survey. Twenty of the respondents reported that microcomputers are purchased out of DP budgets, while 20 others reported micros are purchased by end-user budgets (the remainder had no set

---

Staff Writer Peter Bartolik coordinated the efforts of the Computerworld writers who conducted the survey upon which this story is based. Members of the survey team included staff writers John Gallant, Lynn Haber and Patricia Keefe and West Coast correspondent Robert Batt.

DP BUDGET SURVEY

policy); last year, 19 managers said end users paid for micros and only six said DP departments paid.

Perhaps reflecting the experimental aura surrounding micro implementation, Henry Goldbeck, DP manager of Follet Corp. in Chicago, said his company established a "micro study budget" and will purchase about 100 units this year from that budget.

End-user training, particularly with regard to micros, is a responsibility for 55% of the managers, but only half have a readily identifiable budget line item to fund that responsibility. "It's part of each programmer's job," Goldbeck noted, "but it is not budgeted."

Communications

Communications appears to be another area where both DP management and upper management are feeling their way. Almost half, 45%, reported they have some responsibility for corporate voice communications policy, ranging from giving advice to selecting the entire telecommunications system. An identical percentage also said they have set funds aside in anticipation of increases resulting from the divestiture of AT&T, but only four managers without some say over voice communication have made such a provision.

At Helene Curtis Industries, Inc. in Chicago, according to DP Director Edward Valliere, "We're very concerned [about the AT&T divestiture]. We're just waiting to see; we put aside $20,000." But James Durkee, vice-president of management information systems for Carson Pirie Scott & Co., also in Chicago, represents the other end of the scale: "We've been upgrading our own switches with purchased equipment. We're positioned to buy anyone's service."

According to the survey, communications will eat up an average of 10.8% of DP budgets in 1984, about the same as last year.

As in previous years, salaries continue to eat up the lion's share of the budget, but that share has dropped slightly from 46% to 43%.

The actual salary increase are lower than in previous years, averaging 5.7% across the board and only 5.8% in those departments which actually are increasing spending for salaries in 1984.

Last year, departments that increased personnel salaries experienced an average 17% increase over the previous year.

In a seemingly inconsistent reversal of last year's survey, 57% of the managers surveyed plan to hire additional personnel this year; last year, 58% planned not to hire. Positions being created are generally for programmers, analysts and support personnel, although one department expects to hire a data base management system administrator.

Members of this year's survey group said they have less trouble finding qualified DP personnel than last year's group; only 55% of the 1984 group said they have problems filling positions, compared to 62% last year.

Personnel turnover rates in 1983 were greater than last year's at 20% of the departments, smaller at 36.5% and the same at half of the departments covered in the survey; the 1982 survey had found sharply decreased turnover, which may indicate that DP personnel this year are more secure in their ability to find new employment in an eco-

FREE 82-PAGE BOOK EXPLAINS TRANSACTION PROCESSING.

A new 82-page book, "SYNAPSE TRANSACTION PROCESSING. SYSTEM OVERVIEW.", clearly illustrates how a systems designer can accelerate development of a high-performance, fault-tolerant, on line transaction-processing system.

It discusses automation of integrity and recovery. Tells how to get performance from a Relational DBMS. Describes transparent expansion of a system on line. And it has a complete index.

The book presents a comprehensive, management-level introduction for the nontechnical manager. Yet it provides an adequate overview for the technical manager and staff.

To obtain a free copy, call (408) 946-3191. Or write: Synapse Computer Corporation, Corporate Communications Department CW, 801 Buckeye Court, Milpitas, CA 95035.

2 Trillion

Last night we backed up two trillion (yes, that's 12 zeroes) characters of data, and checked our work.

VMBACKUP

We bring files back alive, the way they should be—readable, usable—which some "cut-rate" backup systems *don't* do. We verify the data before moving it to tape. That's why 75% of the Fortune 100 companies trust their vital data to VMBACKUP.

How do we do this?

- Start with a solid design.
- Take the best systems people in the VM community.
- Have them build it right.
- Add competent, helpful support people.
- Stay close to our customers.

And we create a winning situation for our users.

VM Software Inc.

(703) 821-6886

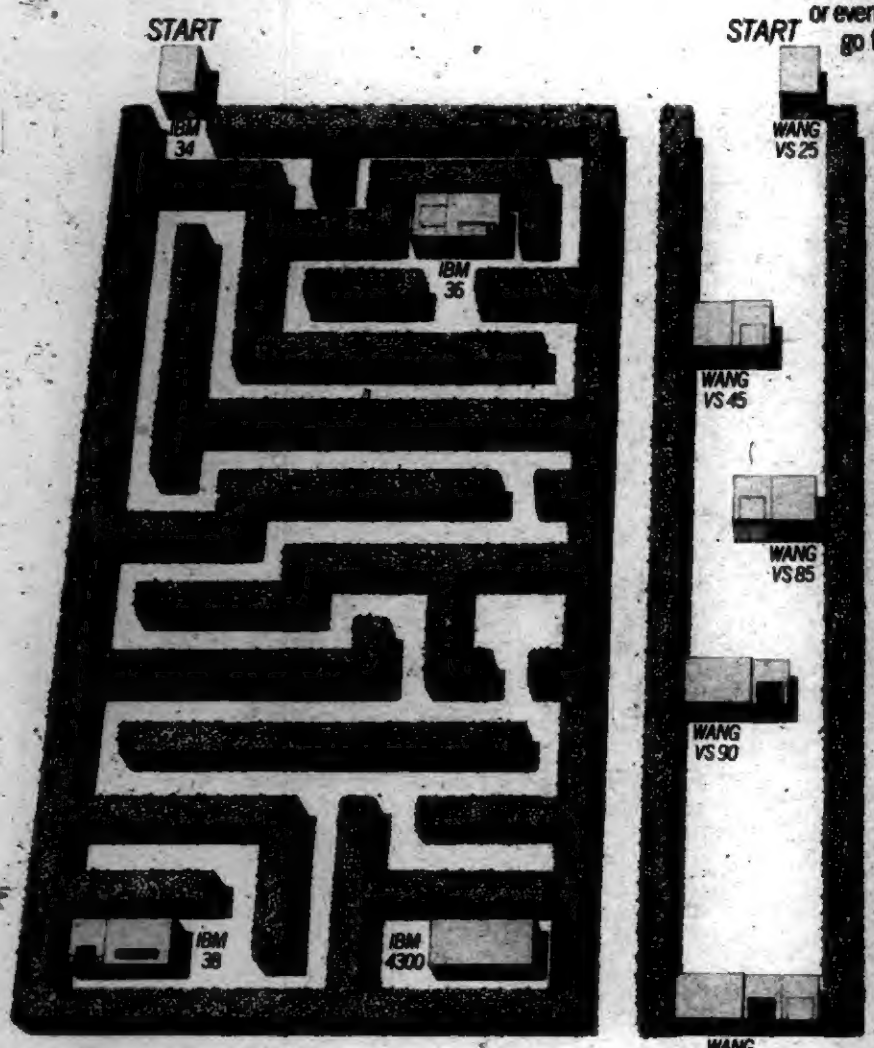
Compared to IBM, Wang has the growth path of least resistance.



If you're currently considering an IBM 34 or even a 36, consider this: where do you go from there?

To an IBM 38? Sure, if you want to spend up to 18 months converting to a different operating system, different source codes, and different software.

To an IBM 4300? The same problem again. Only magnified. Because if the IBM 34 and 36 have little in common with the IBM 38, the IBM 38 has nothing in common with the IBM 4300 (logo excepted).

Now consider the Wang VS line.

One operating system that supports the same software, utilities, and documentation. A line that's compatible from top to bottom and bottom to top. A line that's compatible with other Wang equipment as well as most mainframes, including IBM. And a line that can tie you into total office automation faster and easier than any other systems available anywhere.

But even if you only need a single computer, a Wang VS is a better choice. Because every VS offers data processing, voice, graphics, electronic mail and extensive networking. And only a Wang VS offers Word Processing Plus, feature for feature the most comprehensive word processing software in the world.

So whether you plan to buy just one business computer or a whole lot, the Wang VS line is simply the best way to go. And the only way to grow.

Compare it to IBM; it's easy to see why Wang offers the growth path of least resistance.

For a demonstration of Wang VS computers, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

DP BUDGET SURVEY

(Continued from Page 5)

nomic upturn.

Most managers, about 60%, won't hire personnel without formal DP training. But the majority of those who do hire novices find them to be effective personnel. "Given a little bit of time to learn, they become very effective," said David Sheppard, senior vice-president of DP services with the Boston Co., a financial services company in Massachusetts.

More than 65% of the managers have appropriated funds for training, and such funds average 2.53% of the total budget among the 26 managers who were able to pinpoint the figures.

In a slight dip from last year's 50:50 ratio, the managers reported their programmers spend an average of 45.3% on maintenance work and the rest on new development.

Programmers spend more than 50% of their time on maintenance at 20 of the 49 shops that were surveyed. Three managers reported they employ separate teams of programmers for maintenance and development; one of those said the programmers rotate between maintenance and development.

Vendors will be pleased with one aspect of the survey: 80% of the managers plan to purchase new software, and slightly more than 70% expect to buy additional hardware and peripherals.

Ten managers reported they will be purchasing various types of financial applications packages such as accounts receivable, general ledger and the like; seven will purchase data base management systems; five will be purchasing packages to run under IBM's MVS operating system; three will purchase fourth-generation software; and three will purchase applications generators. Only two managers expect to purchase micro-to-mainframe linkage packages.

IBM will be the big winner in the hardware area, with 10 IBM 3081s (nine at one shop alone), three 3083s, two 4300 series machines, three System/36s and one Series/1 on the managers' shopping lists. One shop plans to buy seven of Tandem Computers, Inc.'s Non-Stop II or TXP units; and several plan purchases of minicomputers and micros.

Purchase and lease of hardware, along with service and maintenance, will cost DP shops an average 19.7% of their budgets this year, down from last year's 22%. Mainframe costs will eat up the largest chunk, with 15 shops reporting the purchase and license fees at between 30% and 40% of their total budgets.

Software Costs Rising

Software costs, however, will chew up a far greater chunk of the 1984 budget than they did in 1983. Reflecting perhaps the large number of managers purchasing new packages this year, software costs will average about 19.6% of the total budget, compared with only 10% in 1983.

Overall, half of the managers said their greatest cost increase this year will be in the area of salaries; 28.5% said hardware and 22.5% indicated software will go up the most (some managers picked more than one area, accounting for the figures adding up to more than 100%).

'Seven managers said their greatest concern [in 1984] will be to reduce backlog, and another five said their concern is to improve efforts to make information available to the end user.'

Three managers said their greatest increase will be in the purchase of outside consulting services. Asked to list their concerns as department heads for this year, the managers listed a wide variety.

Seven managers said their greatest concern will be to reduce backlog, and another five said their concern is to improve efforts to make information available to the end user.

Six managers said they are most concerned with supporting corporate goals, and five said increasing productivity tops their list. Five managers mentioned personnel; four are concerned with micro proliferation and micro-to-mainframe communications.

Management By Consensus

The MIS Chief 's Balancing Act

By David Myers

The spread of microcomputers and word processors through the offices of Fortune 1,000 corporations has forced the management information systems (MIS) chief to walk a tightrope.

Beneath lies annihilation — the loss of power within the corporation, even the loss of a job. On the other side lie enhanced stature and leverage, a more important role within the corporation. Whether he makes it across is almost entirely up to him.

Office automation has sparked a trend within America's largest corporations toward computer decision making by consensus or committee. There is nothing radical in that. Corporations live and breathe by committee.

But in the past, it was always the MIS chief who decided how the corporation was going to automate its information processing functions. Suddenly the MIS director finds he can no longer act alone.

"When it comes to general planning, equipment selection, vendor selection and implementation strategies, it is no longer clear that the MIS director has carte blanche," according to Tom Willmott of International Data Corp., a Framingham, Mass.-based market research firm.

"MIS decisions were once restricted entirely to the data processing department. Administration department heads would choose things like PBX [private branch exchanges].

"Now the MIS director may be involved in office automation, but the president of the company has his finger in the pie, too. No longer is it 'MIS director, write a check,' " Willmott maintained.

Why has office automation sparked this trend? Probably because it got its start outside the data processing department, in the administrative offices of the corporation.

As Susan Roper, manager of office automation for Hughes Aircraft, put it, "More and more individuals are saying they want that tool." They aren't walking down the hall to the DP department for help, that is; they are demanding the resources for solving their own problems themselves.

What has resulted is a proliferation of microcomputers throughout many corporations. Rather than waiting for the MIS chief to get around to them, department heads are going out and buying machines for their personnel.

(Continued on Page 10)

David Myers is Computerworld's correspondent in New York.

Their way.

Our way.

IDMS/R Automatic System Facility.

One database management system provides an Automatic System Facility for system development: IDMS/R.

Fourth generation languages, though excellent productivity tools, only address part of the system development task – namely, steps three and four as shown above. IDMS/R with Automatic System Facility, however, automates all of the steps necessary to develop systems. All you do is specify the data.

The Automatic System Facility dynamically builds the system.

It defines the database; creates screen formats; develops the applications; links the definition, screen and application together, then documents the system.

One DBMS using a powerful system development facility does it all. And does it all automatically. IDMS/R.

For more information on this facility, to attend a seminar or for a demonstration call (617) 329-7700.

MANAGEMENT BY CONSENSUS

(Continued from Page 5)

Joseph E. Izzo of the JIA Management Group pointed out that in 1979 only 5% of the computers installed in U.S. companies were outside the control of the data processing department. This year the number is gauged at between 30% and 35%.

"When the [Apple Computer, Inc.] Apples came out, everybody wanted one. They became a sort of de facto standard. Now the same thing is happening with the IBM [Personal Computer]. We have to race just to keep up," said Jim Stockwell, manager of data processing at Teledyne, Inc.

> *"'The MIS group is not a police force. I don't see it as our role to go out and see if [other departments] need the productivity gains they say they'll be able to achieve" with office automation.'* — Raymond Priore, vice-president of systems and information processing at Consolidated Edison of New York.

Of course, as soon as one brand of computer is installed in one department and another brand in another department, the problem of incompatibility rears its ugly head.

In order to stave off incompatibility woes before they arise, many firms are beginning to appoint committees to draw up plans for corporationwide office automation.

The committees are not a welcome sight; no one in American business wants to serve on yet another committee; but they became necessary when it grew clear that DP departments did not have the power to enforce compatibility requirements.

"We have no centralized control. These people [in other departments] don't necessarily have to come to us" before springing for microcomputers, Roper said.

Indeed, a good many American firms are "highly decentralized," split up into "individual business units with their own business requirements," as Anthony Pizzelanti, vice-president for information systems at the Macmillan Publishing Co., pointed out.

Central Committee

In these firms, a central committee — often disguised under the genteel sobriquet "Office Automation Task Force" — is the only way to keep track of and have a semblance of control over what is happening in the various corporate departments.

The committee may include top-level executives. "I expect senior management to get more attuned to the process. It's inevitable anyway," Pizzelanti said.

The involvement of top-level execs is inevitable because office automation is something that interests them, whereas data processing seems alien, according to Teledyne's Stockwell.

What is more, top-level executive involvement is welcome to many MIS directors because it relieves them of the responsibility of judging other department heads' equipment requests.

'Not Police Force'

"The MIS group is not a police force. I don't see it as our role to go out and see if [other departments] need the productivity gains they say they'll be able to achieve" with office automation, noted Raymond Priore, vice-president of systems and information processing at Consolidated Edison of New York.

An Office Automation Task Force also prevents other departments from feeling as if strange machines, foreign procedures and unobtainable productivity goals have been foisted upon them.

"It's a way of ensuring that the right constituency gets involved in decision making," according to Raymond L. Boggs of the Venture Development Corp.

You Probably Thought We Were Selling Computer-Controlled Computer Power.

Powercenter Plus™
Power Distribution System

Actually...We're Selling Peace of Mind.

Some jobs are difficult. Others are just plain impossible – like estimating all the costs of computer errors due to line voltage sags and surges, to say nothing of brownouts. But now for a small percentage of your facility investment, you can have complete protection against troublesome voltage variations. And you can have immunity from noise and the effects of load changes, frequency changes and power-factor changes, too. Not to mention flexible distribution of power throughout the computer room, monitoring of all key power parameters, and two-level facility protection. Powercenter Plus™ power distribution system – it's the only power center that does it all. Complete with microcomputer-controlled power conditioning, of course.

That's peace of mind.
That's our business.

MANAGEMENT BY CONSENSUS

Thus the task force is a sort of users group. And some firms, in fact, have set up a variety of small, in-house users groups rather than a single central committee and have decided to permit a controlled proliferation of small systems, as long as there is no overlap between departments with incompatible machinery.

In any case, the task force or users group method of decision making puts the burden of proof squarely upon the user for justifying his need for automated office equipment.

"It's the user's requirement, so he should be the one to have to justify it to the corporation. Not that I couldn't participate in the justification process. But I don't see that as my role," Priore contended.

Added Benefit

Placing the onus for justification upon the user has the additional benefit — from the MIS director's perspective — of awakening department managers to the cost and implementation difficulties that are involved in a new system.

As Roper pointed out, involving users in the acquisition process scales down their expectations and makes them more sensitive to everything that goes into choosing and starting up a system.

"If they are not involved in the acquisition process, they could end up wasting more time with a personal computer than they save," Roper said.

MIS Chief's Role

But what of the MIS chief's role in all these changes? Will the increased involvement of top-level execs in computers decrease his power within the corporation? Or will the involvement of users in computer acquisition increase their dependence on him and so enhance his standing in the firm?

"It all depends on the character of the MIS manager," Boggs said. "If he is really concerned with how the equipment is going to be used on a day-to-day basis, which means he must understand how business is conducted so the equipment won't have a disruptive effect, then he has a future.

"But if he is technologically driven — if he is insensitive to people's needs — he is vulnerable to being co-opted by the committee," Boggs added.

To survive the challenge of office automation, the MIS chief must become "far more of a businessman than he is now," JIA's Izzo agreed.

Izzo suggested that the MIS director should subscribe to *The Wall Street Journal* and *Business Week* and concern himself with the most pressing of business issues.

'Not Just Manager'

The encroachment of top-level management upon his traditional territory means the MIS chief must become "a leader, not just a manager," Izzo added.

While some MIS directors bemoan a weakening of their position as a result of growing "computer literacy" in the executive suites, others are viewing it as an opportunity to be seized.

As Roper pointed out, the MIS managers are the ones to provide training and guidance. As Teledyne's Stockwell explained, as long as there is a need for technical advice, there will always be a need for MIS directors. Those who fear a reduction of their power as executives learn more about computers have already had their power reduced, Izzo said.

"The more executives know, the more powerful he [the MIS chief] should be. That's where his greatest power will come about. As executives become [computer] literate, he has the chance to become a leader," Izzo said.

Perhaps the greatest challenge, however, will be not to the MIS director himself but to the data processing department as it is known today.

As more and more users become adept with office automation, they may begin to infiltrate the inner computer sanctums. And there may evolve a new organization within the American corporation — the Office of Computer Technology.

> ***Will the increased involvement of top-level execs in computers decrease his power within the corporation? Or will the involvement of users in computer acquisition increase their dependence on him and so enhance his standing in the firm? "It all depends on the character of the MIS manager. If he is really concerned with how the equipment is going to be used on a day-to-day basis, then he has a future. But if he is technologically driven, he is vulnerable to being co-opted."***

Computerworld has news for you.

Microcomputer News.

Beginning with your January 9th issue of *Computerworld*, you'll get a new special section in every issue. A section completely devoted to microcomputers in the corporate environment. And if that's your environment — to work in; to consult to; to supply — then you're going to look forward to this section every week.

You'll get the products . . .

You'll get useful information on all single- and multi-user microcomputer systems with commercial applications — and micro peripherals, boards and add-ons — from the angle of the corporate user. And you'll get news on those business micro software packages designed for corporate micro users in large organizations. And that's just the product coverage.

. . . and the pundits.

You also can look forward to hearing regularly from guest columnists and industry experts on the trends, the technology, and the strategies you need to keep up with the microcomputer marketplace.

MIS Managers

Traditionally one of the most underbudgeted items in data processing, DP training needs have grown beyond the traditional technical courses offered to help departmental staff keep up with the latest hardware and software innovations. Today, because of the growing corporate reliance on the management information systems (MIS) function and the onslaught of end-user computing, a new dimension to training has been created — one that imbues everyone in the DP department, from the vice-president of information systems to the programmer, with a business orientation.

An understanding of business in general — and the specific company's business in particular — bodes well for DP professionals who can expect to broaden or lengthen their career paths by taking steps to become business-literate while working to help their end users become computer-literate.

In an attempt to determine the role of MIS in relation to the needs of the corporate world, Computerworld *recently interviewed five high-level MIS executives employed in industries that represent some of the largest users of information processing. The professionals interviewed included:*

- *From the retailing industry, Anthony M. Grybowski, manager, Systems & Data Processing, Federated Department Stores, Ohio. Grybowski holds a B.S. in accounting and an executive degree in business data processing.*
- *From the manufacturing and services sector, Donald J. Marino, director of Management Information Systems at Bendix Corp. in New York. Marino, who earned a B.S. in business administration, worked 10 to 12 years in product scheduling before spending the last 20 years in systems analysis and systems management.*
- *From the transportation industry, Robert Forstrom, vice-president of Information Systems for The Bekins Co. in California. He has a B.A. and a master's degree in chemical engineering. Forstrom began his DP career as a systems programming manager 20 years ago.*
- *From the diversified financial area, Edward Huntington, assistant vice-president/Equipment, Finance Data Center, Citicorp Industrial Credit in New York. Huntington, who concentrated in computer science in college, has been in DP for 22 years.*
- *From the commercial banking sector, H. Alfred Colby, senior vice-president of Information Services, John Hancock Mutual Life Insurance Co., Boston. He has a B.S. in economics and worked on systems analysis and managed projects in the user community before being promoted to his current position.*

Broadening the Perspective

By Patricia Keefe

Is it important for management information systems managers to broaden their perspectives and skills beyond the narrow technical realm of DP? If so, why?

Grybowski: Absolutely. The MIS director has to respond to the business that the organization is in and the DP business. In order to do so, he must be involved in all aspects of the company, such as marketing and manufacturing, to get a feel for the business and to implement priorities with upper level management.

MIS executives need to be more aware of corporate goals so they can contribute a bit better to the bottom line. In other words, MIS directors should not operate in a vacuum.

Marino: There's no question that much of the black eye given MIS in the press — some of it well deserved — is created by the fact that [MIS has] taken technicians and made them managers instead of taking managers and teaching them technical abilities. All of my managers are business-oriented. At Bendix [Corp.], now Allied [Corp.], we have a kind of top-down, bottom-up structure where our strategies and

Patricia Keefe is a staff writer at Computerworld.

Anthony M. Grybowski

H. Alfred Colby

Donald J. Marino

objectives are business-oriented and need MIS support to make those objectives come true.

Forstrom: Yes, it is advantageous from the point of view of the [chief executive officer] and officers of the subsidiary. In their view, the MIS top executive should be a manager, and this would require him to have broader skills. As a participant in the strategic planning of the company . . . I am expected [not only] to contribute technical solutions to corporate problems, but [also to contribute] ideas from a business standpoint. Subsidiary presidents say I should know their businesses as well as they do in order to contribute technical solutions to the business problems that they have.

I have found that users do not understand how to apply technology to business, so they expect DP to understand their problems, such as in operations, marketing and business.

Huntington: Yes, the reason being that unless a DP or MIS manager has an idea of what's going on in the world around him, especially in application or user areas, he cannot really perform his job properly. He must be able to understand the needs of the user community.

Colby: It is important to have business skills in addition to having good managerial skills for my professional and technical people, especially at senior levels, where [they are] beginning to get much more involved in the business the company is in.

Does the need for an ability to look at the overall business picture apply to your technical staff as well as to you?

Grybowski: I believe it is essential that they get some background in accounting, marketing and psychology. When they get involved in applications, people can do a better job if they have an understanding of the users' requirements.

Marino: My own background is 20 years in DP and an additional 12 years in an operational production environment. Many of my supervisors, and especially my systems analysts, were brought in from user groups to be trained as MIS people.

We cross-pollinate. We have a program now that takes user analysts, teaches them DP and then sends them back to their respective departments to help us.

Forstrom: Partly yes and partly no. Some people need both, such as systems analysts and programmers. I have found that business programmers don't necessarily have to understand the implementation of what they do.

Huntington: I like my systems programmer management and operations management to know what is happening in the world outside hardware. If they approach applications with tunnel vision, they will not be as receptive to user needs and problems.

Colby: There is room for both technically [oriented] and business-oriented data processing staff. We need more than ever good technical people — next year we [in MIS] expect to experience growth of 15% to 20%. In some cases, there is no need for good technical people to be involved or to know about business plans. On the other hand, as we are called upon more and more to help end users, it becomes important to understand their business.

How are you handling business-oriented training for your technical staff members?

Grybowski: Our main way is to offer a tuition refund program and to encourage staff to attend evening classes. If they have a computer science degree, we recommend that they attend business classes, such as marketing or accounting. If they have a broad background in college, we try to expand them further, rotating them on different systems, such as marketing, manufacturing and accounting.

We use a combination of training methods. We do have manuals, which we supplement with on-the-job training. The quickest way to learn is probably to use manuals and team the person up with a more experienced staff member to get him accustomed to the particular job, then turn the job over to him and see how he does.

Marino: Since 1975 we have had an account with a company called Advanced Systems, Inc., in Chicago. We are a big user of its audiovisual devices. We started actually structuring the training program for systems analysis courses several years ago using its media. We put a lot of our systems analysts, programmers and technical people

(Continued on Page 14)

Computerworld will look new to you.

Effectively new.

Starting with your January 9th issue, you will see an updated look in *Computerworld*. It will be cleaner-looking, more organized, and easier to read.

You'll get the best of the old . . .

The organization of the paper will remain the same — organized into news, editorial, technical and In Depth sections. But, you'll see more graphics, a more readable typeface and — you'll get more indexes to the news contained within the weekly issue.

. . . and a lot that's new.

Expanded technical sections will feature columns by DP/MIS experts, by *Computerworld's* own editors and by DP/MIS executives who have implemented unique solutions in their own firms.

The redesign, *Computerworld's* first in seven years, is being carried out under the direction of Robert Lockwood, the nationally known newspaper designer whose credits include *The Christian Science Monitor, Chicago Sun Times, Allentown Morning Call, Philadelphia Bulletin, Dallas Morning News* and *Baltimore Sun*. He was the founder and first president of the Society of Newspaper Designers.

MIS MANAGERS

(Continued from Page 13)
through those courses.

We have staff meetings weekly, where all the higher level technicians sit in and describe their weekly activities, and I describe what's going on in the business world.

At my level, in this division, I report directly to the vice-president and general manager on the staff level with the other directors of the various functions. In addition to conventional systems programming and computer operations, I have a software and education group with a supervisor of education whose basic responsibility is to control the education of the 70-some people who work for me.

We also support highly professional organizations, such as the Data Processing Management Association and [the American Federation of Information Processing Societies, Inc.]. This program allows [technical employees] to go back to college to finish degrees or further their education — and it does not have to be computer science — and the company pays for it.

Furstrom: We provide some on-the-job training and education. We get people to spend time with the business people as much as possible. We encourage people to take university-level business classes, such as MBA or advanced-degree courses. We also provide in-house, video-assisted training.

Huntington: We have almost daily meetings with the user community to discuss how we can change things. It's an open dialogue where they can discuss problems they have, or perceive to have, with the DP center and address them and bring them out in the open.

We are primarily an IBM shop, and we send staff to IBM schools. Also, two members of the staff attend school at night in the computer science field. We also send operations managers to various IBM seminars for an exchange of ideas, to see what's new in equipment.

Many user departments hold seminars, which we attend when time permits. Unfortunately, that's not too frequently.

Colby: We talk about it some, of course. There are a number of professional [insurance] organizations that provide courses, such as the Life Office Management Association [Loma] and Charter Life Underwriters. The company pays for the Loma courses, subsidizes the books and provides a bonus upon passing each of the nine exams in the series.

We also have some insurance-related courses run by the personnel department. And we have a regular education center with its own entry-level courses and a couple dozen higher level courses.

In a more important way, we rotate assignments. We have a couple dozen people out at the moment, rotated out in user areas. This includes systems and management people who typically work an assignment for one to two years. They are dedicated to systems analysis and specification development of the user department, for example. In return, we'll take users into our area. Some users are in management jobs, such as systems management and directors.

Is the growth of end-user computing a major force behind the move toward general business education for technical staff members?

Grybowski: In some companies, end-user computing may force it, but in our particular company, we've always been user-oriented, and we've always gone the extra mile for the user to keep him happy. Most of our end users are in the engineering and technical [research and development] areas. There is some demand to hint there will be more growth in [end-user computing].

Marino: We've got a whole program going whose sole purpose is to introduce computing to the world outside of MIS. And to do that, it's kind of an information management concept, however, it's not that formal. We have a huge network of 300 CRTs that we are making available to users, including a variety of software products and applications and about eight personal computers in a few strategic areas. We are trying to develop a strategy for personal computing. I really don't see a lot of impact here, because a lot of my MIS people are going for additional education anyway.

Furstrom: We have a need to work with and assist a broad range of users on everything from the information center idea to personal computer ideas. The staff is assigned to do that. To a degree, although I don't know if it has a significant impact, it has caused a few people to have to understand business. Generally, staff systems analysts understand it anyway.

Huntington: We are just embarking on an office automation project where we are placing micros on 75% of the desks in the division — that is just starting up. Only the first 25 computers have arrived, and they are being installed on a top-on-down basis. I suspect this will underline the need for a business orientation, although as of yet we are not feeling any impact.

Colby: End-user computing is growing in leaps and bounds here. We have an information center with a couple hundred users, and it's growing at 100% a year. We find we are being called upon more and more to support this, to provide training and advice. Strangely, it has not adversely impacted the traditional central operations.

What's Hot! What's Not!

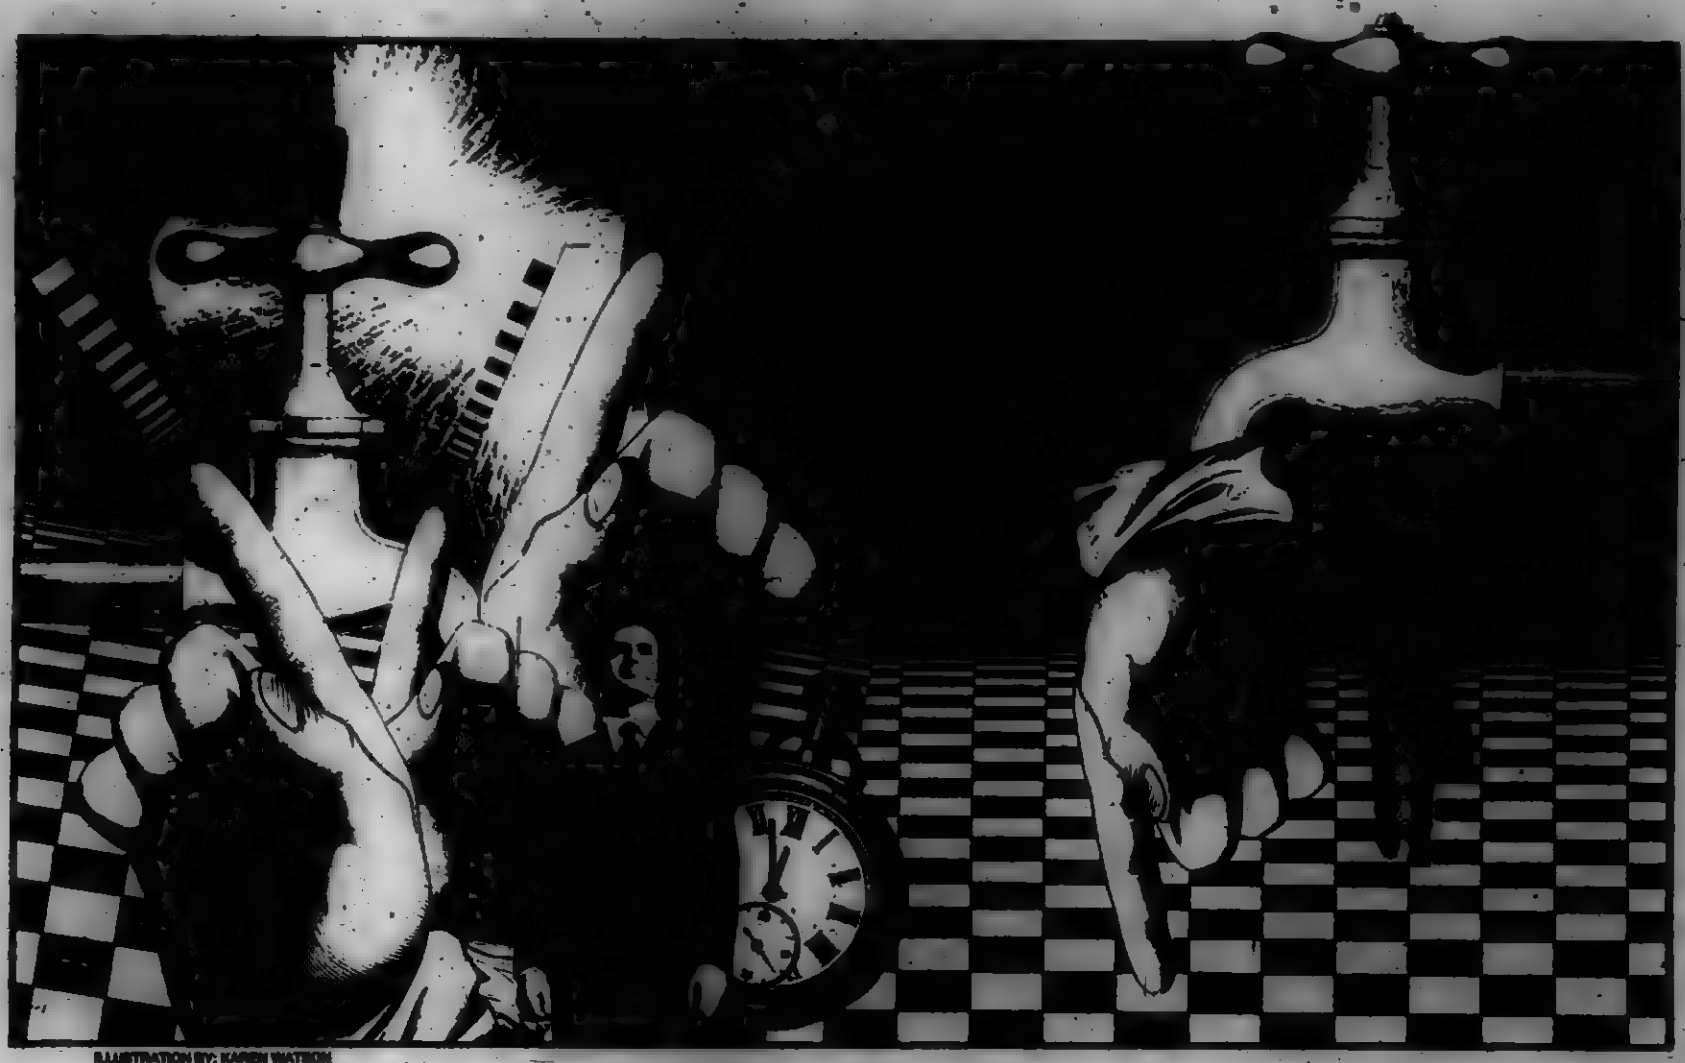

ILLUSTRATION BY: KAREN WATSON

By Jim Bartimo

Keeping track of the new products, technologies and buzzwords of the computer industry is as difficult as keeping track of the Top 40 hits in popular music — as soon as you get used to one, another one comes along to replace it.

In the ongoing effort to keep our readers up to date on new trends, *Computerworld* has compiled this list of upcoming and outgoing technologies as a guide for the confused. Readers are advised to use this list as but one source of information on an ever-changing industry.

What's Hot in Chip Technology

Digital Equipment Corp. last summer invested $26 million in Trilogy Ltd., a company promising to bring wafer technology to the computer industry [CW, Aug. 8]. Promising high reliability, wafer technology places all circuitry on a single 2½ sq-in. wafer instead of wiring hundreds of individual chips to boards. "We always talk about high tech, but this is an order of magnitude higher than high tech," according to David Dell, director of research services at the Diebold Group in New York.

Perhaps another few orders of magnitude higher than wafer technology is the **biochip** — the computer industry's attempt to turn living organisms into microchips. Some predictions call for a reduction in size by 500 times from current silicon chips, but others say the chips could be 30 years in the making.

Biochips are made from existing biosystems, such as large protein molecules, to produce electronic circuits and switches or by synthesizing an electron-trained molecule from scratch. Suspiciously close to reproducing the human brain, biochips would prove a boon because "the processing capacity of your brain is more dense than any chip," according to Kenneth Bosomworth, president of International Resource Development, Inc. (IRD), a Norwalk, Conn.-based market research firm.

What's Not Hot

If IBM, Bell Laboratories and Sperry Corp. say **Josephson junction circuits** are dead — they're dead. Research attempts to supercool circuits to reduce resistance and increase speed were dropped by all three organizations last year, short-circuiting British physicist

(Continued on Page 16)

Jim Bartimo is a senior editor/communications for Computerworld.

WHAT'S HOT AND WHAT'S NOT

(Continued from Page 15)

Brian Josephson's idea [CW, Nov. 14]. Silicon and gallium arsenide technologies are still best bets for the immediate future of processors.

What's Hot in Systems

There are 675 micro hardware products on the market today and 154 manufacturers, according to IRD. The microcomputer has hit the industry with a force strong enough to support some 100 microcomputer publications and employ countless third-party software developers. The question still weighing heavy on everyone's mind is: When will the micro market turn cold?

What's Not Hot

DEC stock last autumn took a one-day plunge of 21 points, following in a more drastic manner the lead of other minicomputer makers such as Data General Corp., Prime Computer, Inc. and Datapoint Corp. While the minicomputer will be with us for some time, it will most likely be best utilized in specialized niches such as office automation and engineering — leaving distributed data processing in the hands of its smaller brother, the micro.

What's Hot in Displays

Whether it turns out to be electroluminescent, liquid crystal or plasma, flat-panel displays will account for 50% of the computer displays within three years, according to Boscomworth. Since the general shape of things in the computer industry is tending toward miniaturization, the compaction of the CRT's footprint would be a natural development.

The IBM Personal Computer is hot.

The 5-in. display was hot in the days when Adam Osborne and his staff first showed it off. It's not hot anymore.

What's Not Hot

Adam Osborne will tell you — 5-in. display screens can be hazardous to your health. While his computer's peephole display screen wasn't the only reason his company filed for protection under the Chapter 11 bankruptcy statute [CW, Sept. 19], it didn't help.

What's Hot in Storage Technology

Boasting 4G bytes of storage and sometimes even more, one optical disk storage system can store the entire *Encyclopedia Britannica* if necessary. Optical disks grew out of the entertainment industry's marketing of movies to the home and, as a result, can store images as well as digital information.

While there are numerous applications for document storage already in place today, 1984 could well see a boom in erasable optical disks that are interchangeable with magnetic disk drives. "If there's a breakthrough in cost for erasable disks, they'll naturally take off," according to Hank Koehn, director of futures research for the Los Angeles-based Security Pacific Bank.

Vertical recording technology strives to stand magnetic bits of information on end instead of side by side on a disk as they are today. According to Diebold's Dell, this would have a compacting effect, leading to 4 billion bytes on one disk by 1985 and 15 billion bytes on a disk by 1990. "They wouldn't

COMMUNICATE WITH CECOM

For micro to mainframe communications, talk to Cecom, the nationwide specialists in software and hardware links between mainframes and personal computers. Cecom puts uploading and downloading of data as well as file sharing at the fingertips of your personnel while maintaining the data integrity and system security you require. That means improved communications through the complete interaction and integration of the micros in your organization.

If it's an entire system you need, talk to Cecom. With offices from coast to coast, Cecom also does total system and network configuration, re-engineering, and refurbishing to put together the communications package you need.

"If you want to do OEM computer business in the U.S., you'd better go to the Invitational Computer Conferences in Boston, Dallas, Minneapolis, Orange County, Washington, D.C., Los Angeles, Ft. Lauderdale, ...We do!"

Experienced marketing management knows that the best way to reach the technical decision maker/buyer is to meet him where he lives and works, demonstrate operating equipment and provide him with the technical information he needs. Over the past 12 years successful marketers have found the Invitational Computer Conferences to be the most cost-efficient, effective method of covering their U.S. computer industry customer base.

The exclusive, one-day OEM conferences will be held in ten major market areas throughout the United States and are attended by a select, invited audience of OEM's, systems houses and quantity end users. Guests can attend a variety of technical seminars and view operating displays of the newest computer and peripheral equipment. The informal setting makes it easy to meet with potential customers one-on-one and the simple tabletop displays keep exhibit costs at a minimum.

WHAT'S HOT AND WHAT'S NOT

look a hell of a lot different, but there would be 100 times the density [of information]," Dell said.

What's Not Hot

Last year at this time, microcomputer users were barraged with multiple sizes in disk drive offerings, and many wondered which one would end up being the standard. Now, it looks like the use of 8-in. disk drives and 3½-in. disk drives will not reach widespread use in the microcomputer market. With even advanced micros such as the Apple Computer, Inc. Lisa settling on 5-in. drives, the micro market has at least one standard by which to live.

What's Hot in Memory

"Nonvolatile" will be the name of the memory game next year, and the winner in the portable terminal and computer market will remain Cmos. Currently featured in notebook computers from Radio Shack, Epson America, Inc. and NEC Information Systems, Inc., Cmos allows internal memory to remain intact with a power source as small as four AA batteries. "The price is coming down and will continue to drop by 40% per year," Dell predicted of Cmos.

What's Not Hot

A clear parallel to Cmos is magnetic bubble memory, which utilizes no power source at all to maintain memory, but instead relies on magnetic bits to line up in rows after the power source is shut down. What's the problem with magnetic bubble? Its high price tag has not captured the support of many vendors, and a lack of vendor support has lead to a continued high price tag.

What's Hot in Software

"People in the home and in business don't have the time to fool around with software," Koehn said, so windowing capability and integrated software packages are among the hottest items in software.

Introduced by Xerox Corp. in its office automation workstation, the Star, windows allow the user to treat the computer screen like a desktop where various files can remain open simultaneously. Third-party software houses such as Visicorp have developed windowing for the IBM Personal Computer, and the Apple Macintosh (when introduced in January) is predicted to feature similar windowing to the company's Lisa.

Keeping the users' needs in mind, integrated software — such as that found in Lotus Development Corp.'s 1-2-3, Sperry Corp.'s Sperrylink office system and DEC's All-in-One software — allows users to transfer data, text and graphics easily from one file to another. If Comdex/Fall '83's 20 introductions of integrated packages is any indication, this type of software will remain popular throughout the next year [CW, Dec. 5].

What's Not Hot

With integrated software and powerful data processing available for under $10,000 with a microcomputer, hooking up a dumb terminal to a remote host in a time-sharing configuration has become less and less necessary. "The next five years will see an almost total disappearance of the raw computer utility concept," Ed Metz, senior vice-president at Input, Inc., told *Computerworld* last September.

What's Hot in Communications

Last year was the year of the nonblocking private branch exchange (PBX) telephone system, which promised the ability to switch data and voice with equal efficiency. Dubbed "the next-generation PBX," nonblocking architectures, such as those from Intecom, Inc., Ztel, inc. and finally Rolm Corp., suggested that local-area networks could be best

achieved through existing telephone wiring.

Nonblocking "allows one port access to every other port," according to Edward Horrell, president of the Memphis, Tenn., consulting group, Mitchell & Horrell, Inc. "Now that data is on the line as well as voice, nonblocking is important because data can't tolerate the delays that voice can."

Industry pundit Dixon Doll, president of the DMW Group, Inc., predicted that "every vendor planning to offer voice and data switching will commit to nonblocking."

What's Not Hot

There is no shortage of reasons why video teleconferencing is not taking off as was once expected. While teleconferencing was predicted to cut travel expenditures by allowing video meetings to take place over data lines, the unfamiliarity of the technology seems to be too much of a hindrance.

"We have a lot to learn about how people interact," Koehn said. "People become controlled, and there's less friendly banter with videoconferencing. There's also a lot of nonverbal signaling going on [that isn't picked up through teleconferencing]."

What's Hot in Computer Crime

The movie *War Games* did more for the reputation of computer hackers than any teenage whiz kid could have in his best system-cracking days. The media jumped on almost every prosecution — including the 414s and the Wizard of Arpanet — with an unusual fervor [CW, Sept. 12]. Why the sudden interest in hackers? If these kids can crack these systems, perhaps computers are not so threatening to the public after all.

What's Not Hot

For the sixth year in a row, the U.S. Congress has failed to act on a federal computer crime bill that would make the misuse and abuse of computers a federal crime. While Rep. Bill Nelson (D-Fla.) vowed at the start of the congressional session to push through the controversial H.R. 1092, the bill never got any further than subcommittee hearings [CW, Nov. 28].

Micros And the End User

A Passing Fancy?

By Jeffry Beeler

The sometimes sweet, sometimes stormy romance between big business and small computers is entering a new phase in its evolution—a development that confronts management information systems (MIS) directors with significant management and technological issues as they look ahead to 1984.

Only a few years ago, the question that dominated conversations among prospective buyers of commercial personal computers went as follows: Are microcomputers just a passing fancy, mesmerizing but hopelessly impractical playthings, or will they take their place alongside other business machines in large corporations and prove their mettle in serious, demanding applications?

Jeffry Beeler is a Computerworld West Coast correspondent.

Since then, the question has been answered with resounding finality. What began between big business and personal computers as a harmless flirtation and progressed into casual courtship has blossomed into a passionate love affair and is now hurtling inexorably toward engagement and a rendezvous at the altar. At the least, the pair is already openly cohabiting, as evidenced by the growing list of Fortune 1,000 companies where personal computers are invading work places by the hundreds and thousands.

But today, the focus of concern in the big business-personal computer relationship is beginning to shift to a second, perhaps even more urgent, question: Will the union work? More importantly, will the once-promising marriage ultimately prove a mismatch, leaving both sides permanently scarred and plunging them into discord?

The answers to the above questions may take years to fully reveal themselves, although some tantalizing clues have already begun to emerge and no doubt will continue to do so as 1984 progresses.

In the meantime, opinion on the subject remains sharply divided. Some industry observers — including Dr. Lew Glendenning, director of information systems research at San Jose, Calif.-based Strategic, Inc. — view the future of business microcomputing fairly optimistically. Citing the results of his own company's recent market research, Glendenning credits personal computers with already having cut large companies' costs, boosted worker efficiency and productivity and won "strong [user] support." He also cites fresh research findings to support the frequent vendor claim that

(Continued on Page 20)

MICROS AND THE END USER

(Continued from Page 19)
micros can make major inroads into the big business world's huge application backlogs — a serious problem that has defied solution for years.

Echoing Glendenning's optimism on the application backlog question is Connecticut Mutual Life Insurance Co. Vice-President Ted Stein, who bases his opinion on his own firm's recent experiences with 1,000 networked IBM Personal Computers. "Many of the programs that [corporate computing departments] have never gotten around to developing are small and personal and are the sort of thing that end users could frequently do themselves," he said.

"So if they have the right hardware and software tools at their disposal, users will be able to ease the application backlog because they know the subject matter in question much better than any programmer or systems analyst."

Not everyone, however, views the future relationship between large corporations and personal computers quite so rosily. One such skeptic is independent DP consultant Gopal Kapur, who foresees an impending information systems crisis unless big businesses speedily supplement their microcomputer acquisitions with significantly improved management techniques.

For years, Kapur said, most large user organizations have woefully neglected to impose strict standards and sound management procedures on their in-house software development operations. The unfortunate result has been programming projects that all too often exceed their budgets, miss their implementation deadlines and produce systems that either reek with errors or fail to work as expected.

Although the absence of standards and effective management has caused untold grief, the situation offers at least one minor consolation: Because most programs until recently were written exclusively on mainframes, with all their inherent inefficiencies, systems-related catastrophes could usually be counted on to develop at a reasonably sedate pace. But with the recent proliferation of micros, the speed with which applications or data can go seriously awry has been dangerously accelerated.

"It's a little like having a berserk person running around inside your organization," Kapur said. "If you give the person a baseball bat, he could hurt a lot of people. But think how much more harm would be done if you gave the same individual a machine gun." Thus, in the absence of careful control over software-development activities, personal computers threaten to aggravate greatly the very problems they were expressly designed to solve.

The mass importation of microcomputers into the big business arena may also stimulate another potentially harmful trend — an increased willingness by nontechnical end users to "decouple" themselves from their corporate MIS organizations, Kapur said. After years of abuse and neglect at the hands of their DPers, many users are increasingly looking to micros as their deliverance.

Another personal computer problem that will grow in importance during the coming year is the issue of end-user training, which many corporations thus far have sorely neglected, according to Microcomputer Managers Association founder James Haner. Snowed by a recent spate of television advertising campaigns, many computing novices have been misled into believing that they can learn to use their micros in a matter of minutes.

If the training issue is not addressed, commercial personal computers may receive "only about one hour of use per month rather than 10 hours every week," according to Aaron Goldberg, research manager for International Data Corp. of Framingham, Mass.

Fill in your IBM micro/mainframe communications picture.

AST Research, the leader in IBM PC enhancement products, brightens your micro/mainframe communications picture with a full palette of economical, integrated hardware/software masterpieces. With AST Products, you can emulate IBM terminals or create PC-based Local Area Networks.

AST improves your office operating cost picture.

AST communications products give your IBM PC the flexibility to act as a terminal for your host system or as a stand-alone computer for smaller tasks. Your PC won't bog down the mainframe with unnecessary small jobs and local computing on the PC eliminates phone line charges too. Get the power of a mainframe when you need it and personal computer convenience right at your fingertips.

Applications solutions that are shrines of genius.

AST keeps pace with your ever-changing applications requirements with reliable, high quality, cost effective communications products. AST products provide support for Bisync and SNA/SDLC communications protocols as well as networking multiple PCs for sharing resources.

Choose AST products — by the numbers.

These AST communications packages are currently available:

1. AST-SNA™ emulates a 3274/3276 controller and 3278 or 3279 display terminal using SDLC protocol.
2. AST-BSC™ emulates 2770 batch RJE and remote 3270 display terminals using 3270 Bisync protocol.
3. AST-PC3X™ allows your PC to connect to an IBM 3274/3276 cluster controller via coax cable and emulates a 3278 or 3279 display terminal.
4. AST-3780™ emulates 2770, 2780, 3741, and 3780 RJE workstations using Bisync protocol.
5. AST-5251™ emulates a 5251 Model 12 remote workstation connected to an IBM System 34, 36 or 38.
6. PCnet™ is the first Local Area Network designed specifically for the IBM PC or XT and the PC-DOS 1.1 or 2.0 operating system.
7. DC-232™ is a user-programmable dual-port card-cassette™ communicating in Async, Bisync, SDLC or HDLC protocols.

Discover how well AST can fill in your micro/mainframe communications picture. For descriptive data sheets, write or call: AST Research Inc., 2121 Alton Ave., Irvine, CA 92714. (714) 863-1333. TWX: 2953708ASTRES

MICROS AND THE END USER

Will Apple Steal IBM's Micro Mart Thunder?

By Tam Hamlet
CW Staff

IBM dominated the microcomputer market during 1983. And it will probably do the same in 1984.

In addition to major IBM announcements, such as the 3270 Personal Computer and the Personal Computer XT/370, the Personal Computer and Personal Computer XT were doing so well that IBM could not keep pace with the demand.

The situation spawned a host of vendors willing to manufacture anything that could be plugged into an IBM micro, including IBM-compatible disk drives, memory expansion boards, printers, plotters, tape drives and keyboards.

By all predictions, 1984 will bring much of the same. But Apple Computer, Inc. may try to steal IBM's thunder.

For Apple, 1984 may be a make-or-break year. While IBM has been wallowing in the success of its Personal Computer, sales of Apple's latest entry, the Lisa, have been less than impressive. Prospective buyers have shunned the Lisa, contending the machine is too expensive, is incompatible with current Apple systems and does not offer easy access to IBM mainframes.

According to Michael Killen, president of Strategic, Inc., a Santa Clara, Calif., market research firm, IBM's success — and Apple's lack of it — is a classic case of good product marketing over bad.

According to Killen, Apple made an incredible blunder when it announced the Lisa, a processor that originally cost about $10,000 (it now costs about $8,000). Current Apple users could not upgrade to the Lisa, and new users were hesitant to make a heavy investment in a machine that did not offer IBM compatibility, he explained.

"The Lisa is going to dangle out there," Killen said, comparing the processor to the earlier, somewhat ill-fated Xerox Corp. Star, an intelligent workstation that offers capabilities similar to the Lisa, including multiple windows and business graphics. The Star was announced in 1981 with a $16,000 price tag. So far, industry watchers agree, the Star has not been a successful product for many of the same reasons the Lisa has not been a hot seller.

Noting that many corporate micro users also use IBM mainframes, Killen said, "I can't see any IBM shop getting involved with another family of machines, like Lisa, when it can buy a carload of machines for the [Personal Computer]."

Apple is expected to ring in 1984 with a flurry of product announcements, including the much-touted Macintosh. Some industry watchers believe the early 1984 announcements are Apple's attempt to lash back at IBM.

The Macintosh, according to Ralph Wagner, president of Microsource Financial, Inc., a Watertown, Mass., computer dealer, will do everything the Lisa can do for around $3,000. Other industry watchers, such as Tod Corenson, a vice-president at Eaton & Associates, a Cupertino, Calif., market research firm, feel the Macintosh will be the entry-level Lisa now missing from the Apple lineup.

In either case, the Macintosh appears to offer Apple stronger ammunition for landing corporate accounts. The question is whether the Macintosh will meet analysts' and users' expectations and whether Apple can successfully market the device to raise corporate eyebrows.

Lisa Enhancements

Apple is reportedly planning enhancements to the Lisa. Corenson said planned enhancements include: a rewrite of the Lisadraw graphics package that is said to be four times faster than the currently available version; a revision of Apple's Pascal compiler; and the availability of Xerox's Smalltalk operating environment on the Lisa. The addition of IBM compatibility, such as a linkup to IBM's Systems Network Architecture, would also improve Lisa's image among corporate accounts, Corenson noted.

Apple's Achilles' heel appears to be a lack of presence in Fortune 500 firms.

"We've had the best year ever in terms of volume with Apple," Wagner said. But he quickly noted many of those sales were to public schools and not corporations.

However, IBM has its problems, too. While IBM appears to have gained control over the largest corporate microcomputer accounts, "there is an absolute finite supply of products from IBM," Wagner said. Pointing to the almost weekly announcements of IBM-compatible microcomputers, Wagner said IBM's delivery problems tend to give competitors about a year to develop competing products.

WHEN YOU'RE READY
OUR PC PLUS KIT
WILL BE WAITING

10mb Internal Upgrade

When you're ready to boost your storage capacity from 640K to 10mb without boosting power and without eating up desk-top space, our internal PC PLUS will be just a phone call away.

Waiting to give you all the capacity of the *XT at a price that saves you hundreds of dollars compared to the cost of trading up.

The DSS PC PLUS kit uses a half-height 10mb Winchester disk drive that gives you all the benefits of Winchester technology — increased data integrity, faster access — without taxing the power supply. It also includes a Winchester disk controller that is *IBM formatted.

The DSS PC PLUS kit presents the storage solution you need now. What are your data storage needs? At DSS, we do much more than sell components. We create solutions.

The DSS PC PLUS kit includes:
— 10mb half-height disk drive
— DSS Controller
— Full height front bezel
— Mounting hardware
— Cables

Features and Benefits
— *Increased capacity*
— *Increased access time*
— *Upgradeability*
— *No additional power requirements*
— *Enhanced cooling*
— *One board controller solution*
— *Operates with 1.25 MS-DOS through 2.0 MS-DOS*
— *Internal upgrade*
— *1 10mb half-height Winchester = 31 floppy's*
— *Increased data integrity*

Retail price: $2250

Micro-Mainframe Links

PHOTO © 1984, GEORGE DILLON

Making the Connection

By Paul Gillin

The wait is almost over.

The micro-mainframe link — the great software buzzword of 1983 — is set to become a widespread reality in 1984. Rarely has a single software technology so captured the attention of the computer industry. And probably never before has a largely unavailable technology been the subject of so much anticipation and speculation.

The micro-mainframe link was the subject of dozens of product announcements in 1983 by companies that included four of the top five independent packaged software vendors and both of the leading makers of microcomputer spreadsheet packages. However, with most of the products not scheduled to be available until early 1984, the opportunity to evaluate the various approaches has not yet been realized.

The clamor for such products is not surprising. The 1982 installed base of 1.6 million microcomputers in corporate environments is expected to grow to more than 19 million by 1985, according to International Data Corp. (IDC), the Framingham, Mass.-based market research firm.

The user demand for access to business data has sent DP managers scurrying to find any way to tie micros into their corporate mainframes. International Resource Development, Inc. (IRD), located in Norwalk, Conn., predicts that users will spend more than $500 million on micro-mainframe communications in 1984 [CW, Dec. 5]. An IRD study found that nine out of 10 Fortune 500 companies surveyed were either implementing or seriously studying programs in this area.

So far, the demand for link products has outstripped the ability of most vendors to respond with technically sophisticated offerings. The links announced this year have taken nearly as many forms as the vendors offering them. And while many claims have been made, relatively few products have actually been delivered. Those that have been unveiled are only a first step in what observers believe will be a flood of very sophisticated links that will become available over the next few years.

The end result may be a shakeout

MICRO-MAINFRAME LINKS

(Continued from Page 23)
in the market for micro-mainframe links that could severely affect those vendors whose technology does not offer significant added value over and above the early "vanilla" links, which were essentially terminal emulators.

But despite the problems that lurk down the road, those vendors who delivered links this year have found them enormously successful.

Management Science America, Inc. (MSA), which was the first mainframe software vendor to enter the market when it introduced its Peachlink in December 1982, attributes more than $5 million in combined mainframe and micro software sales directly to the link's introduction. McCormack & Dodge Corp., which began delivering its PC Link package in July, has chalked up more than $2 million in sales of its link alone.

"Many users are buying our product without even looking at it," commented Robert Weiler, McCormack & Dodge's vice-president of marketing. "They buy it because they like our company, and I'm sure the same applies to MSA."

Stamp of Approval

As in the personal computer market, it was IBM that legitimized the micro-mainframe link concept this year with its October announcement of the 3270-PC and the Personal Computer XT/370.

The 3270-PC, which is the more end-user-oriented of the two products, offers the ability to run concurrent applications from multiple mainframes in a terminal emulation mode using windowing techniques.

David Ferris, chairman of Ferrin Corp., a San Francisco-based personal computing support firm, called the IBM 3270-PC "numerically the much more important announcement. Large companies have been holding off on [IBM] 3270 purchases and getting terminal emulators instead. But a lot of them would prefer to wait and buy that emulation directly from IBM."

The two announcements "have echoes that will be with us for a long time," added Thomas O'Flaherty, a principal consultant with Input, Inc. in Saddle Brook, N.J.

In addition to establishing itself as a vendor of a full line of communicating hardware, IBM has set a bar over which all other competitors must leap, O'Flaherty said. "This will have vendors worried because they'll always be a couple of steps behind IBM," he stated.

For the moment, however, competitors are welcoming IBM's endorsement of the linkage concept. "IBM is telling us people will want to access mainframe data, so it can't help but improve the market," McCormack & Dodge's Weiler observed.

He believes the link market is beginning to resemble the packaged application software field of the late 1960s, when IBM's endorsement opened the door for independent vendors who provided improved functionality over the Big Blue offerings.

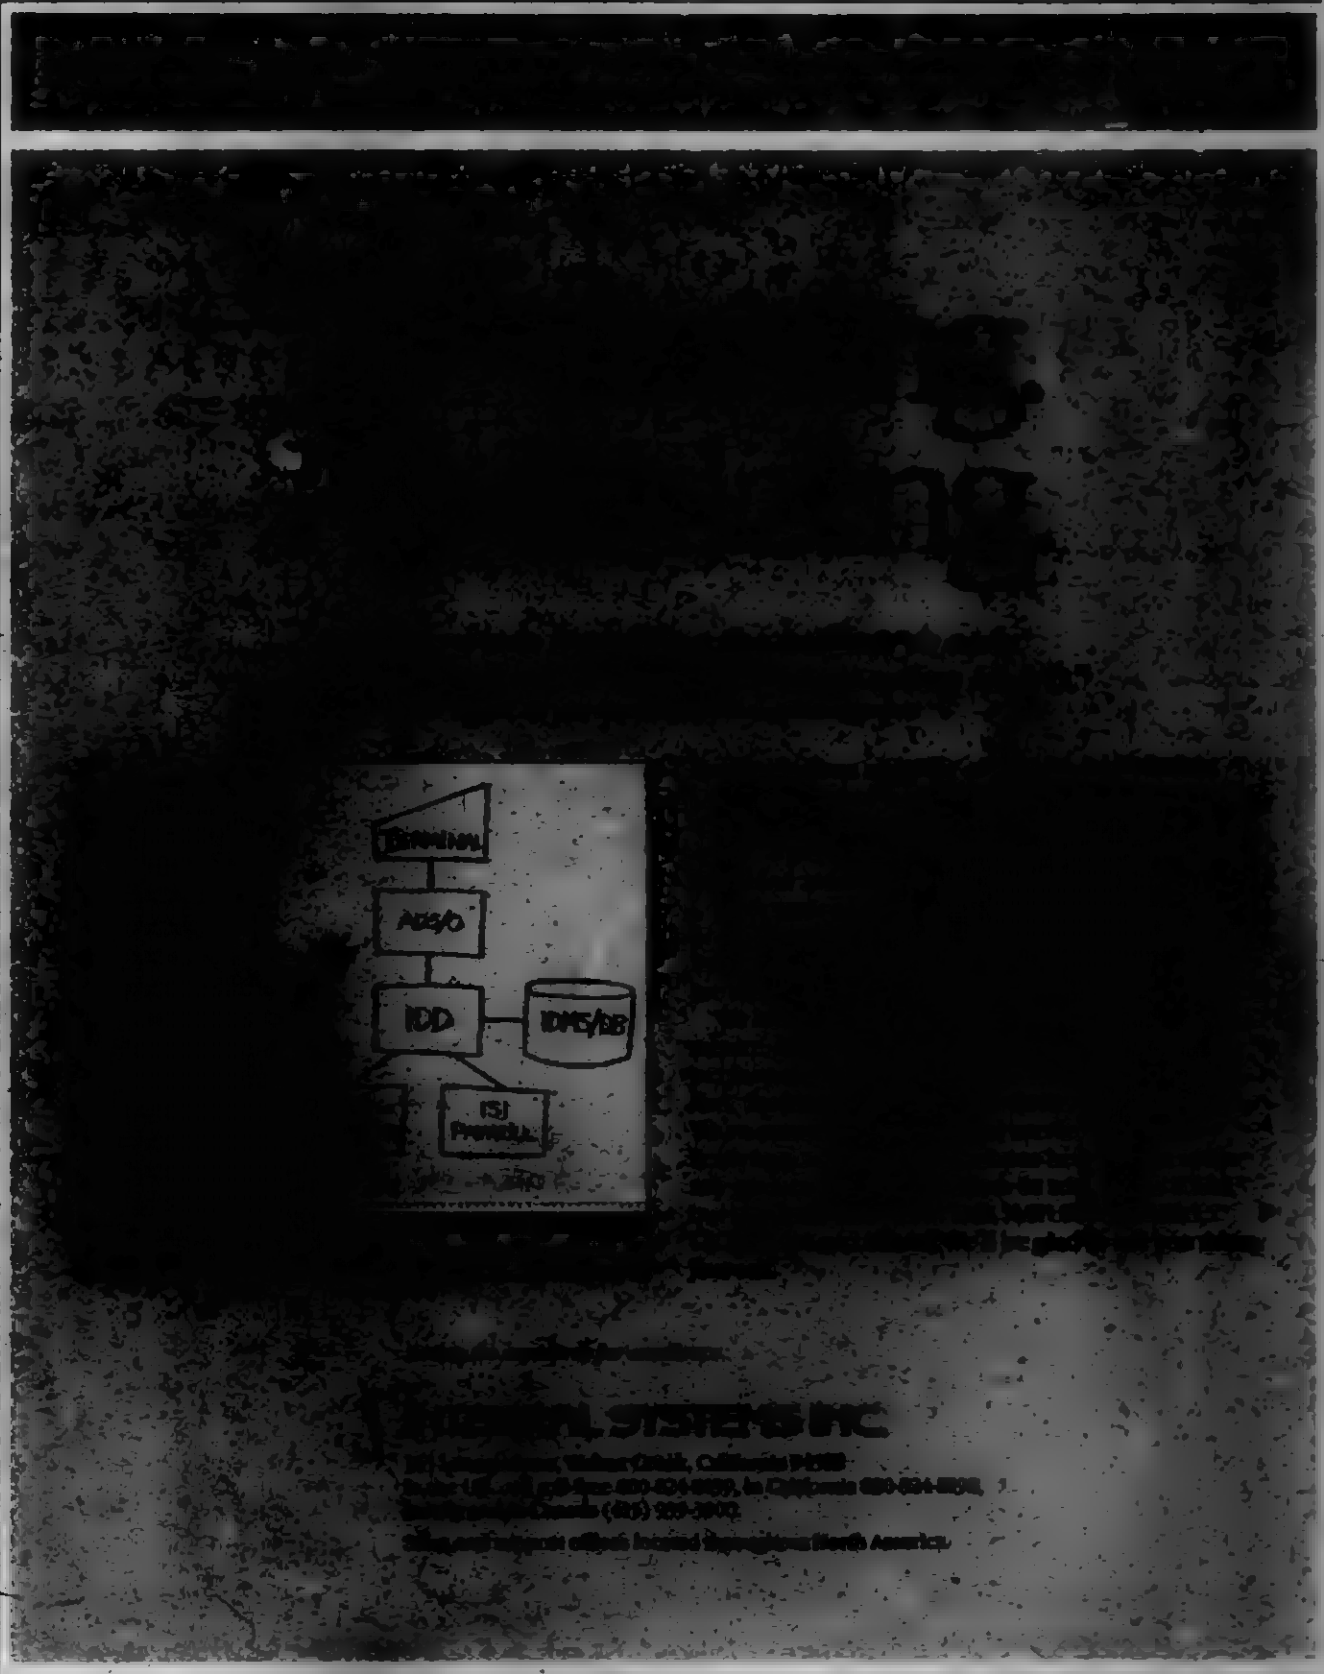
"The key for us," Weiler said, "is to stay ahead of IBM technically and to offer attention to the individual customer. That's what made the independents flourish in the first place."

Four Categories

Micro-mainframe connections currently fall into four general categories, according to "Communications Software: Forging the Micro-to-Mainframe Link" from IDC. These include:

- Dumb terminal or terminal emulation, allowing transfer and receipt of data in the host format.
- Data download, in which the data from the host becomes a file stored locally on the microcomputer.
- Information download, in which files are structured and formatted for a specific purpose.
- Active information extraction, in which software

(Continued on Page 36)



MICRO-MAINFRAME LINKS

(Continued from Page 25)

on both host and microcomputer allow the user to select the desired data.

A host of terminal emulation and download products are now available for nearly every large system and most micros. But the major announcements of this year have fallen into the latter two categories, with each vendor offering its own unique capabilities.

MSA's Executive Peachpak II, for example, allows real-time downloading of multiple "mini data bases" on MSA mainframe applications directly into a format that can be run on several popular microcomputer packages.

Data Extraction

Visionswer-Answer/DB, a jointly announced product from Informatics General Corp. and Visicorp, allows the IBM Personal Computer to extract data from a variety of different data bases. Applied Data Research, Inc. (ADR) and Visicorp's Vision-based software integrates Visicorp applications with 10 ADR mainframe products including data base management, decision support, program development and office automation.

Computer Corp. of America's PC-204 offers a transparent user interface and automatic reformatting of mainframe files on the company's Model 204 DBMS to run on Lotus Development Corp.'s Lotus 1-2-3. McCormack & Dodge's Interactive PCLink allows real-time uploading of Personal Computer files to update the mainframe data base.

Cullinet Software, Inc.'s Personal Computer System features proprietary IBM Personal Computer software tied to an extracted data base on the mainframe, offering virtual mainframe storage, communication between microcomputers via the extracted data base and an indirect interface to other data base management systems.

These products give users a broad and diverse range of options from which to choose. Yet some significant shortcomings are already becoming apparent, observers say.

"The most glaring shortcoming is that they're not really out there," observed James B. Rothnie Jr., executive vice-president of Computer Corp. of America. "The shape of the market will be a lot different in 1984, after the users get some experience."

Satisfied With Less

O'Flaherty noted that despite vendor claims of technically elegant features, most users for the moment will be satisfied with far less. "Many people in DP are frightened of having users roam around in their on-line files, anyway," he said. "Right now the most important features are simple file transfers. We have to walk before we can run."

Mac Lewis, president of Systems Center, Inc. in Irving, Texas, pointed to the reliance of most links on terminal emulation as a fundamental weakness. "Most of the products are using the [Technical Analysis Corp.] Irma board, which allows the [personal computer] to plug via a coaxial cable into an [IBM] 3274 cluster controller," he said. "That limits the mainframe to having to deal with [IBM] 3270 data streams. All they can really transfer effectively is text-type information."

Lewis believes the next major innovation to come down the micro-mainframe pike will be a tie into IBM's Systems Network Architecture to allow loading of entire control blocks including binary data. Such a capability could overcome the problem posed by terminal emulation that requires data to be re-keyed or reformatted in order to fit

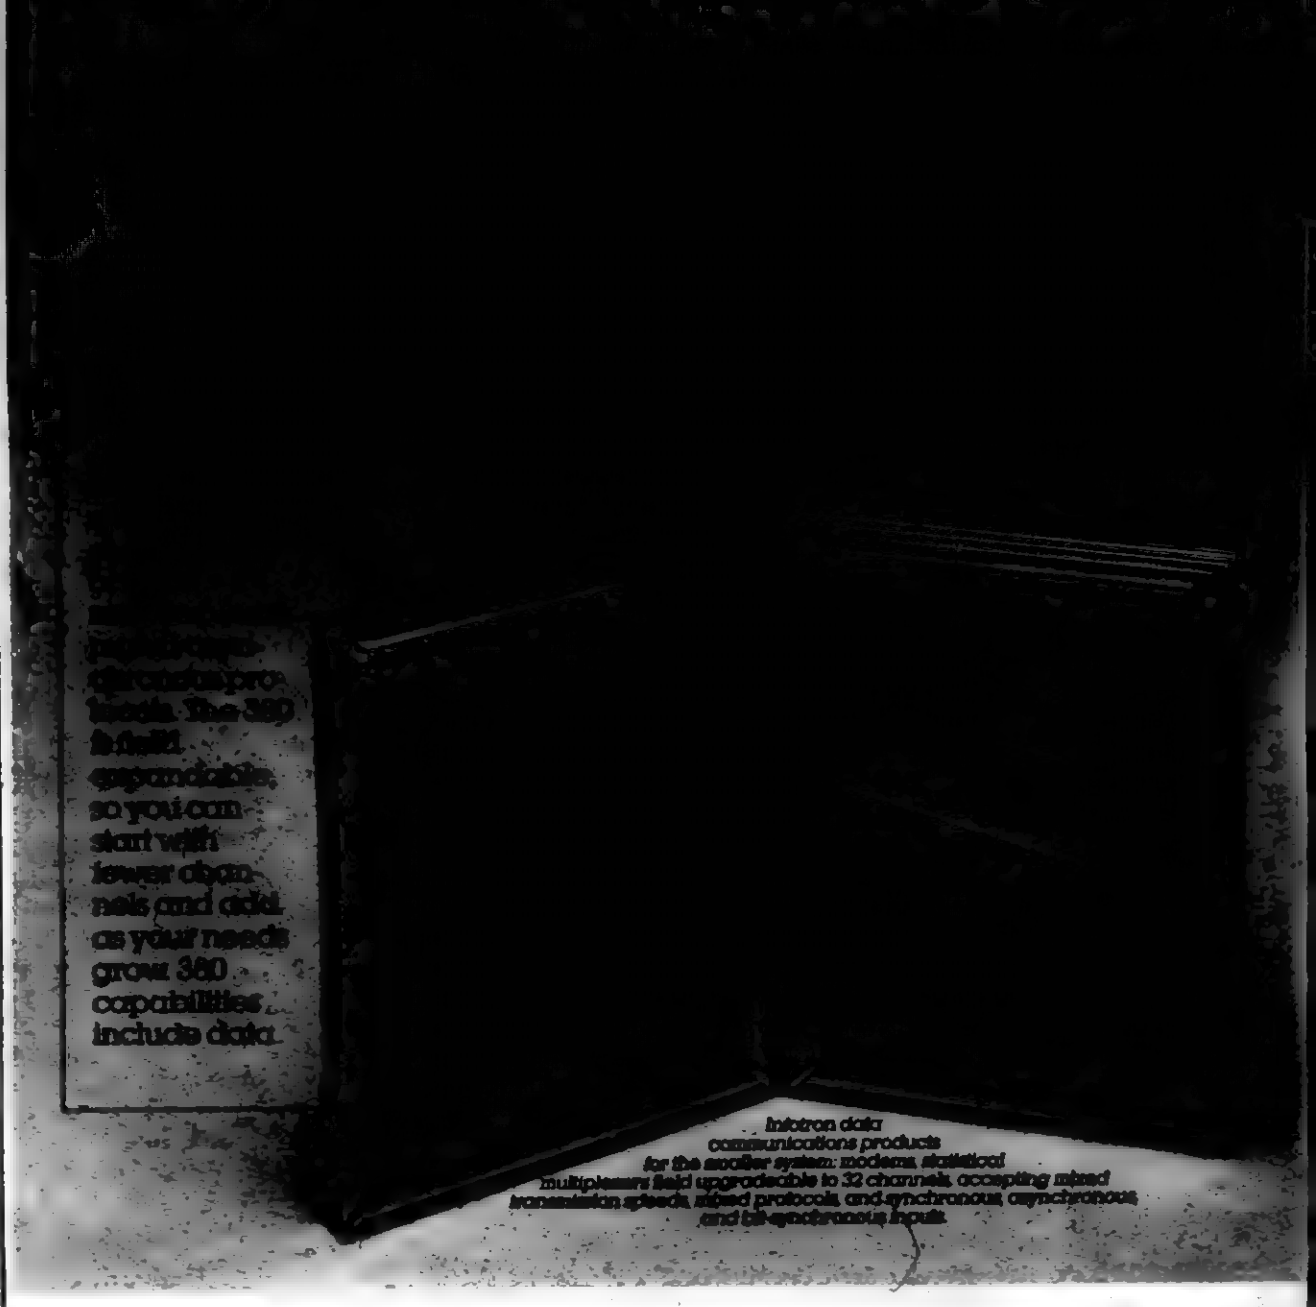
IDC Chart

Independent Packaged Software Vendors Offering Micro-to-Mainframe Links

How to put yourself into data communications And still keep tomorrow



Intotron data communications products for the smaller system: modems, statistical multiplexers field upgradeable to 32 channels, accepting mixed transmission speeds, mixed protocols, and synchronous, asynchronous and bi-synchronous inputs.

MICRO-MAINFRAME LINKS

(Continued from Page 26)

into the micro application. It could also allow applications to be exchanged between the micro and mainframe or other micros in object code without the need to recompile at either end, he said.

The IDC report points to the lack of a "universal" link as a potential future stumbling block. "There is no doubt that current announcements are attempts by vendors to preserve/extend/protect their current base of users," the report stated. "How long they will be able to hold out against the development of a truly universal link is open to speculation."

So far, the Informatics/Visicorp product is the only "intelligent" link that attempts to meet that criterion. However, it is limited by the requirement that it run under IBM's IMS/DC teleprocessing monitor. The IBM 3270-PC is also a first step toward providing a link to disparate kinds of data. "The world badly needs a way of addressing various kinds of mainframe organizations," Ferris said.

'Untapped Field'

The micro-mainframe market of the future may evolve into one dominated by IBM or several independents offering a horizontal link to various data bases. "There is an untapped field for generalized links," Rothnie said.

It will be complemented by many independents selling links that include intelligent features built around individual packages. "The vendors of applications software, in particular, will have a niche because they can make it very easy for the data base administrator or the user to get at their data," Ferris commented.

Right now, the most important factor is time. With most of the major new link products due to be available within the next three months, users are just preparing to get their feet wet. A look back next year may reveal a new crop of untapped needs and yet another swing in the software market.

Link Products Spur Predictions

As the software industry prepares for the first round of reactions from users of microcomputer-to-mainframe link products, observers are speculating about some of the new issues that may emerge.

"In areas in which a lot of sensitive information is involved, the physical security of diskettes in the office will be an issue," predicted James B. Rothnie Jr., executive vice-president of Computer Corp. of America. "On a terminal, users see information in a very ephemeral way. They're not used to worrying about these things."

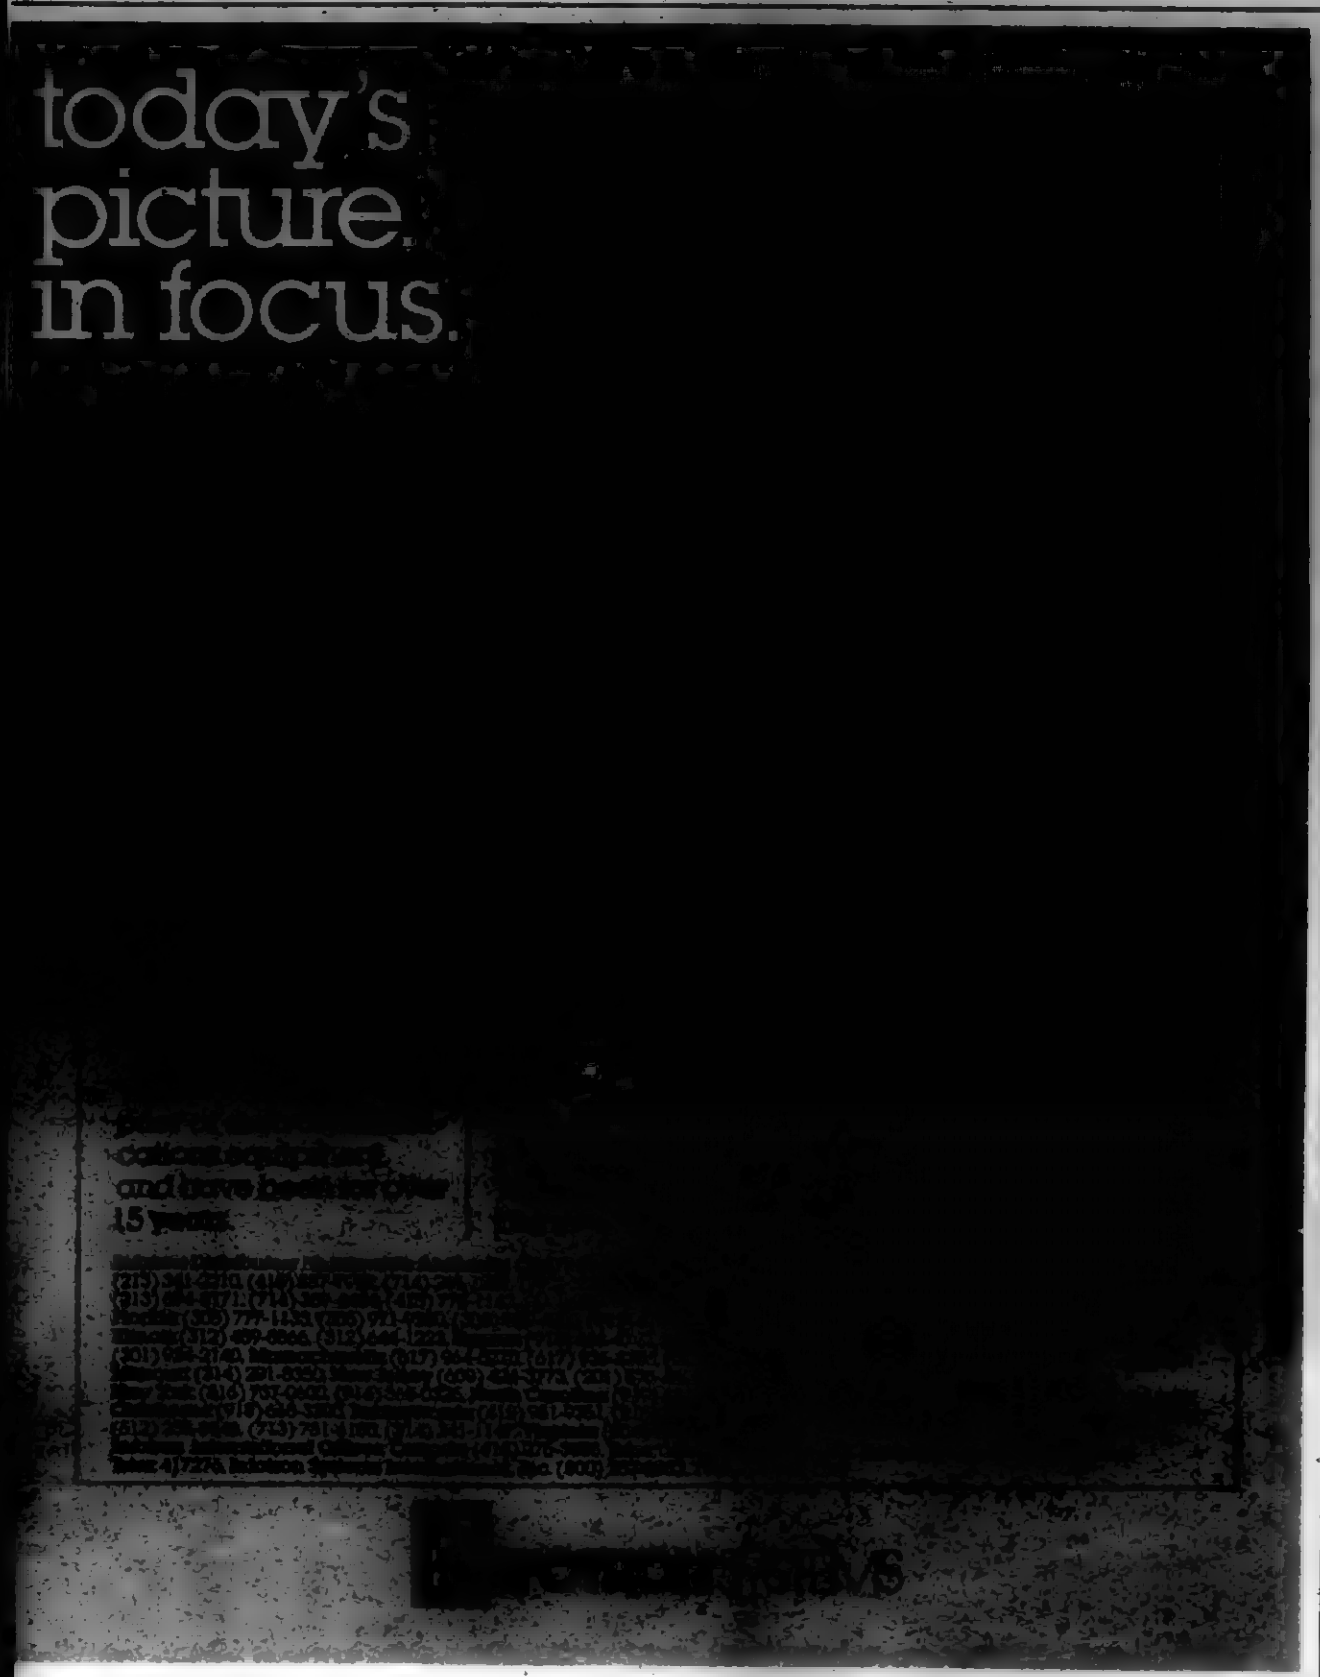
Education and training will become critically important as users start exploring the uncharted territory of the corporate data base, according to Thomas O'Flaherty, a principal consultant at Input, Inc. in Saddle Brook, N.J. "Users now look at MIS [management information systems] through a keyhole, knowing very little about what goes on inside," he said. "It's a heavy burden on MIS people to open that up."

O'Flaherty also believes mainframe software will begin to be modified to take advantage of the distributed processing power available on micros. "New technologies will make on-line capabilities on the mainframe less important," he said. "We'll see the industry evolve from batch to on-line back to batch again."

More friendly applications will proliferate on microcomputers, with windowing becoming a hot item, predicted Betty Feezor, product manager of the Personal Computer Products Division at Management Science America, Inc. Also, "from a corporate perspective, people will be looking for really superior service from vendors."

Security will become an issue, particularly as dial-up access becomes more popular among users, Feezor said. Another concern is that users will want to download tóo much data at first, highlighting the need for good training from DP.

Local-area networks could be rejuvenated by the micro-mainframe link, noted Robert Weiler, vice-president of marketing at McCormack & Dodge Corp. "One of the hotter areas will be networking personal computers to each other without going through the mainframe," he forecast.



American
Red Cross

We'll Help. Will You?

GET EVERYBODY ON BOARD.

Now there's a way to let everyone in your company chip in.

AT&T Information Systems, the company whose unparalleled communications heritage has been bringing people together for 100 years, now brings your office together. With state-of-the-art office automation that's designed to get your company moving ahead.

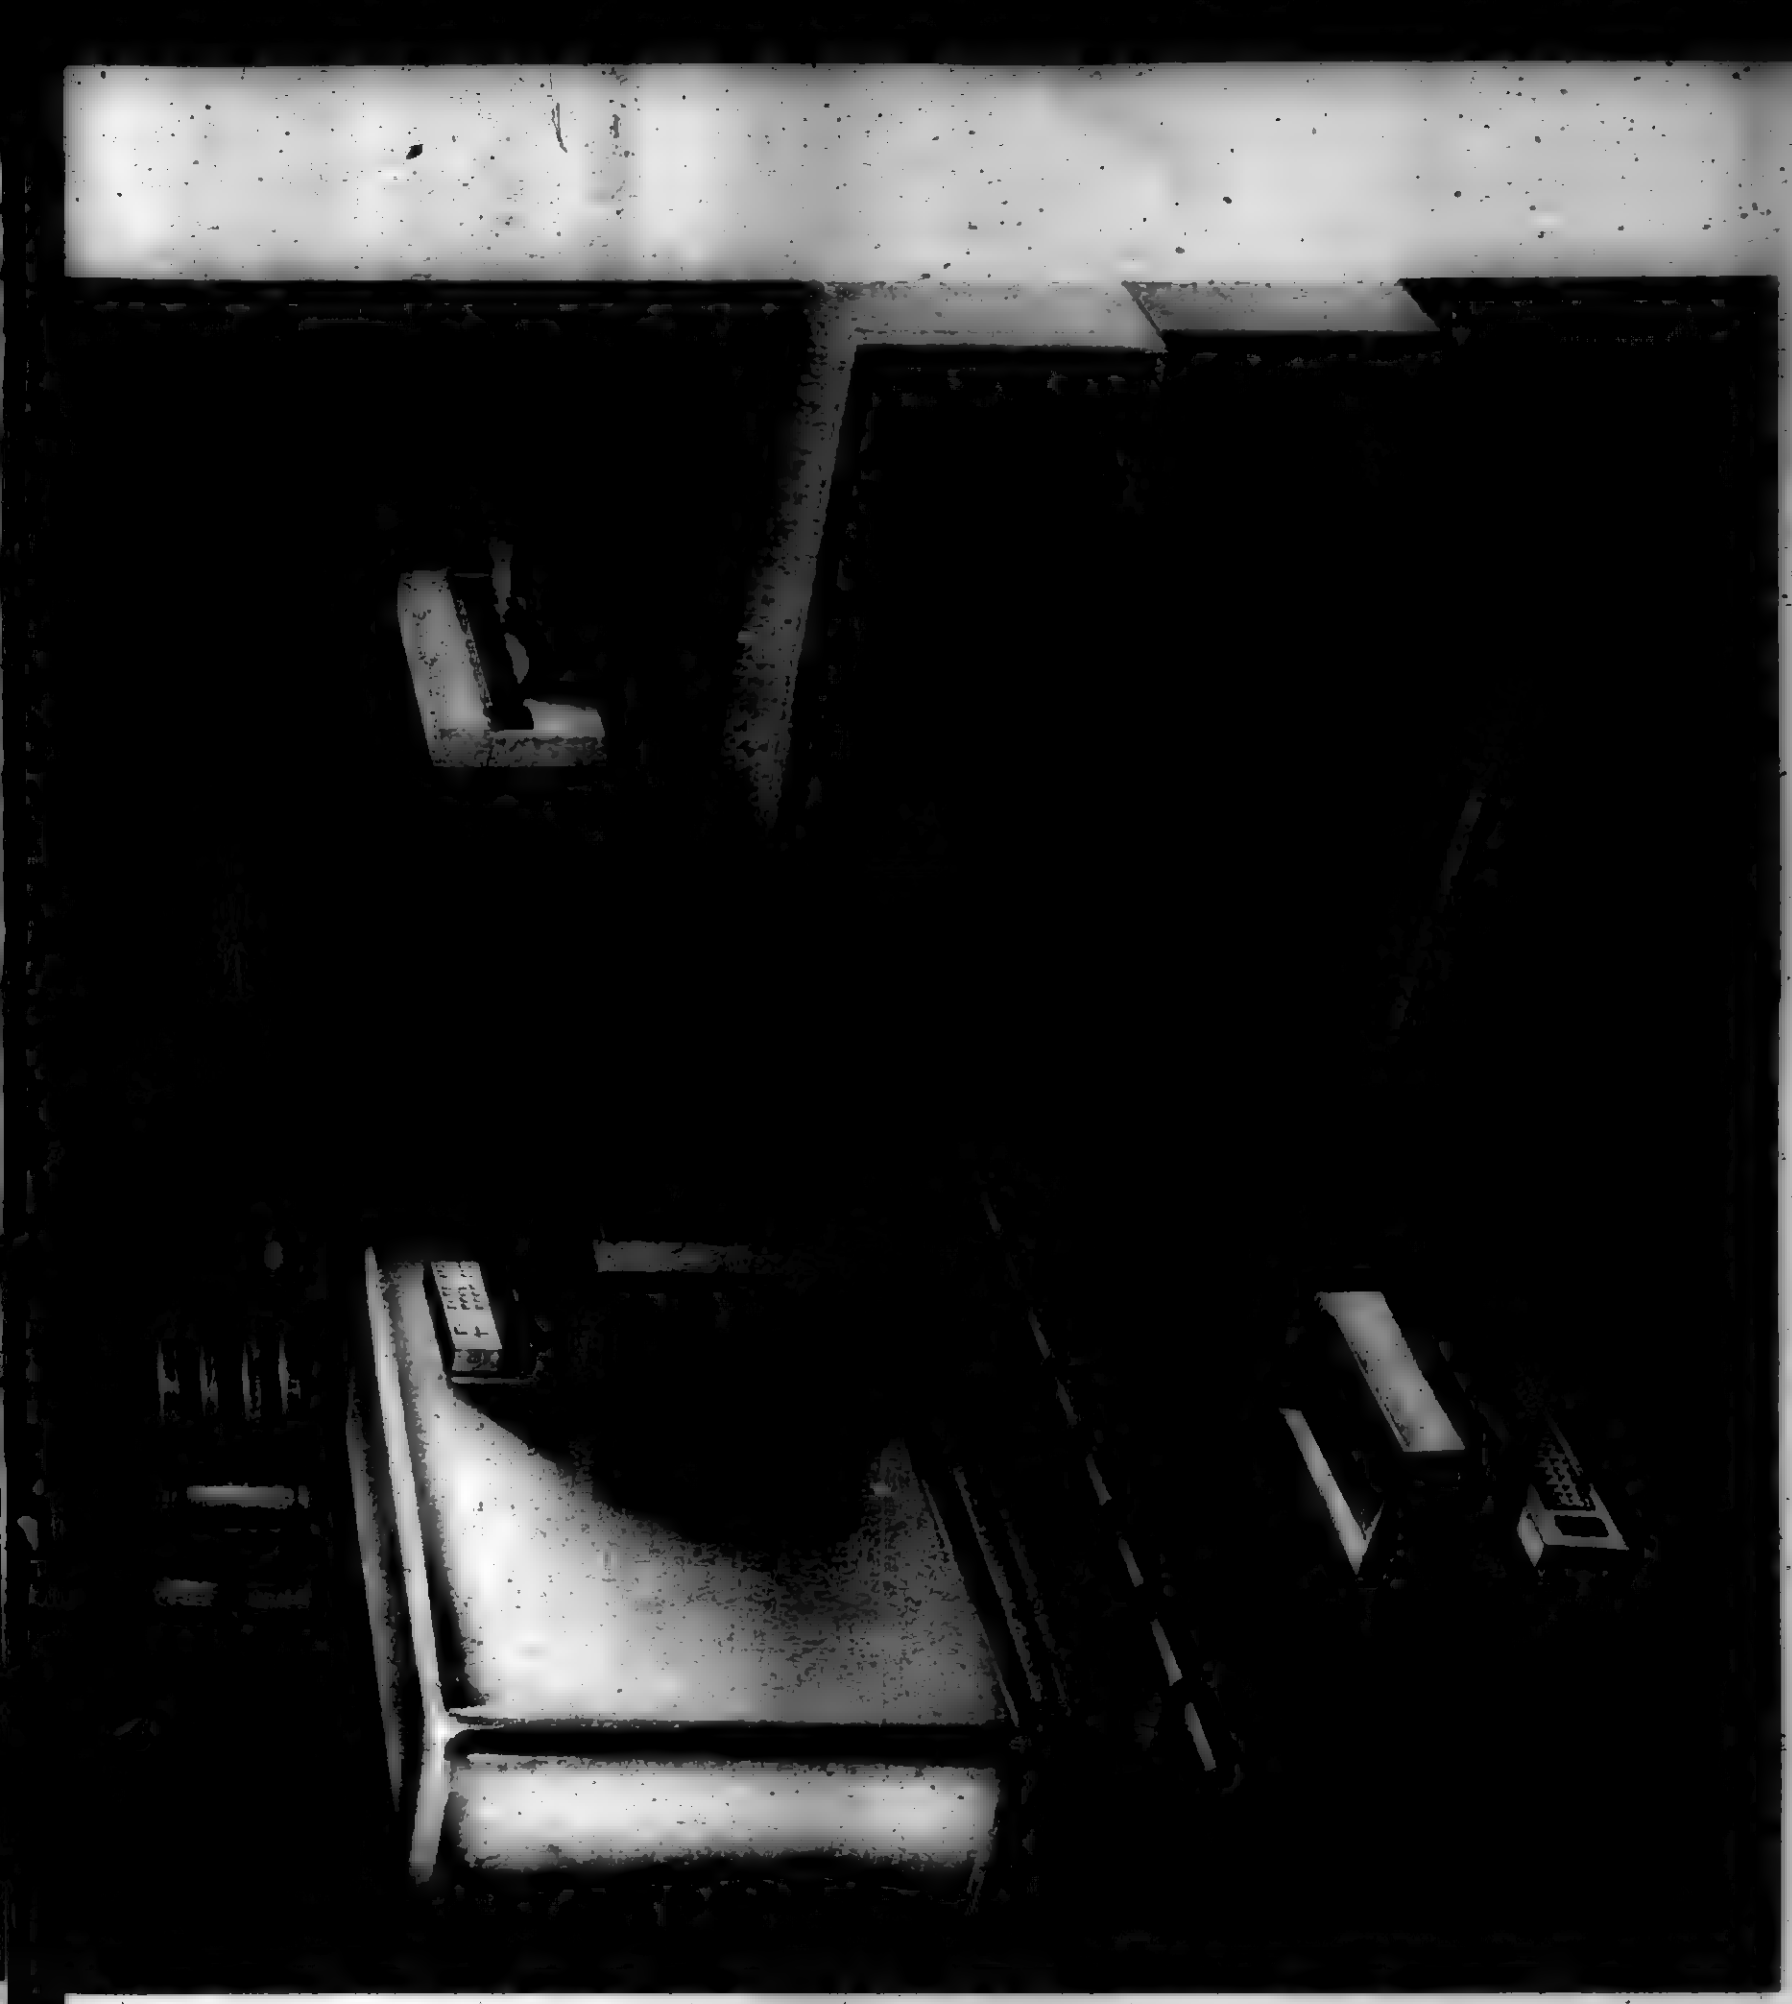
Electronic Document Communications, now available on System 85 and DIMENSION® PBX, is an easy-to-learn software application that's hard to beat. Because it integrates your office by letting everyone prepare, send and store documents and messages with the speed and efficiency of a computer. So you can have better access to the right information in the right form at the right time.

Electronic Document Communications can streamline your office in three ways:

Preparing Information—Reduces the time, effort, cost and wasted paper between drafts by electronically creating, editing and formatting documents and messages. "The Composer," a special software feature, checks spelling, grammar, punctuation and usage. EDC even measures whether documents are readable by technical and nontechnical readers.

Moving Information—Speeds documents to many people in different locations simultaneously so they can act decisively. EDC allows you to determine the timing and cost of delivery, and even check to find out when documents were received. Using a password ensures the privacy of your messages.

Managing and Storing Information—Locates documents, and retrieves and evalu-



ates contents quickly and easily with electronic files—while reducing the possibility of losing documents. An electronic "Mailbox" allows you to quickly determine which documents to read first. EDC reduces storing and filing costs with an electronic "Archives" that allows for either short- or long-term storage, and the "Wastebasket" which enables you to permanently delete items after a determined period of time. There's even an electronic "Calendar" that checks personal schedules and arranges mutually convenient meetings.

Not only will all these features help you further integrate your office, Electronic Document Communications is itself just one part of AT&T's line of completely integrated business systems. For state-of-the-art office automation, you can implement EDC in conjunction with other applications software like Message Center/Directory, a call coverage and message system. These office management applications are now available on System 85 and DIMENSION™ 600 and 2000 systems with the Applications Processor.

The result is you'll be able to improve staff productivity at every level and get everybody on board. And as new features are developed in the future, they'll be compatible with your existing equipment.

EDC was developed by Bell Labs systems designers who now work for AT&T Information Systems Laboratories. AT&T Western Electric produces EDC, and AT&T Information Systems will maintain it with comprehensive, conscientious service from the largest service organization in the industry. To find out more, call toll-free 1-800-247-1212, Ext. 879M.

AT&T's Electronic Document Communications: It's part of the integrated office of tomorrow that you can board today.

AT&T Information Systems

IBM

King of the Road

By Bill Laberis

Why, man, he doth bestride the narrow world like a colossus.

— Cassius in Shakespeare's *Julius Caesar*

A personal computer was absent from both the product agenda and the minds of most key strategists at IBM in 1980. But the following year brought a personal computer announcement; a few machines were shipped by year's end. In 1982, 100,000 personal computers bearing the ubiquitous blue initials left IBM's shipping dock; in 1983, 600,000 machines.

Bill Laberis is senior editor/industry at Computerworld.

In 1984, IBM will own a majority share of an exploding market where 36 months ago it had no product. To do so, IBM unflinchingly shattered a time-honored tradition in allowing outsiders to provide major components and software for its personal computer.

The action sent deep tremors rippling throughout the personal computer market, burying some of IBM's competitors and driving most of the rest to the relative safety of various market niches. But it soon became apparent that, in the personal computer market as throughout every sector of the computer industry, there is no safety.

IBM is leaving no stone unturned in its inexorable quest to control every area where it competes and, thus, control its destiny. Its quick work of the personal computer business yielded positive proof of both its intent and its ability to do so.

What is truly mind-boggling is the magnitude of IBM's mastery over the most vibrant and strategically pivotal sector of the world economy. To put the company's No. 1 position in proper perspective, consider that IBM will earn more profit in 1983 — about $5 billion — than its closest U.S. competitor will realize in *total sales*.

IBM's maintenance revenues alone will be more than double the total sales of Digital Equipment Corp., which bills itself as the No. 2 computer company. In fact, IBM's revenues from a product it introduced just two years ago, the Personal Computer, are likely to exceed the total sales of its nearest competitor in 1984.

IBM Dominance

In short, no industrial company in history has approached the sheer dominance IBM has established over the markets in which it competes. No other company has wielded the power of IBM to legitimate such a broad range of products, methodologies and business practices. And few, if any, large companies have demonstrated IBM's uncanny ability to move so nimbly and quickly, completely revamping its organizational structure, manufacturing strategy and product mix, all since 1981.

"IBM will continue to play the wind in every arena of the market," said Michael Geran, IBM analyst with E.F. Hutton Corp. in New York. "They call the tune, and everyone else dances."

If it can be said that a mean and lean IBM put on the gloves in 1982, it follows that the company bloodied many noses in 1983 and will likely score major knockouts in the coming year. Companies that carefully chose markets where IBM maintained a low profile will find themselves fighting off Big Blue in their own backyards.

For example, with its 4300 series Glendale machines announced in September [CW, Sept. 19, 1983], IBM is targeting the scientific and engineering applications that heretofore had consumed so many high-end DEC and Data General Corp. superminis. According to Carl Amdahl, vice-chairman of Trilogy Ltd., "IBM is now able to provide a very cost-effective, high-performance machine that competes with off-the-shelf technology solutions found in today's superminis."

To complement this drive into the noncommercial market, IBM showed surprising versatility in announcing a significant OEM pact with Computervision Corp., the only company with greater computer-aided design and manufacturing revenues than IBM [CW, Aug. 15, 1983].

Equity Interest

Realizing it can't do it all alone, IBM is using others to spearhead thrusts into promising markets. It will use its equity interest (17%) in Rolm Corp. to ensure that it has an IBM-friendly private branch exchange to bring to the automated office. Its equity interest in Intel Corp., which has virtually paid for itself in terms of Intel's stock appreciation, ensures IBM a steady supply of Intel's coveted microprocessors. And an IBMer on the boards of both Rolm and Intel will ensure that at least a portion of the companies' development efforts will have a distinctive IBM flavor.

After several years as the defendant in a fruitless antitrust suit brought by the U.S. Justice Department, IBM has taken the offensive in the legal arena. Japan, Inc. will reel for some time to come following the punishment meted out to Hitachi Ltd. for its part in stealing IBM trade secrets.

Mitsubishi Electric Ltd. pleaded no contest in U.S. District Court to settle an industrial espionage case involving IBM software secrets. After being fined a paltry $10,000, Mitsubishi revealed the real damage suffered: It announced it would delay its re-entry into the Japanese IBM plug-compatible market for a "few" years.

And IBM has warned its biggest competitor in Japan, Fujitsu Ltd., about possible copyright infringement, reportedly buying and analyzing a Fujitsu mainframe to carefully scrutinize the machine for copyright violations.

"It's getting to be a mean, ugly world out there, and it doesn't look like it's going to be quite so much fun anymore," according to William F. Zachmann, vice-president of International Data Corp. in Framingham, Mass. "The junkyard dog is on the loose."

IBM

IBM Plug-Compatible Mainframers Fading

They were the "Great White Hope" of the computer industry just a few years ago, carrying to users a promise of liberation from the company that held the keys to the 370 instruction set.

Buoyed by favorable user opinion and led by a cadre of former IBMers, IBM plug-compatible mainframe (PCM) and peripherals makers successfully chewed into IBM's market share on several fronts. Often they did so by offering superior technology at attractive prices.

Tracking the fortunes of the PCMs today is a fairly easy task, mainly because there are so few that are viable, at least without support from various Japanese partners.

Magnuson Computer Systems, Inc. is mired in Chapter 11 proceedings, having been all but buried by IBM's 4300 series. Cambex Corp. ended fiscal 1983 losing nearly $2 million on ever-shrinking sales. Storage Technology Corp. (STC) has laid off scores of workers to counter weighty quarterly losses and is a full 18 months behind IBM in getting its 3380-type disk drive to market. Memorex Corp. has turned to making Burroughs Corp.-compatible disk drives to cover for sagging IBM-compatible sales. National Advanced Systems, Inc. has gotten out of domestic manufacture of IBM-compatible mainframes altogether. Upstart IPL, Inc. has suffered three consecutive quarterly losses, with no particularly bright prospects in sight.

"IBM will no longer concede anything to the PCMs," said Charles Greco, market analyst with International Data Corp. in Framingham, Mass. "I'm not saying it's IBM's intent to bury every PCM. On the other hand, it won't bother them much if they do."

Only Amdahl Corp., which weathered a very poor year in 1982, has enjoyed any measure of success selling into the IBM world. But there are questions about Amdahl's ability to deliver Extended Architecture capabilities as planned — and about the long-term future of a company that is largely single-product in nature.

Even the Japanese PCMs are feeling IBM's ire, and in very costly ways, as IBM has aggressively and successfully pursued legal paths to prevent the Japanese from freely duplicating its operating software and modifying it for Far Eastern applications, as the Japanese had done for years.

No Concessions

"IBM will no longer concede anything to the PCMs," said Charles Greco, market analyst with International Data Corp. (IDC) in Framingham, Mass. "I'm not saying it's IBM's intent to bury every PCM. On the other hand, it won't bother them much if they do."

IBM is "behaving like they want 100% of every market they compete in," agreed Jack Hart, IBM analyst at IDC. "And instead of worrying about who's going to sue them, they're out suing the competition, like National Advanced Systems, over secrets theft. Things have changed."

In brief, IBM has gained a tremendous competitive advantage in recent years with a massive capital investment program that has made the company the quintessential low-cost, high-volume producer. Its participation in virtually every segment of the computer industry has enabled IBM to spread ever-increasing research and development costs across several product lines, lowering per-unit costs.

The PCMs — mainly single-product-line companies — cannot afford the initial capital expense needed to compete with IBM's production capabilities and don't have a range of products across which to distribute research and development costs.

In addition, IBM, with its early product support approach, has managed to withhold product specifications from its PCM competitors until it is nearly in the volume-shipment mode. This, coupled with changes IBM routinely makes during a product's life cycle, has

We carry Belden®...the most comprehensive line of computer cable available.

If you want to move data a few feet or a few miles, we can help you get clean, clear signals regardless of how difficult the operating environment. We have cable for local area networks plus plant and office interconnect applications. We also stock Belden's Bit-Driver™ line drivers and multiplexers for replacing short-haul phone lines with long-term savings. Plus, RG-62 coax, twin-ax from 78 to 200 ohms, Datalene,™ and individually shielded pair cables. Ask for them in Belden's time-saving, convenient, pull-dispensing UNREEL® packages. Many are also in stock for direct air plenum installations. Plus, we carry fiber optic cable for total interference immunity. You won't find a more complete line anywhere to cover your needs.

IBM

As 'Great White Hope' of the DP Industry

put the PCMs on the losing end of a vicious cycle where:

- IBM announces and ships a product.
- The company gets a one-year-plus shipment jump on the PCMs.
- The PCMs announce their plug-compatible versions and initiate shipments, struggling to meet stated performance benchmarks within compressed development times.
- Responding to PCM me-too announcements, IBM slashes the price of its product, at this point having recovered most or all of its initial capital investment.
- The PCMs must follow suit, biting deeply into their profit margins.
- IBM announces the successor to its product, and the cycle starts anew.

"Clearly it is the IBM strategy to get out there in volume prior to the plug compatibles' ability to respond," said Carl Amdahl, vice-chairman of Trilogy Ltd., which hopes to leapfrog IBM technologically and ship a competitive high-end mainframe by 1985. "IBM has clearly come a long way regarding the way it will now compete with the PCMs."

Amdahl, who was Magnuson's technical chief during its brief heyday, said IBM is much more price-aggressive than it was a few years ago, giving customers significant price breaks when they purchase systems bundling IBM components exclusively.

IBM, Amdahl said, has also insulated itself from antitrust pressure by promoting itself as "the creator and defender of American high technology and the only company capable of defeating the Japanese in the high-tech wars." Finally, he said, IBM has now caught up with and surpassed the technical expertise of its PCM competitors and has greatly padded its technological hand by acquiring stakes in other leading-edge suppliers like Intel Corp. and Rolm Corp. Amdahl predicted more of the same in 1984.

Jesse Aweida, chairman of troubled STC, said IBM's newfound aggressiveness has impacted companies in areas where it is competing in earnest for the first time. "The PCMs are used to fighting IBM," Aweida said. "We're dealing largely with very sophisticated users at the high end, and they look for value. That's what keeps us alive."

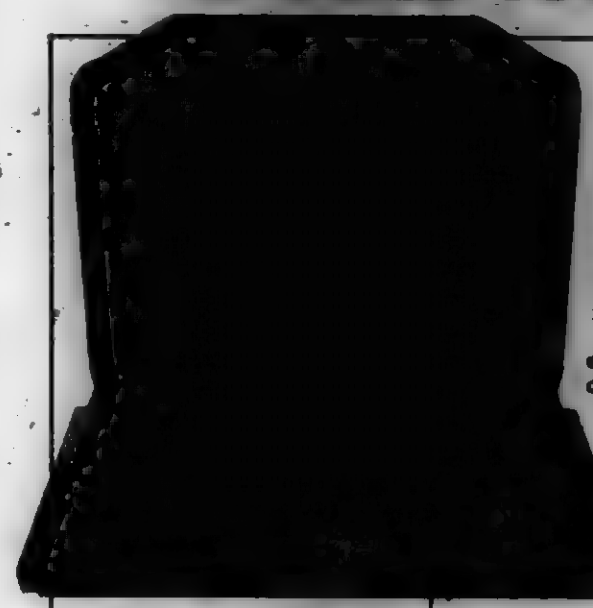
Aweida, whose company also is hoping to leapfrog IBM technologically with an optical disk storage system, said it is not feasible for PCMs to compete against IBM across a wide range of products in both marketing and manufacturing. However, STC is making an effort to crack the mid-range systems market, where, Aweida said, IBM has no competition.

"It has gotten tougher to compete [with IBM], mostly because they've become so price aggressive," Aweida said. "This trend will continue into next year and beyond, because they have great ambitions.

"But remember, users don't want to be confined to one supplier, especially when the PCMs can offer cost-effective alternatives," he added. "I wish people would stop writing about the PCMs like we're dead."

IDC's Greco sees the situation differently. "In the long run, only the Japanese will be able to compete effectively with IBM, and they might have to abandon the 370 architecture altogether to do it," he said. "The PCMs in 1984 will be more against the wall than ever. IBM's just too big and too good, that's all."

WITH RAMIS II ENGLISH, THE COMPUTER HAS FINALLY LEARNED YOUR LANGUAGE.



Now, you can talk to your computer the way you talk to a colleague: in plain English.

Even if you've never been on speaking terms with a computer, RAMIS II's advanced knowledge-based technology lets you ask questions, obtain answers, even create reports in only a few minutes. As a result, you can work more effectively and productively—without having to learn a specialized computer language. You just use English.

RAMIS II: ARTIFICIAL INTELLIGENCE THAT DELIVERS REAL PRODUCTIVITY.

RAMIS II English combines years of research by Mathematica in linguistics and artificial intelligence with proven expertise in developing practical, easy-to-use software products. The result is maximum fluency with minimum demands on support staff. In fact, while other systems require days or weeks of dictionary setup for each application, the *extensive built-in knowledge base* of RAMIS II English provides immediate access to most data.

RAMIS II English enables you to access data directly, without costly and time-consuming downloading or reformatting, so the latest information is always available.

Wherever your data is stored—in RAMIS II databases; in ADABAS, IMS, TOTAL, or IDMS databases; or in VSAM or sequential files—there's only one language you need to know: English. And, because English comprehension is an integral part of RAMIS II, you have full access to all of its fourth-generation capabilities, from powerful reporting and analysis to full color business graphics.

THE BENEFITS OF RAMIS II ENGLISH SPEAK FOR THEMSELVES.

Teaching the computer to speak your language is the best way to put the vast power of today's computer systems directly into the hands of *every* user from *every* department. RAMIS II English is one more powerful demonstration by Mathematica of the increased productivity available through RAMIS II—*the real* leader in complete software for business.

RAMIS II English makes it easy to understand why we're the real leader in complete software for business.

Let RAMIS II English speak for itself. See it in action at one of our regional Product Demonstration Centers. For more information, contact your local Mathematica office, call toll free (800) 257-5171, or return the coupon below.

IBM

What's Next in IBM's Product Strategy? Only

Second-guessing IBM's product and market strategies has become a tricky art in recent years.

Simply put, Big Blue has come to dominate so many sectors of the computer industry that its moves are dictated less by somewhat predictable external market forces and more by internal considerations of what is right for IBM. As one IBM watcher put it, "The worst thing for IBM's competitors is that IBM is no longer pressured into announcing anything. Almost without exception, the company does what it wants, when it wants, all in line with internal production schedules, capital requirements and the like.

"Guessing what they'll do is just that — guessing."

Nowhere was this independence more apparent in the past year than with IBM's November introduction of the PCjr, its low-end micro, which front-line analysts had picked for introduction at various times in March, mid-June, Sept. 15 and, finally, Nov. 1. IBM then defied virtually all predictions by announcing it would not actually sell the machine until well after the Christmas shopping rush.

Some Predictions

Notwithstanding a mind entirely its own, IBM is likely to make certain product and strategic announcements in concert with its stated intention to become a $100 billion company by 1990. What follows is a compendium of what IBM might have in store for 1984, based on interviews with several IBM watchers, including Jack Hart, long-time IBM employee and now an IBM analyst with International Data Corp. (IDC) in Framingham, Mass.; Charles Greco, who tracks IBM, and the lease market in particular, at IDC; Robert Fertig, president of Enterprise Information Systems in Greenwich, Conn.; and Robert Djurdjevic, editor of the Annex Computer Report.

Here are their predictions:

● *A 3080 Series Successor.* With the lofty code name "Sierra," IBM's 3080 replacement will be announced sometime in 1984, with analysts divided between a second- and fourth-quarter announcement. Initial shipments would begin six months after the announcement, volume shipments three to six months later.

The machine will offer sizable price/performance increases over the present high-end offerings, perhaps in the range of $200,000 per million instructions per second (Mips). Whether a clear migration path from the 3080 will be offered is questionable, with one source predicting an entirely new architecture followed by a "true" VM/XA announcement. A single processor in the 15- to 20-Mips range is expected, with 30-plus Mips in the dyadic mode.

IBM will likely delay the announcement as long as 3080 order backlogs remain healthy, which at present they are. The usual pre-announcement signals — price cuts in the 15% to 20% range for machines like the 3081 Model Group K and 3084 — will come two or three months before the Sierra announcement, perhaps on two separate occasions. Clearly, any gains in market share that IBM realizes with increased 3080 sales in anticipation of Sierra will come at the expense of Amdahl Corp.'s 5860 and the high-end machines of National Advanced Systems, Inc.

But if 3080 sales continue at present levels well into 1984, a Sierra announcement may not appear at all next year. As one analyst put it, "What's Sierra going to compete against? It will compete against IBM's 3080 series, that's what. They've got all the time in the world now."

● *More Storage Devices.* IBM's outrageously successful 3380 disk drive (more than 48,000 spindles shipped in 1983 with no viable competition) will be enhanced by a dual-density version offering about 1¼ times the storage at less than 1¼ times the price of the 3380. All signs point toward field upgradability of the 3380 to the dual-density model, while IBM will leave the door open to introducing a quad-density version, perhaps in 1985.

Analysts concede that IBM owns the mass storage market and that plug-compatible manufacturers such as Storage Technology Corp. (STC) and the Memorex Division of Burroughs Corp. are in for a rough ride in the disk drive arena in the coming years (see story on Page 34).

Analysts state with somewhat less conviction that IBM will also announce a successor to its 3420 tape drive, a replacement that has been rumored for a couple of years. IBM dropped the 3420's price 20% in August.

IBM

IBM Knows for Sure

Hunt Grace Perlis Djordjevic

But there are some compelling reasons for IBM's not announcing a new tape drive, despite the fact that it would allow the company to recoup some of the tape market share it has lost to STC. One reason is that STC will not announce a new tape drive until after IBM does, because the STC version must be IBM-compatible to sell at all. By not announcing a 3420 successor, IBM essentially will deprive STC of revenues it would realize from quick sales of a competitive product, which STC is rumored to have waiting in the wings.

Nonetheless, the consensus is that a 3420 successor will arrive in the second half of 1984, and it will be an 18-track, data streaming version.

● *On the Low End.* Louder rumblings of a 32-bit, multiuser system announcement have been heard, with some analysts speculating that IBM will make a concession to market pressure and announce full Unix support with the machine, called "Popcorn" at times. IBM is not now a dominant force in the low-end (20 terminals or less) multiuser market, accounting for only about one system in 10 shipped, compared with two of three mainframes. With few unplowed fields remaining, IBM may well announce significant products here in 1984.

● *Communications.* Seeking to attack its heretofore biggest customer, AT&T, before the communications giant can get its bearings in the competitive world, IBM will heighten its communications interests in 1984.

A local-area network is inevitable, not unlike the proposed baseband token ring net IBM unveiled in Geneva in October [CW, Oct. 31]. AT&T has local-area network plans, too, but is keeping them more tightly wrapped.

IBM's local-area network will run initially on twisted pair media at speeds starting at 4M bit/sec, while combining the serial local-area network principle of a ring net with elements of a star configuration.

In concert with the aforementioned upgraded mass storage devices, IBM may enhance its 3880 controller to handle the new load requirements, perhaps including tape controlling capabilities if a 3420 successor is announced.

● *Leasing.* The byword for 1984 is, "Look out, third-party dealers, here comes the IBM Credit Corp., full steam ahead." Analysts believe that with a third financing partner —General Mills Corp. — in tow, IBM will offer such attractive lease rates that it will capture any deal it wants, leaving the third-party dealers fighting harder than ever to write attractive leasing deals.

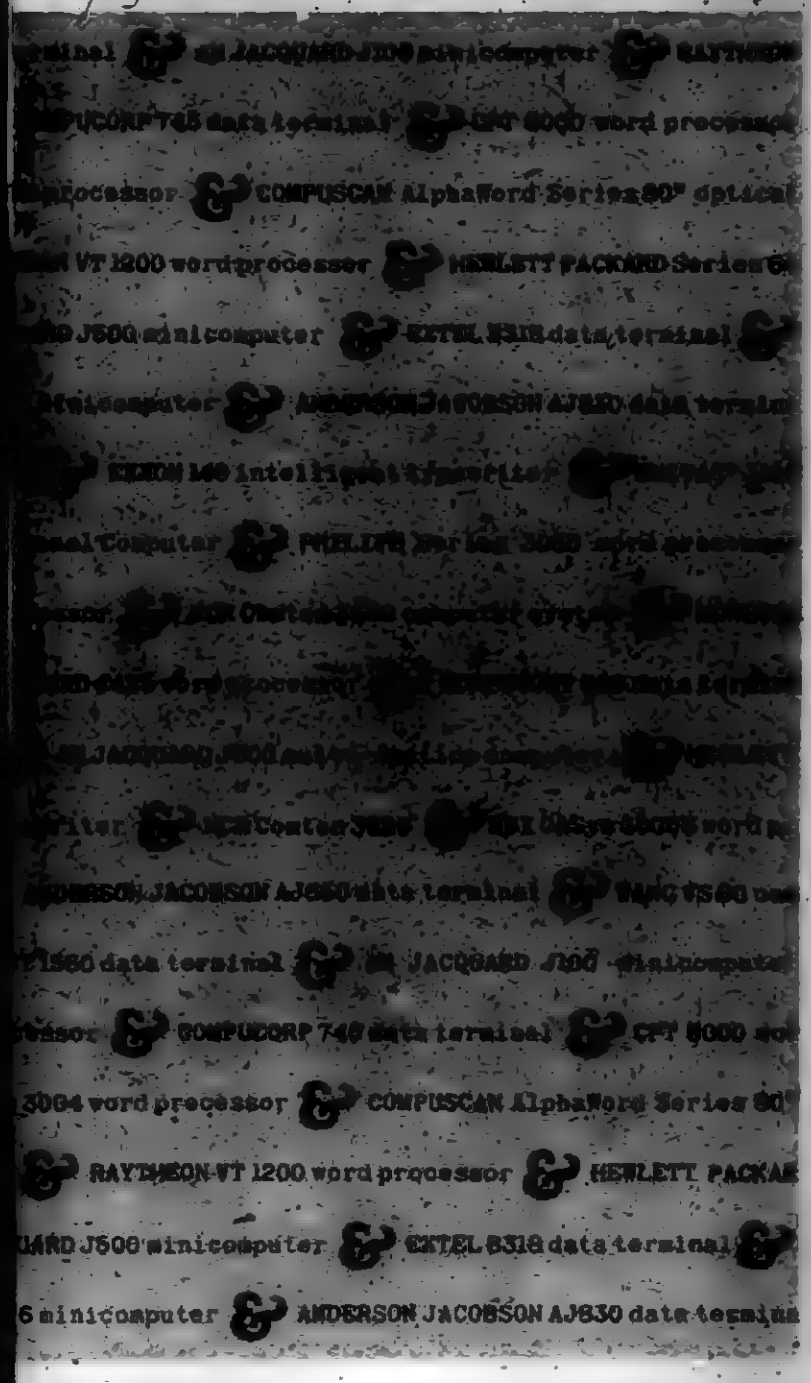
Next year, IBM Credit Corp. will "handsomely compensate" IBM's sales representatives who steer lease customers to IBM Credit Corp. and not to third-party dealers, one source said. IBM Credit Corp.'s lease volume will reach $1 billion next year, making it the largest lessor by far. The implications for users in 1984 are generally more favorable lease rates across the board, with third-party lessors at times taking greater risks than usual.

● *Business Strategy.* Growing from $40 billion in sales to $100 billion in seven years will be a Herculean task, even for a company 10 times larger than its nearest competitor. One growth path IBM will continue to follow will lead it to stake more minority equity positions in established companies, as it has done with Rolm Corp. (19% ownership) and Intel Corp. (17%).

Analysts polled settled on two broad areas in which IBM may be active in 1984 in minority stakes, robotics and software. However, none would speculate on particular partnership candidates.

Organizationally, IBM went from having seven to 18 independent business units in 1983, a trend likely to continue next year as the company continues to reap the rewards of carefully planned decentralization as it deepens its penetration across a broad range of market segments.

matchmaker.



A word processor and a computer aren't a match made in heaven.

Of course, neither are a telex machine and CRT. Or any of the machines listed here.

Rather, they're all matches made by us: ITT World Communications.

You see, until we came along, it wasn't very easy for businesses to send information from a word processor to a computer. Or from a telex to a CRT. Or vice versa.

Now all that (and more) is possible—by sending information through us.

Our network simply eliminates all the usual problems of unlike equipment.

So a company never has to be in the costly position of owning unneeded terminals, just to "talk" to other terminals.

Which means, you'll not only get the communications your company needs, but you could save money as well.

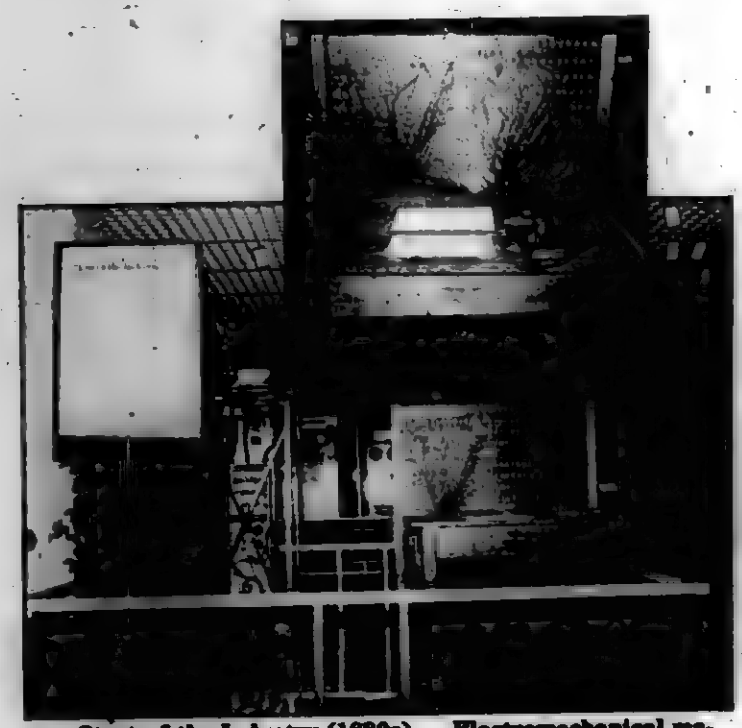
Advanced communications *and*-economy?

It sounds like a perfect match to us.

For more information contact your local ITT sales representative or write Marketing Dept. A/PR, ITT World Communications, 100 Plaza Drive, Secaucus, NJ 07096.

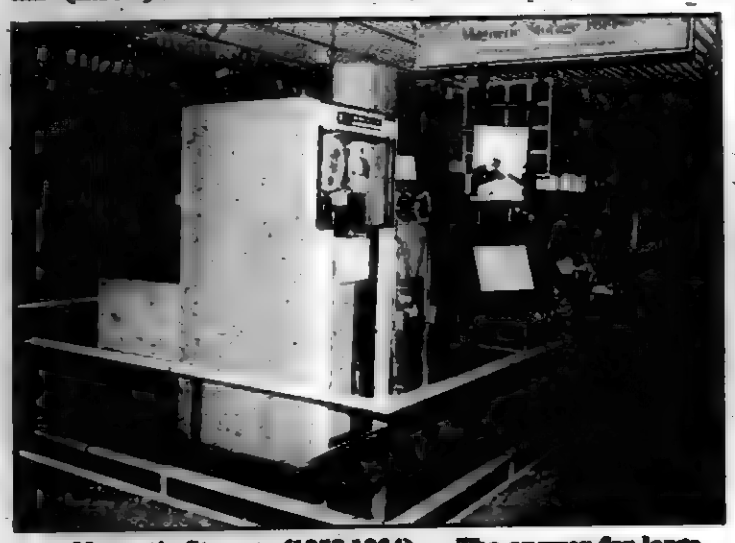
ITT

An IBM Look at the



1 Start of the Industry (1880s) — Electromechanical machines were the heart of info processing through 1940s. (Insert) Punch card machine by Herman Hollerith.

2 Wires, Wheels and Levers (1890-1946) — The beginning of modern data processing. (Inset) IBM 077, an early collator.



4 Magnetic Storage (1953-1964) — The answer for large-volume storage was the magnetic disk, enabling users to retrieve information directly, in less than a second.

5 Transistors (1957-1964) — Smaller, Faster, More Reliable. As a vacuum tube replacement, the transistor cut the time needed for electrical pulse circuits.

7 IBM 370 (1970s) — Faster Solutions to More Needs. The first computer with an entire main memory of monolithic technology.

8 IBM 3084 — Very High Densities (1980s) — More Speed, Function, Capacity, Reliability.

History of Computing

Photos by Lynn Haber
Text by David Myers

3 Vacuum Tubes (1946-1958) — The basis for the electronic computer, permitting calculations several thousand times faster than electromechanical relays.

6 IBM 360 (1964) — The First Big "Family" of Computers. This system incorporated new solid logic technology.

9 Today — Higher Productivity, Lower Cost.

The history of computing is in many ways the history of IBM. From the punched-card reader invented by Herman Hollerith for the census of 1890 to the newly unveiled PCjr home computer, IBM scientists and engineers have developed enough gadgetry for 10,000 patents.

A simple selection of these would make an impressive exhibit of computer technology — and that is what IBM created in a recent exhibit at its new Gallery of Science and Art on the ground floor of its world headquarters building in New York. (The IBM gallery, located at 590 Madison Ave., changes its exhibits regularly. The museum is open free to the public Tuesday through Friday from 11 a.m. to 6 p.m. and on Saturday from 10 a.m. to 5 p.m.)

Known to American business enthusiasts as the company of the Watsons, IBM might just as fairly be known as the company driven by hundreds upon hundreds of largely anonymous computer engineers. From modest beginnings as a maker of punched-card readers and time clocks, IBM became a computer vendor when the five-ton Harvard Mark I, a so-called Automatic Sequence Controlled Calculator, was installed at Harvard University in 1944.

Two years later, the first 100 production models of the company's 604, the first electronic calculator built around vacuum tubes instead of electromechanical relays, rolled off the lines in Endicott, N.Y.

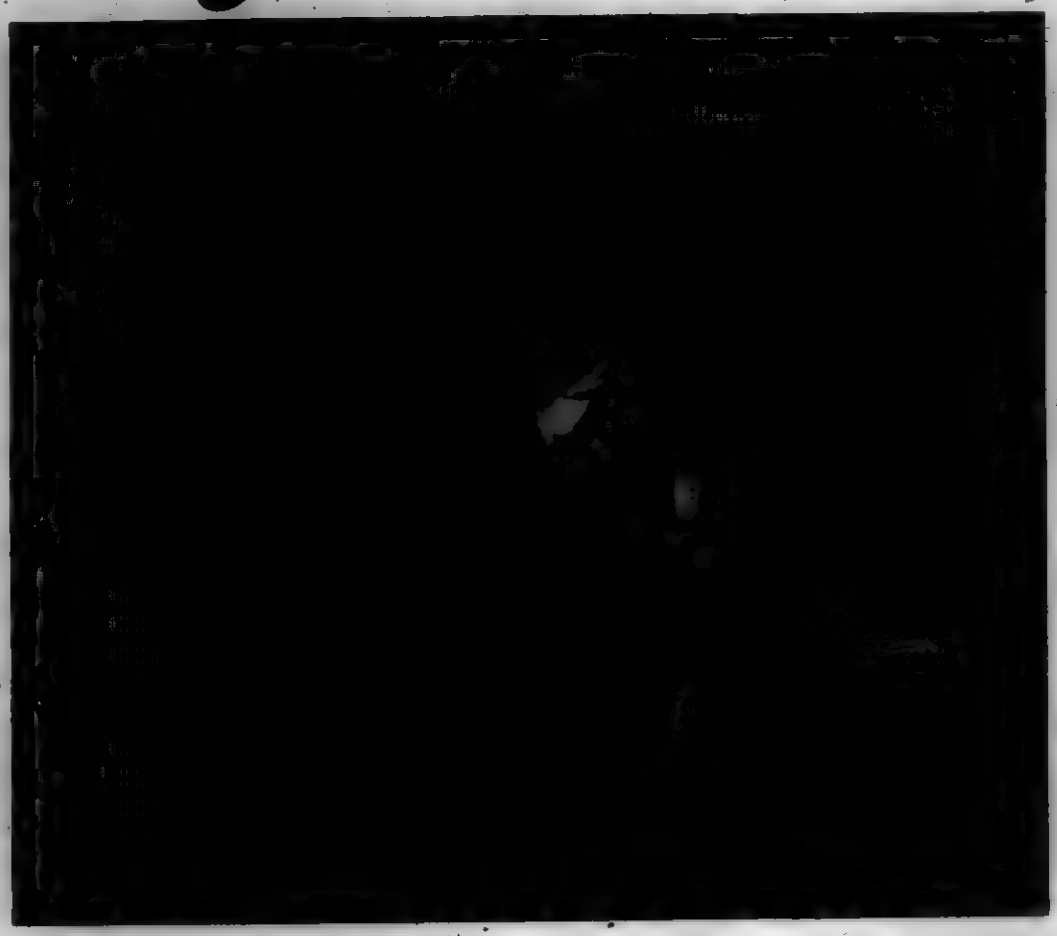
In 1948, when the firm installed the huge Selective Sequence Electronic Calculator in its headquarters on Madison Ave., IBM determined for years to come how the world would picture computers: room-size monstrosities of blinking lights — with 12,500 tubes and 21,400 relays — that dwarfed their operators.

Since then, computer technology has progressed from vacuum tubes to magnetic-core arrays, invented by An Wang and F.W. Viehe and first introduced into widespread use in the early 1960s. Soon after came the transistor, invented at Bell Laboratories in 1947 and used by IBM in 1961 in its Stretch, a computer 75 times faster than previous vacuum-tube models, built out of 150,000 transistors.

In 1964, only four years after IBM had launched captive production of transistors, came solid-logic technology, capable of switching a current from on to off in 30 billionths of a second. Integrated-circuit technology made its debut in 1971 in the 370 line of mainframes, the first all-integrated-circuit machines delivered by IBM. Not coincidentally, the 370 also capped an effort begun with the company's 360 series to make all its equipment compatible — yet another concept that IBM pioneered.

Lynn Haber is a Computerworld staff writer and David Myers is Computerworld's New York correspondent.

"IBM terminals n
says PCI.



Full capabilities, both worlds.

When your 3278 is in the ASCII mode, it can be a DEC VT-100 or TTY-compatible terminal. When your 3278 switches back to IBM, it regains its IBM screen capabilities, its 3278 identity. It's a split personality terminal, with the PCI 74D.

If you'd like to hear more about how to make your IBM world non-IBM compatible, get a dialog going with PCI today. To start your conversation, here's how to speak the language.

Your IBM CRT can communicate with ASCII hosts, like DEC, as if it was a DEC terminal. With a stroke of the key from your IBM CRT on your desk, you become instantly DEC-compatible. Your IBM terminal is now a DEC VT-100 CRT, thanks to the PCI 74D *de*converter from Protocol Computers, Inc.

You don't have to buy new terminals; you already own them.

Your IBM 3278 is a multi-function performer. Talk to DEC hosts, including those running the Unix and VAX/VMS operating systems. Talk to Dow Jones™ News/Retrieval Service for the latest stock information. Dial-up The Source. Connect to your Local Area Networks. The PCI 74D makes previously inaccessible time-sharing and private ASCII networks instantly available.

With the stroke of the key, you're back talking to IBM.

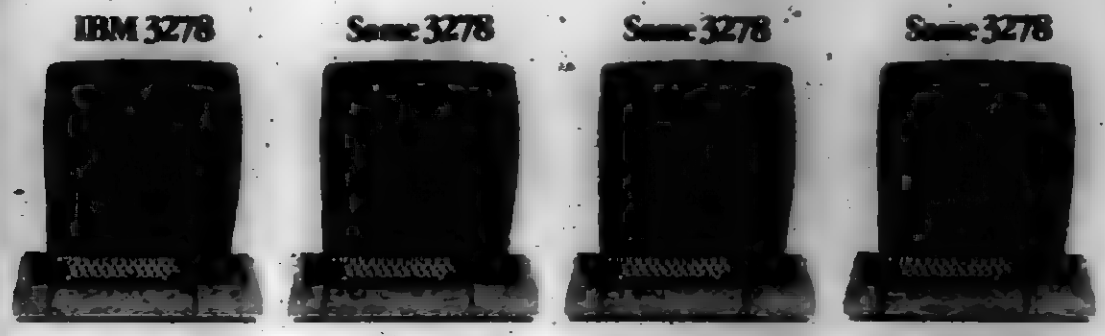
The PCI 74D switches your IBM 3278 terminal into the ASCII mode when it receives a specific keyboard command sequence. Suddenly the asynch ASCII world is at your fingertips. And just as easily, with another stroke of the key, you're back to IBM.

The PCI 74D resides between the IBM controllers (3274s and 3276s) and the hosts (IBM and ASCII). Connections to the controller or host can be either direct or through a modem. The PCI 74D is transparent to the IBM host.

Glossary:

ASCII (American Standard Code for Information Interchange). The language spoken by DEC, not by IBM (without PCI).
ASYNCHRONOUS Start-stop communications technique used by low-cost low speed ASCII terminals and Personal Computers.
CoaxFACE™ Exclusive PCI device provides RS232C interface to coax cables for attachment of ASCII terminals to PCI converters.
DEC Digital Equipment Corpora-

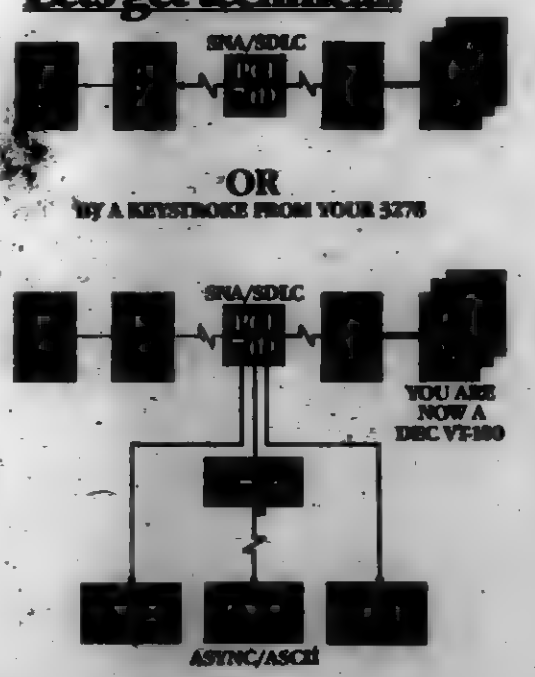
ow speak to DEC,"



tion. Used here as synonym for an ASCII host.
DECONVERTER (74D) Makes the IBM 3270 world ASCII-compatible.
FULL SCREEN The ability to modify an entire CRT screen of data without host interruption.
MODEMS Interface to allow digital devices to communicate over phone lines.
PaperCRT™ ASCII hard copy keyboard terminals have all the versatility of 3278 CRTs with this PCI option.
PCI (Protocol Computers, Inc.) We make the non-IBM world IBM compatible. Now we make the IBM world non-IBM compatible, too.
SDLC (Synchronous Data Link Control). Line protocol for data communications between IBM systems and terminals.
SNA (System Network Architecture). IBM's approach to data communications networking.
SNA/SDLC IBM communications; non-compatible with DEC (ASCII) communications (without PCI).
SYNCHRONOUS High speed, high cost data communications technique.
PCI 74D Deconverter makes the IBM 3270 world ASCII compatible.

3274/76 IBM controllers which support 3278s, 3287s in an SNA/SDLC network.
3278/79 IBM's CRT and color CRT.*
3178 IBM low cost CRT.*
3287 IBM's printer.*
*All non-compatible with DEC (ASCII) without PCI.

Let's get technical.



For more information call today, (800) 423-5904, (213) 716-5500 in California. Or write PCI, 6150 Canoga Avenue, Woodland Hills, California 91367-3773

The Micro Mainframe Link is available from PCI:

PCI 1076: ASCII to SNA/SDLC 3270 emulation.
PCI 1051: ASCII to Sys 34/36/38 5251 emulation.
PCI 74D: Deconverter that makes IBM CRTs ASCII-compatible.
PCI 1067: SNA/SDLC to ASCII 3767 emulation. The NTO alternative.
PCI 71B/SNA: BSC 3271 to SNA/SDLC 3274 emulation.
PCI 75B/SNA: BSC 3275 to SNA/SDLC 3276 emulation.
PCI 1071: ASCII to BSC 3270 emulation.
PCI 3780/SNA: SNA/SDLC to BSC 3780 emulation.
Videotex 67: SNA/SDLC to Videotex protocol conversion.
PCI's X.25 Series: PCI 73SX and PCI R73SX, SNA/SDLC to X.25 protocol converters for host and terminal connections respectively; PCI 1076X, ASCII to 3270 SNA/SDLC through X.25 networks, PAD included.
PCI's Networkers: Keystroke for keystroke 5251/11 and 3278 keyboard compatible ASCII CRTs.
PCI's IBM-PC software packages: For 3270 and System 34/36/38 emulation.

DEC

Breaking The Fall

By Peter Bartolik

The arrows flew from all sides in 1983 while Digital Equipment Corp. circled the wagons and hunkered down in decidedly bad humor. During a year in which the company was expected by some to renew its vigor, key executives left, earnings dropped and upstart competitors brought out faster machines.

The company struck a defensive posture, maintaining that nothing was wrong. But despite its protestations, it's beginning to look like DEC may go back to the basics in 1984.

Many people believed that 1983 would be the watershed year during which DEC would hone neglected marketing skills and mount a full-fledged campaign on the potentially lucrative business and office automation markets. The year was a watershed one, but not for the anticipated reasons. DEC announced in late October that first-quarter earnings would be off sharply — following a 32% slide in fiscal 1983 — because of "administrative problems" in shipping microcomputers and delays in shipping computer disk drives for large machines. Following the bad news, the stock market chopped more than $30 off the per-share price of DEC stock before it began to edge slowly back up past the $70 level.

Financial analysts, many of whom had begun to back away from the stock, sounded betrayed, in light of DEC's previous forecasts, and quickly revised downward their estimates for the company's health in 1984. Stephen K. Smith, an analyst with Paine Webber Mitchell Hutchins and still a DEC booster, lowered his fiscal year 1984 earnings projection to between $3 and $4 per share, which would be the lowest level in many a year.

The finger pointing was fast and furious; some said the company was befuddled by the aggressive moves of IBM, others said that the company lacked solid marketing skills. Some even insinuated that the company's management was past its prime.

No Charlie Chaplin

Talking to DEC President Kenneth H. Olsen, who has no intention of appointing a successor, one would think that 1983's problems were merely a bump in the road, an inconvenience that was overplayed by the nervous Nellies on Wall Street and the bloodthirsty hounds of the press. "You see, people who make these comments don't understand what marketing is," Olsen said in a recent interview with *Computerworld*. "They expect marketing to be Charlie Chaplin on television. [But] marketing is identifying your product and identifying your customer and bringing the

Peter Bartolik is a staff writer at Computerworld.

DEC

two together, and with our kind of product, we're after commercial, industrial, scientific and educational markets.

"This [marketing] often is not completely noticeable by the ordinary people who aren't our customers. . . . We really haven't been too bad through the years, and people that consider us not a marketing company ought to look at the results; we're not doing too badly. I think that's the measure. The measure isn't whether your mother-in-law in Idaho recognizes the name of the company.

"So, yes, we plan to be aggressive, and yes, we should be more aggressive, but no, our goal isn't to be noticed by the financial people or the press."

But the people who make the decisions on buying business computers and word processing equipment may very well be the people whose eyes are riveted on the latest TV antics of IBM's Charlie Chaplin look-alike. And the question has been asked whether a company that touts its highly technical spec sheets can sell in the burgeoning office automation market.

Frederick G. Withington, an industry analyst with Arthur D. Little, Inc., believes that in 1984 we will see "a considerable amount of refocusing" from DEC. "They'll be going back to their basic market." He quickly added, however, "that [it] doesn't mean they're giving up on office automation or the personal computer, it just means they realize there is more potential in their traditional scientific and engineering market."

Olsen claims that in the recent past the company has not lost an office automation contract in bids against the industry leader, Wang Laboratories, Inc., and that DEC probably has more word processing workstations installed than anybody else. But much of that installed base is in the markets of science and engineering where DEC has traditionally dominated.

"When it comes to the white-collar office, we didn't concentrate on that 'til the last couple of years, but we haven't lost an order to the leader in that business, [not] a single new order for a couple of years," Olsen said. "People already using somebody else's equipment have a tendency to continue to do so, but for new orders we don't lose."

Aaron Goldberg, an industry analyst with International Data Corp., doesn't feel DEC is ready to give up on the white-collar market. However, he concluded, "The move into the commercial markets is taking DEC a lot longer than it anticipated."

Won't Overrun IBM

In the area of microcomputers, DEC is going to bide its time and wait for the market to rise to the company's level, according to Olsen. With the announcement late last year of the Microvax I, a VAX-11 superminicomputer on two micro boards, and the expected announcement later this year of the "VAX-on-a-chip," the company is developing sophisticated equipment for the sophisticated user who grows dissatisfied with the limits of lower end microcomputers.

"We're not going to overrun IBM [in the micro area]; we're not going to compete head-on with IBM," Olsen declared. "Our equipment didn't set out to get that broad market base, and so we're not going to go after that broad market they are. We're going after that segment which maybe learned about computers with the less expensive, more computer-oriented machines [and now wants more power]."

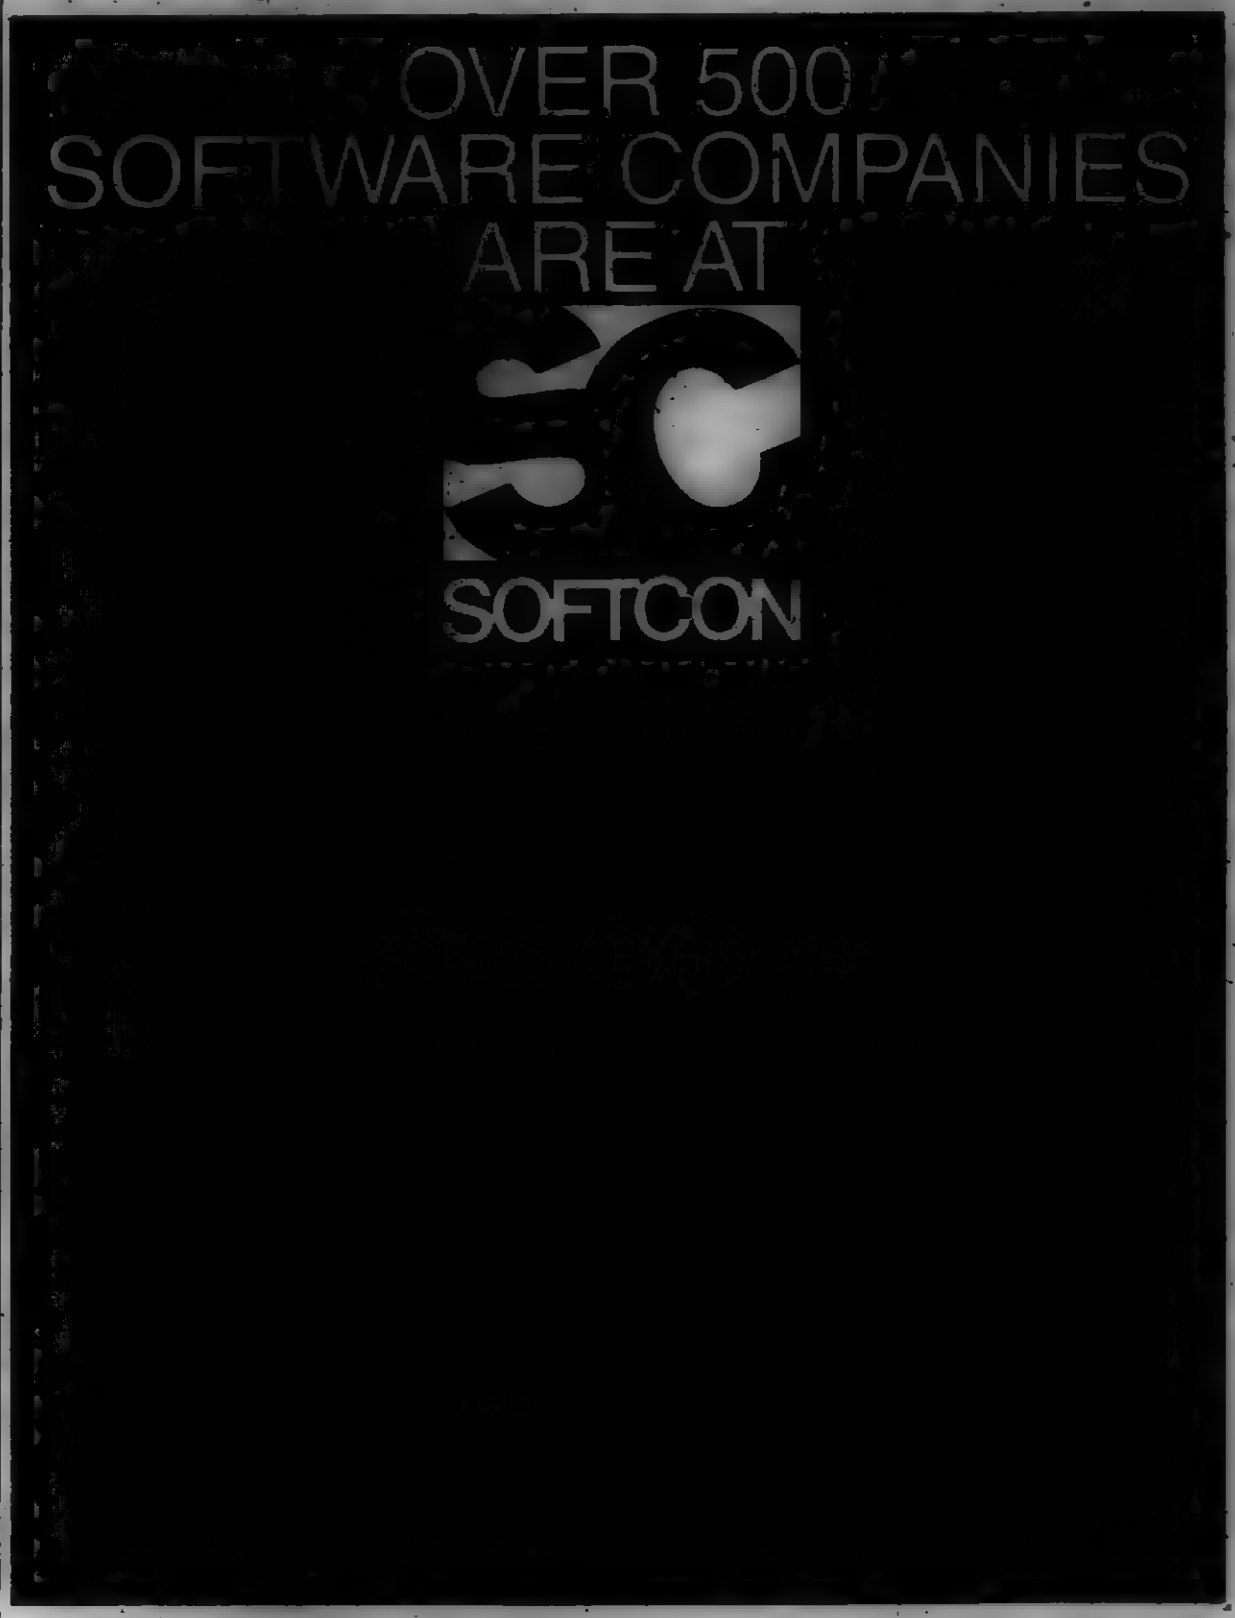
But if DEC won't compete with IBM in the micro arena, that's not going to stop Big Blue from trying to claim a piece of the traditional DEC market. Olsen said he welcomes the challenge and is "flattered" by IBM's interest, but believes DEC offers unique services.

However, IBM's move into DEC territory has "already happened," according to Withington, who said that DEC is not fully prepared to wage war with IBM. "DEC needs better technology. [Its] electronics are not as modern as IBM's."

On the other hand, DEC is not entirely defenseless, Withington acknowledged. "In the eyes of a considerable number of users, DEC has superior software, better cost packages and ease of use, and perhaps the company is more responsive. And its greatest asset is the number of people who have written software for the VAX."

IDC's Goldberg also believes DEC is well-equipped to maintain its market, but he expressed concern about the "exodus" of top and mid-

(Continued on Page 48)



(Continued from Page 41)

die management personnel, particularly from "projects" under way at the company. Most notable of the departures was the mid-summer resignation of C. Gordon Bell, formerly vice-president of engineering [CW, July 25].

Olsen practically bristles when he thinks of the published comments of unidentified former employees. "When the senior people left the company, I don't think any of them ever said bad things to the press. But some of the people who lost out at the more junior level don't know enough to keep their mouths shut, and the press often doesn't know enough. . . . you [shouldn't] talk to people who either left angry or who didn't make it here, who failed here or were let go or . . . the press should be more sensitive."

If the company has more leaders than it can use, he added, that is a positive sign that shows DEC is doing well; some personnel, he added, were with the company for a long time and simply wanted a different type of position or change of pace.

The 'Late' VAX

Another topic that ruffles Olsen's feathers is the suggestion that the high-end replacement for the six-year-old VAX-11/780 is late in coming. "The VAX computer is a very sophisticated computer. Because of all the features and details, it is very difficult to make it very fast, so from the start there have always been people who make simpler, faster machines. . . . We don't compete on speed, we compete on throughput and convenience [and] ease of use and those features."

Olsen claims that the products "we've got coming" make his job the most exciting that it has ever been. But the industry experts aren't so sure.

An Almost Mythical Giant

MAYNARD, Mass. — Within the organization, Digital Equipment Corp. President Kenneth H. Olsen looms larger than life, an awe-inspiring mythical giant standing with one foot forward, gazing over the horizon. It's an image with which Olsen is apparently not uncomfortable.

During a recent interview with *Computerworld*, Olsen made it clear that DEC is his company, and in no way is he ready to turn the helm over to someone younger.

Asked if he had a team ready to take over when the time comes to go out fishing, Olsen replied: "Oh no, you never have a team ready, and I'm still too young to say we'll set a team up. . . . We have a number of bright people, [but] I'll probably never admit that they're ready to take over without me."

Olsen at a Recent Meeting

On his actual role, Olsen said: "If anything, I fail at not being the forceful decision maker. . . . Where we've been successful, we've broken down the pieces where people have responsibility, set the goals and measured them. . . . Basically, strategy is encouraged by me or teased by me, but it's the responsibility of individuals."

"And so far as making the decisions, I take an active part in teasing, showing, educating, but . . . the decisions come automatically . . . it's making sure decisions get made, that's the job."

Departed Personnel

On departed personnel: "The people who have left us left for all kinds of reasons, and we would never make any comments about why. We would never say how many left because we encouraged them or how many left because . . . and most of them know enough to keep their mouths shut, too."

"Maybe the way to say it is, as friends and as colleagues for a long period of time, we miss them; but as part of the organization, it gives the opportunity for the bright, young people to move in and take these jobs."

On IBM's aggressive product strategy: "We have a head start there. We have the software, we have the machines, we have the products coming, so we feel flattered to have them show this interest."

(Asked if it isn't a problem to deal with the mystique behind the IBM name, Olsen replied, "Oh yeah, but it's a big market. We do those areas we feel we can offer something unique in.")

On the challenges of younger superminicomputer manufacturers: "When people say there's three or four machines out there faster, our answer is there always have been, so [speed] is not what made [the VAX-11] the standard of the industry. It's fast, but there is always something that goes a little faster. So we won't admit that we've lost any of that market; we've always had competition there and probably will for a long time. We don't offer the fastest, simplest machine."

Trauma With Micros

On the trauma in the micro market: "The trauma which we went through bears no relationship to the trauma that others went through. We made some administrative mistakes, we call them administrative, and that really had little to do with our personal computer plans."

"Our first year, we probably shipped more than IBM did its first year. We shipped approximately what we had planned. There were different types of plans, different types of numbers, so that statement is not always consistent; you see. And we accomplished very much what our original plans were, although at times we had more ambitious plans.

"But the problem of most personal computers, I would assume, is that most of them are in the same market; they do the same thing. We, from the start, have been after a different market and a different level of quality. . . . So we feel our approach just takes a little longer to catch on."

MicroAge

"THEIR ENTHUSIASM ABOUT OUR GROWTH IN ALASKA WAS CONTAGIOUS...IN LESS THAN TWO YEARS WE'VE EXPANDED INTO FOUR COMPUTER STORES!"

"MicroAge's enthusiasm was catching! The same can do energy that started MicroAge during the pioneering days of microcomputing is now a matter of company policy."

"Plus, MicroAge helped us get key product lines for Alaska!"

"We're believers in MicroAge. Their industry knowledge and insight into recent product developments has given us the flexibility to think and react before our competition does. We started with 4 people in a single store in 1981...now we have 4 stores and 26 people."

"At MicroAge, they speak our language...success!"

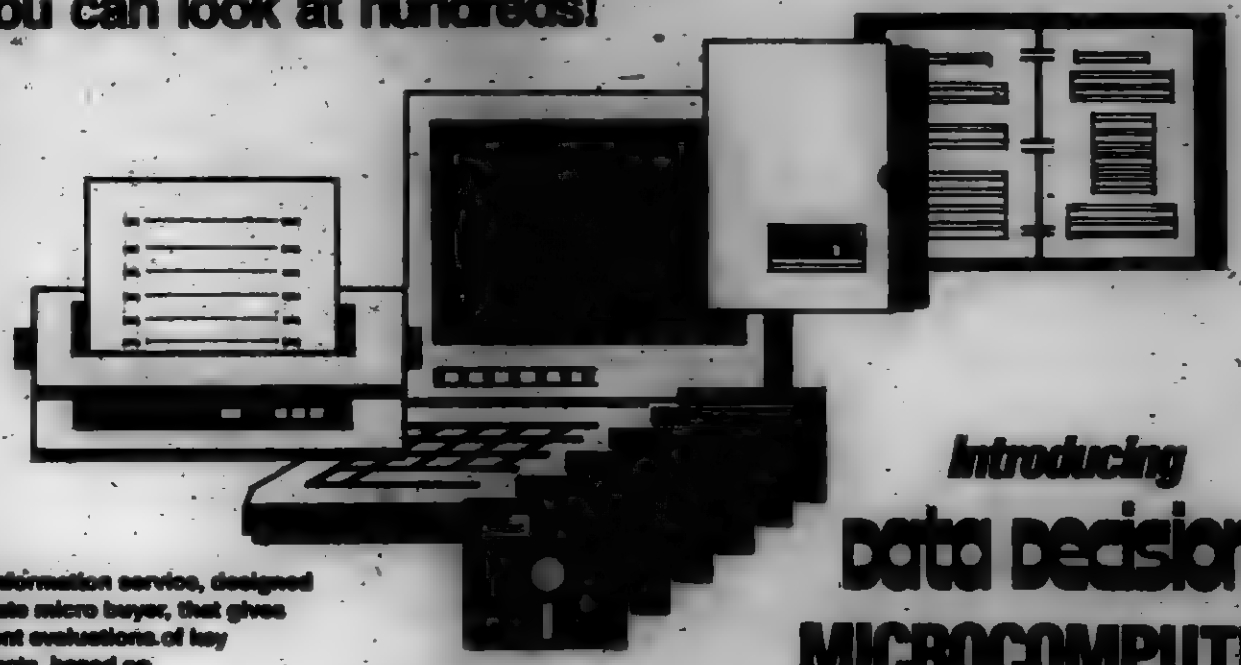
How many micro software products do you have the time and money to test before you buy?

Now you can look at hundreds!



Introducing

Data Decisions™ MICROCOMPUTERS

An ALL-NEW information service, designed for the corporate micro buyer, that gives you independent evaluations of key software products based on

Hands-On Testing By Microcomputer Experts In Data Decisions' Own Labs

That's right. You'll find hard-hitting analyses based on the actual experience of seasoned experts who used the products under controlled conditions designed to simulate the situations you'll find when you bring these products in-house. Equally important—these experts base their evaluations on *fine-tuned, consistent criteria* so you'll know that similar products are all judged by the same standards.

In addition to this EXCLUSIVE FEATURE—available ONLY in Data Decisions MICROCOMPUTERS—you'll also find out:

Everything you need to know about MICROCOMPUTERS:

Desktops . . . high-level intelligent terminals marketed as independently programmable standalones . . . multi-user UNIX-type-based systems . . . executive workstation "professional" computers . . . integrated office automation workstations . . . supermicros . . . lineatops . . . portables/transportables . . . MORE

Everything you need to know about SOFTWARE:

Spreadsheets . . . graphics . . . financial packages . . . independent operating systems . . . DBMSs . . . office automation . . . communications . . . MORE

Everything you need to know about EXPARSION/ EXTENSION CARDS:

Controllers . . . clocks . . . A to D converters . . . extra quad boards . . . interface boards . . . language cards . . . solid state disks . . . memory boards . . . processor enhancements . . . auxiliary processors . . . MORE

Everything you need to know about COMMUNICATIONS:

Micro LAN networks . . . micro modems . . . micro terminals . . . terminal emulators . . . micro-to-mainframe downloaders . . . database access packages . . . electronic mail . . . MORE

Everything you need to know about PERIPHERALS, ACCESSORIES, SUPPORT EQUIPMENT:

Printers . . . plotters . . . monitors . . . floppies . . . hard disks . . . keyboards . . . tape drives . . . OCR, bar codes, sensors . . . power supplies . . . power surge protectors . . . cooling fans . . . MORE

In short, Data Decisions MICROCOMPUTERS gives you everything you need to:

- Eliminate time-consuming evaluations of inappropriate products.
- Reduce the number of sessions you have with vendors and distributors.
- Avoid costly product-selection mistakes.

And all this for no more than you would have to pay a consultant to do *one* of our hands-on software evaluations!

How is the Information in MICROCOMPUTERS Provided?

As a MICROCOMPUTERS subscriber you get:

Two loose-leaf volumes filled with the most complete, concise, accurate, easy-to-use and current information ever compiled on the micro marketplace. . . . And all this information is consistently formatted to make product comparisons easy and quickly guide you to the facts you need.

Incisive Product Analyses that *highlight* the specific strengths and limitations of mainstream hardware and software products and discuss their suitability for a corporate environment.

Action-Oriented Technology Reports, Market Studies, and Tutorials on topics like hard disk cassette drives, modems on a chip, color printers and networking pcb.

Reliable User Ratings that let you see how products measure up in the opinion of your peers.

Lively Monthly Newsletters that highlight late-breaking industry happenings, discuss new product announcements, and provide a calendar of events. The MICROCOMPUTERS Newsletter also contains 2 special features —"Magazine Roundup," which tells you the best articles published in the microcomputer trade press during the previous month, and "*This Month's Test Results*," a capsule version of the key findings of each hands-on analysis.

Unlimited Free Telephone Consulting by micro experts whose only job is to provide quick answers to your questions.

Thick Monthly Updates . . .
Comprehensive Surveys . . . User Names for major software products . . .
Complete Vendor Directory . . . MORE

About Data Decisions™

Data Decisions is a research organization that publishes information services on computer and communications hardware and software and provides custom consulting services on the computer and communications industries.

When Data Decisions was founded in 1960, it quickly attracted a unique group of information specialists and professionals who, individually and as a group, have played a major role in the development of the EDP information services industry as we know it today.

The staff of professionals at Data Decisions includes the largest, most experienced group of senior analyst-editors ever assembled to work on EDP information services. Data Decisions has *three times more people assigned to the evolution and maintenance of our flagship products than does our largest competitor.* At present we employ over 100 people, and our development efforts are carefully designed to assure our continuing pre-eminence in the coming years.

Can I Examine MICROCOMPUTERS for Myself?

YES! If you *act now*, you can receive a *no purchase obligation TRIAL REVIEW* of Data Decisions MICROCOMPUTERS and an *opportunity to subscribe* to MICROCOMPUTERS at a *special charter subscription bargain price* of only $625—that's $75 off the regular subscription fee of $700.

Even if you've already agreed to look at another micro information service, be sure to take advantage of this Data Decisions offer as well. YOU WON'T FIND HANDS-ON TESTING RESULTS ANYWHERE ELSE, and you have nothing to lose.

To request your trial review and become eligible for our $75 *limited-time charter subscriber discount*, simply fill in and return the coupon. Data Decisions will send you MICROCOMPUTERS to examine at your convenience, with absolutely no purchase obligation.

SPECIAL CHARTER SUBSCRIPTION OFFER!

☐ **YES.** Please have someone phone me to arrange a *no purchase obligation* TRIAL REVIEW of MICROCOMPUTERS. Should I decide to become a subscriber, I understand that, by acting now, I will be eligible for a special charter subscription price of $625—a $75 savings off the regular subscription fee of $700.

☐ Although your offer is completely risk-free, I'm still not sure. Please provide more information.

The AT&T Divestiture

Hoping for the Right Numbers

By Phil Hirsch

Photo © 1981 Stock, Boston/Inc.

Even though the Bell system will be broken up on Jan. 1, telecommunications users still do not have the answers to some important questions. Among other things, they don't know what message toll service, Wats and other heavily used communications services will cost after April 3.

That's the date on which the Federal Communications Commission's (FCC) new access charge plan may or may not go into operation, along with new rate tariffs filed by AT&T and the Bell operating companies last October. Congress strongly opposes the FCC access charge plan, and most corporate communications users strongly oppose the tariffs.

The access charge plan restructures the way local telephone companies will be reimbursed for the costs they incur in providing access to the long-distance telephone network. Historically, this reimbursement has been made through "settlements" paid by long-distance telephone carriers. Other common carriers have basically paid a similar Exchange Network Facilities for Interstate Access charge. Altogether, this "interstate contribution" amounts to about $6.5 billion annually.

Although tendered by carriers, the money actually comes out of their customers' pockets. That means it has been paid totally by long-distance communications users.

Since long-distance charges comprise a major part of most corporations' communications bills, business users are particularly eager to reduce their part of the interstate contribution. One reason that's difficult is because the contribution includes a hefty subsidy that enables local telephone companies to keep down the costs of their local services.

The political consequences of this point became clear when the FCC unveiled its access charge plan a year ago and was immediately assailed by Congress, consumer groups and state regulators. The plan imposes a monthly surcharge on all users of the local telephone network, including those who make no telephone calls at all. The surcharge is $2 per month for each residential subscriber's access line and up to $6 per month for each business access line.

According to an analysis made by the House of Representatives' telecommunications subcommittee, the residential surcharge would amount to $1.9 billion the first year the plan was in effect and $3.6 billion in the plan's sixth year. In other words, about 30% of the annual interstate contribution would be shifted the first year from long-distance users to local residential users, while in the sixth year, about

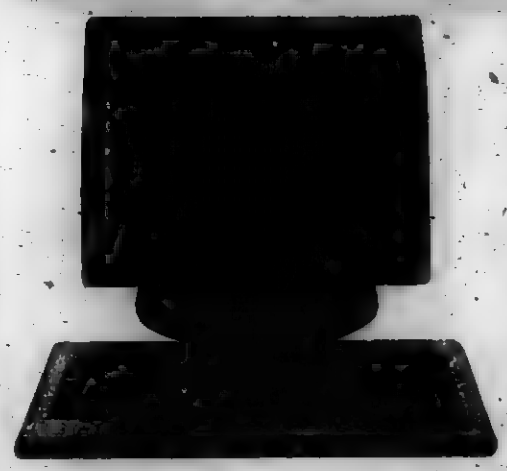
ADDS Viewpoint/Color from your point of view.

EVEN BOSSES NEED A LITTLE COLOR.



Right out of the box, the new ADDS Viewpoint/Color brings extra clarity and comprehension to any business application. Bosses like that.

They also will like the ergonomically designed detachable keyboard with its separate key cluster for numeric entry and cursor control. And the display screen which tilts from a minus 5° to a plus 15° and swivels a full 360° for comfortable viewing.

But should only a boss deserve color?

The full-featured ADDS Viewpoint/Color costs less than many monochrome terminals so there's no reason not to let color improve your communications company-wide: That makes nine good reasons to buy ADDS Viewpoint/Color terminals. Red, blue, green, yellow, cyan, magenta, white, black and price.

IT ALL ADDS UP.

ADDS
Applied Digital Data Systems Inc.

(Continued from Page 44)
55% of the total contribution would be shifted.

However, legislation now pending in both houses of Congress would bar the FCC from imposing surcharges on residential and single-line business users. If either bill is enacted, larger companies would supply a much bigger percentage of the interstate contribution than they would under the FCC plan.

The House bill (H.R. 4295) permanently bans residential and single-line business surcharges, while the Senate legislation (S. 1660) defers them for two years. The full House passed H.R. 4295 early last month; S. 1660 is scheduled for a final vote in the Senate late in January.

'Excellent Chance'

According to Herb Jasper, who probably spends more time tracking telecommunications developments on Capitol Hill than anyone else in Washington, D.C., there is an "excellent chance" the Senate will pass its bill. Jasper, executive vice-president of the American Council for Competitive Communications, an other common carriers' trade association, pointed out that the Senate bill is sponsored by a Republican — Bob Packwood (R-Ore.) — which gives it an edge in the present Republican-dominated Senate. Moreover, S. 1660 is less objectionable than the House bill to AT&T and bigger companies.

For the companies, the big advantage of the Senate bill is that it defers residential and single-line business surcharges for only two years, rather than permanently banning them. AT&T, meanwhile, prefers the way the Senate proposes to deal with the "other common carriers' differential."

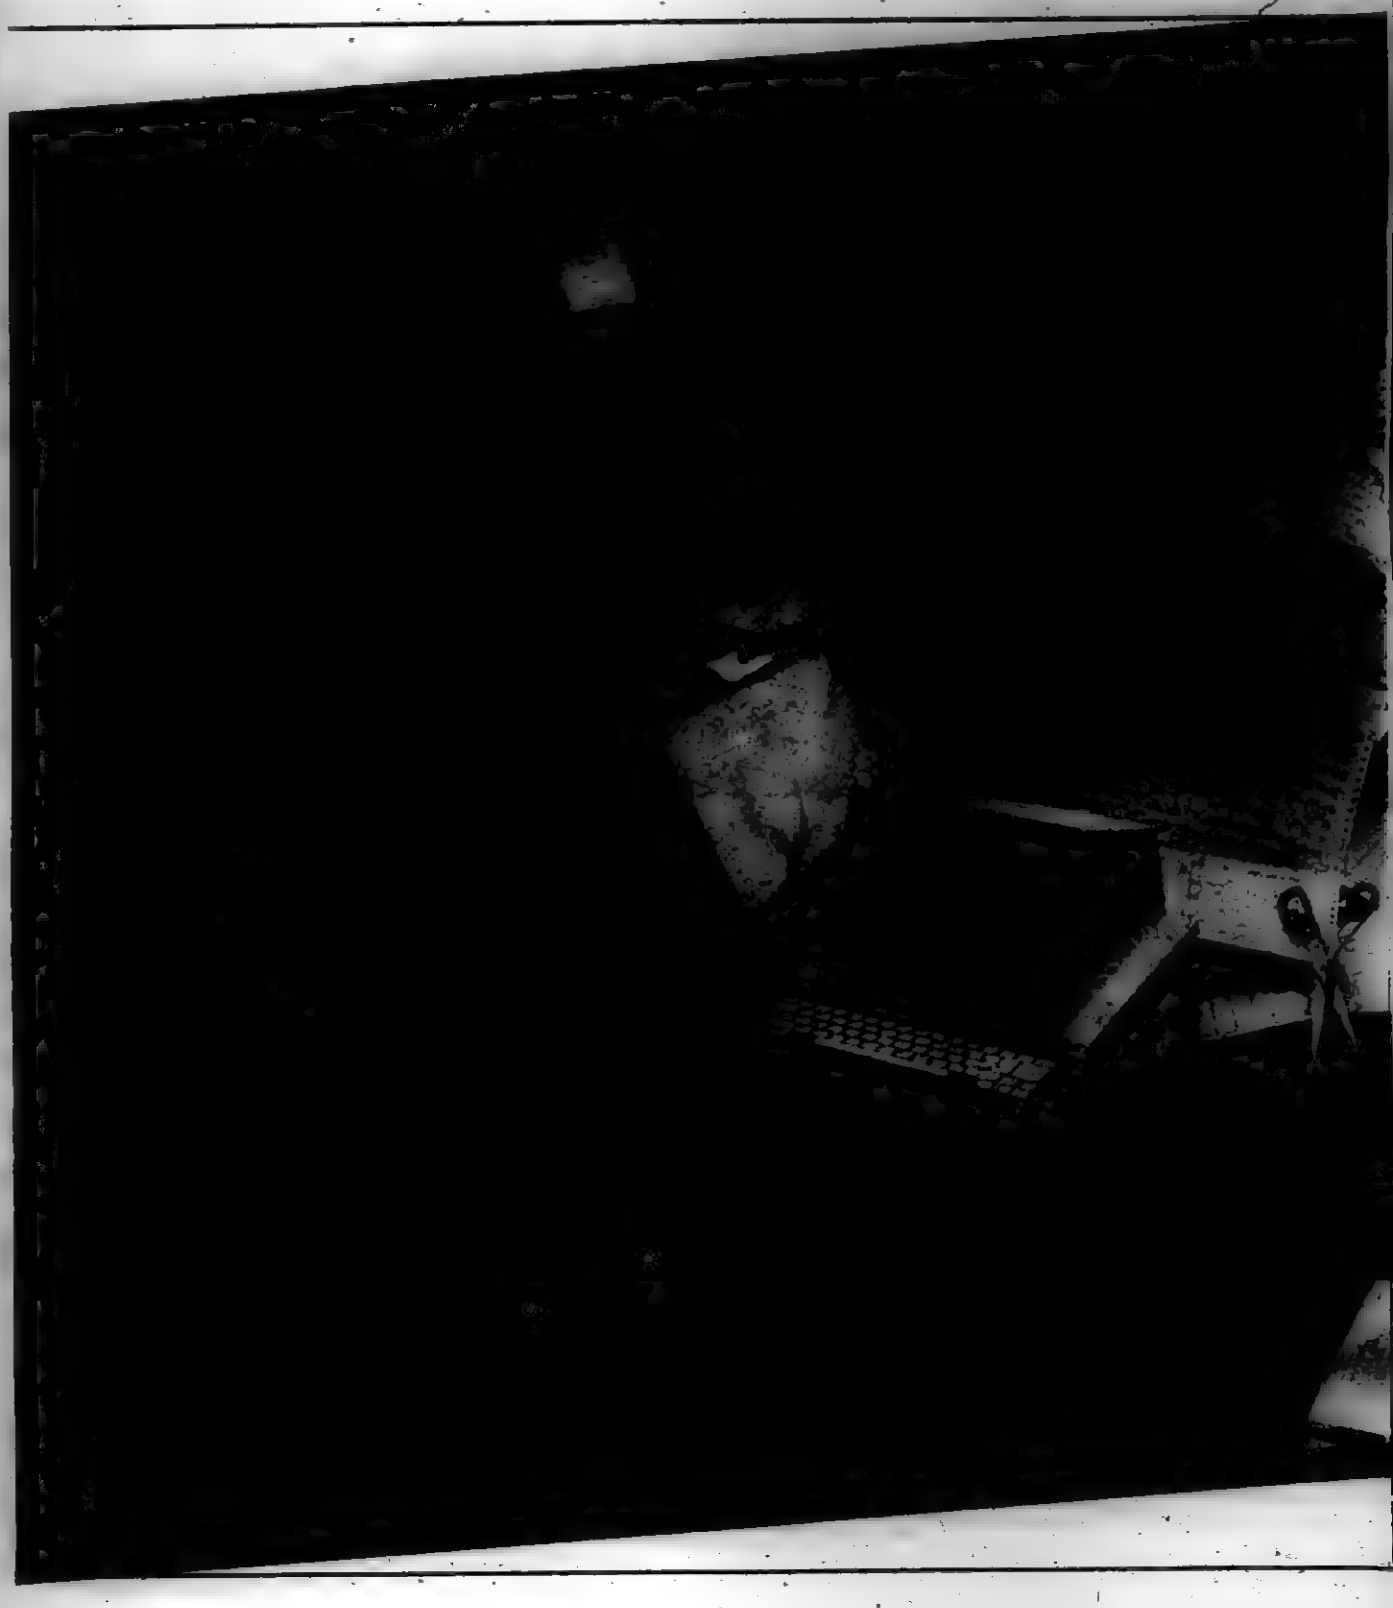
Presently, other common carriers pay considerably less than AT&T for access to local telephone networks because the other common carriers get poorer quality interconnection. (One result: other common carriers' customers must dial more digits to set up long-distance calls.) During the next two years, however, as electronic switches come into wider use, this qualitative difference in interconnection facilities is supposed to disappear gradually. Under the House bill, the differential in access charges does not start to decline until the other common carriers begin receiving improved interconnection service. Under the Senate bill, however, the differential would drop precipitously the first year the FCC's access charge plan is in effect, thereby raising the other common carriers' costs and forcing them to raise their rates relative to AT&T.

Brian Moir, Washington counsel for the International Communications Association (ICA), agrees with Jasper that there's a good chance S. 1660 will be passed by the Senate. He noted, however, that the Reagan administration and the FCC have joined the bulk of the telephone industry in criticizing the House bill directly and the Senate legislation by implication, so he thinks changes are likely before the measure reaches the president's desk.

Moratorium Option

What sort of changes? Moir — who served six years as legal counsel to the House Commerce Committee and its telecommunications subcommittee before going into private practice — believes the House bill's total ban on residential and single-line business surcharges might be replaced by a moratorium. To make this change more palatable to consumer advocates, the moratorium could be made longer than the two years specified in S. 1660 and could be phased in over more than the six years mandated by the FCC in its access charge plan.

In exchange, Moir said, the telephone carriers may have to accept the House-approved provision freez-



ing the AT&T/other common carriers' access charge differential until the specialized carriers obtain better quality interconnection.

Rate Fight Certain

Even if the access charge battle is resolved on Capitol Hill, another fight over rates is virtually certain at the FCC.

Last October, AT&T filed new interstate tariffs embodying the FCC access charge plan, and the Bell operating companies — along with independent telephone companies serving non-Bell areas — filed tariffs specifying their terms for supplying access facilities. Initial comments on the Bell operating companies' tariffs were filed late in November by about 60 organizations.

Because the carriers allegedly have failed to supply adequate information, "there simply is no basis on which the commission can conclude that . . . the estimated interstate access service revenue requirements are reasonable and reliable," said the Ad Hoc Telecommunications Users Committee, which includes such companies as Allis-Chalmers, Control Data Corp., General Motors Corp. and Sears Roebuck & Co. "There is potential in the tariffs [for] enhanced service providers, sharers and end users [to] be subjected to unreasonable, discriminatorily high local service charges."

In its comment, the ICA noted that the user must order and pay for his access circuit long before he actually uses it. The access tariffs do not require local telephone companies to maintain an inventory of access circuits, the association explained, so the only way a user can be sure of having facilities when he needs them is to file planned facilities orders.

Since planned facilities orders have to be placed at least 24 months before they are activated, "an [interstate customer] must know fully two years in advance where its new facilities will be located, exactly what facilities it will need and, if applicable, where its customers will be located," ICA said. "Plainly this type of arrangement taxes even the most sophisticated forecasting systems."

The tariffs also require the interstate customer to prepay "one full year's monthly charges in three installments over no longer than the first 14 months following the order date," the ICA observed. "Payments are due on the last day of the specified months, and any payment not received by the exchange carrier by the end of the first working day of the next month would . . . cancel the [Planned Facilities Orders]."

Most of the organizations commenting on the Bell operating companies' /tariffs said the FCC should extend its investigation beyond April 3, the date the tariffs are presently scheduled to become effective. Given this consensus, it is believed that that is what the commission will do. Although the proposed rates would go into effect on April 3, they would be subject to change at the end of the investigation, and users might even get refunds. But because both the critics and the issues are numerous, the investigation is likely to take quite a while and ultimately end up in court.

Buying Methods to Change

Besides changing the way users buy transmission services, AT&T's divestiture will drastically change the way they obtain terminal equipment. Local telephone companies, as well as AT&T Information Systems, AT&T's deregulated subsidiary, will be selling, as well as leasing, new terminal equipment after Jan. 1. Users will have the option of buying or continuing to lease their already installed terminals.

In November, the FCC adopted a plan permitting this embedded base to be sold to its present users after divestiture. However, it is not yet clear what the

CLEAR YOUR DESKS FOR THE PERSONAL TERMINAL BOOM.

Introducing a desktop revolution. The Personal Terminal from TeleVideo®—a compact new terminal for people who've forgotten what the finish on their desktops looks like. It isn't intimidating. It doesn't require programming knowledge. And it costs much less than a full-sized terminal. Clearly, the Personal Terminal will simplify the way your company works.

Want communications capabilities? Two RS-232 communication ports are standard equipment. An attached telephone option is available. And two optional, internal modems (300 or 300/1200 baud) put managers on-line with data services in seconds.

Want to expedite data retrieval? The Personal Terminal has 7 function keys (shiftable to 14) that reduce often-used commands to one key stroke. With a modem installed, those same keys can autodial up to 10 phone numbers. The built-in directory feature lets you autodial up to 18 more.

Send and receive electronic mail. Check inventory. Review sales and traffic figures instantly with the Personal Terminal. The 9-inch screen is easy to read. The professional keyboard is easy to use.

The Personal Terminal from TeleVideo. The desktop connection to a more intelligent, productive and cost-effective office environment. Isn't it time you got in on the information management boom?

Call us at 800-538-8725 for more information (in California call 408-745-7760) or contact your nearest TeleVideo office:

(Continued from Page 47)

sales price will be in every case. That's because the new owner of the equipment, AT&T Information Systems, does not plan to announce prices of several types of equipment until after Jan. 1, 1985. The list of equipment is broken down into some 20 equipment categories; it includes electronic private branch exchanges (PBX) (Series 700 and 800), data sets (Series 400, 600, 800) and various models of the Datespeed 40 terminal.

How long users will have to wait for prices after Jan. 1 has not been specified. The FCC decision allows the company to wait until Jan. 1, 1986. AT&T said that "overall, it is estimated that roughly 75% of the multiline customer premises equipment (CPE) base will be made available for sale during 1984."

For the long term, the most significant feature of the CPE decision is that it promises to give users more control over what they buy, when and from whom — thus achieving a goal the FCC has been seeking since the 1960s; the Justice Department's antitrust suit against AT&T had a similar objective. It isn't clear, however, that users will gain similar control over transmission services.

Although it will be quite a while in some cases before sales prices for some already installed terminals are announced, users will be protected by the fact that several competing manufacturers offer similar equipment. The FCC order limits what AT&T can charge to rent embedded terminals between Jan. 1, 1984 and the date they are offered for sale. The order also limits what AT&T can charge to lease or rent terminals for a two-year period after sale prices are announced, thus giving users plenty of time to decide whether to retain or replace the equipment.

In the case of transmission services, the situation is much murkier. Not only are Congress and the FCC arguing about the commission's access charge plan, but telephone companies and their customers are arguing about the tariffs that implement that plan.

But there is another problem that may be even more significant.

Although AT&T currently carries over 90% of this country's interstate communications traffic, and most observers do not expect that percentage to decline markedly for a long time, former U.S. Assistant Attorney General William F. Baxter told Congress he believes the intercity market is on the verge of becoming competitive. His view is significant because the Justice Department has primary responsibility for monitoring the post-divestiture behavior of AT&T and the divested Bell operating companies.

In Congress, meanwhile, and at the FCC, great sympathy is being explicitly and implicitly expressed for the Bell operating companies. One indication: both S. 1660 and H.R. 4296, the pending telecommunications bills, tax users who bypass their local telephone company networks. However, all of the operating companies significantly threatened by bypass services have the resources to upgrade their networks so that business customers will be discouraged from migrating to bypass technology, and many of them are building upgrade facilities right now.

In other words, it is questionable whether any help is needed from Capitol Hill.

Last month, the FCC decided that the Bell operating companies, after divestiture, must abide by a "modified" interpretation of the Second Computer Inquiry decision. That decision says, essentially, that if AT&T or any of its operating company subsidiaries markets "enhanced" services or terminal equipment, it must be done through separate subsidiaries on a deregulated, nontariffed basis.

Possibly the most significant aspect of last month's FCC action was that three of the four commissioners who voted for it — Mark Fowler, Henry Rivera and Mimi Weyforth Dawson — did so reluctantly. They had expressed strong doubts about whether the divested Bell operating companies really need to be saddled with separate subsidiaries.

It is at least conceivable, though, that dimming the bright line separating regulated from unregulated services will enable the Bell operating companies to retain their present monopoly control of local exchange services. AT&T's long-distance monopoly may also be strengthened.

Ever since 1981, when Computer Decision II was issued, AT&T has been trying to do away with it. November's FCC decision could give this campaign a tremendous boost, particularly if, as seems certain, some Bell operating companies are allowed to establish unseparated divisions in place of separate subsidiaries.

As a result, it is quite likely the most important question facing the FCC and telecommunications users in 1984 will be whether Computer Decision II's bright line remains in place and preserves the limited competition achieved so far.

Shared DASD users, don't leave your data integrity to chance.

Protect it with Super-MSI™, the integrity protection package designed exclusively for multiple-CPU environments.

Easy to install. Easy to maintain. Super-MSI requires no modifications to your operating system and can be implemented in an active system in as little as ten minutes—assuring complete data integrity from the moment it is installed.

Super-MSI guarantees data integrity.

No complicated job scheduling. No elaborate control schemes. No software changes. Super-MSI spans inter-system activity to give "unified system" integrity to your entire multi-system complex.

Super-MSI preserves integrity under MVS, MVS-SE, MVS-SP, SVS, MVT, VS1 and MFT systems.

Super-MSI prevents data destruction.

Inadvertant modification, simultaneous access ... Super-MSI stops the damaging data abuses that multiply in a multi-systems environment. Prevents the errors that can so easily occur—and too often go undetected—when users operate in a multi-systems complex.

Super-MSI eliminates hardware RESERVEs.

Super-MSI completely protects your data integrity and frees your systems of RESERVEs and RESERVE lock-outs. Super-MSI converts selective RESERVEs to logical controls that securely protect your data without inhibiting system throughput.

Super-MSI does more.

As part of the CGA family of single-image software for multiple-CPU sites, Super-MSI works together with MSM®, our Multiple Systems Manager which manages tape and disk storage devices and GCD®, our Global Console Director which consolidates consoles, cutting costs and streamlining operations. The result is a unified single system image that is transparent, flexible and powerful. Use them together or in any combination. CGA's multiple systems software is a must for large users.

More than 1,000 CGA single-image software packages are in use around the world, preserving data integrity and helping multiple-CPU sites hum like they're supposed to. Call today. Set up a free trial of Super-MSI, GCD or MSM.

Speak software. Talk to CGA.

White-Collar Crime

The Enemy Within

By Robert Batt

While the movie *War Games* and the recent spate of well-publicized computer break-ins have focused attention on the threat from outside hackers, the management information systems professional faces a potentially more damaging intrusion of corporate data from his own employees.

According to a recent report from the New York-based Research Institute of America (RIA), an estimated $70 billion is lost each year to white-collar, computer-related crime, fraud and embezzlement, of which up to 75% can be attributed to insiders.

"DP-related crimes originating from within the company itself are by far the biggest part of the problem. For example, it is much harder for outside hackers to identify the vulnerabilities of a software system than the insider who has access to the system for a much longer period of time and who knows the operating procedures of the company," commented Bob Abott, president of EDP Audit Controls, Inc., an Oakland, Calif.-based security consultant.

Since huge quantities of information are concentrated in one place, sensitive data can be easily copied or stolen, the RIA report, titled "Safeguarding Your Business Against Theft and Vandalism," pointed out.

In a world of large-scale data banks, information can be directly entered into a computer without any written record or proper authorization, and it can be changed without leaving any trace.

A dishonest programmer can bypass controls and surreptitiously enter information into the system, authorizing his own transactions, RIA said. "Many records can be altered in a brief period. An embezzler can alter just so many written checks or records in a given time. Given access to a computer, however, he may get away with millions in minutes," the RIA report said.

Banks, for example, have been the victims of a swindle called "breakage." The dishonest employee, assigned to distribute interest to customers' accounts, programs the computer to deposit in his own account the odd fractions of a penny or dollar left over on many accounts. It's a difficult threat to detect, said Barry Bergman of the San Mateo, Calif.-based Barrick Security Group, because an audit reveals only that the correct total interest was paid.

"The audit trail is invisible. This makes checking and cross-checking of data more difficult for people

(Continued on Page 52)

TX

The most powerful on-line

Today, the world of business computing is being introduced to a system featuring over two-and-a-half times the performance and twice the price/performance of its nearest competitor.

A versatile system. Able to compile the information of the largest corporations into a single relational data base. Instantaneously updated and fully available across the entire system.

An expandable and compatible system. Allowing the simple addition of future programs and equipment, without sacrificing past investments.

And most importantly, a system that won't let you down. Because its fault-tolerant design won't let itself down. Even if a major component fails.

This system isn't from IBM.

It's from Tandem.

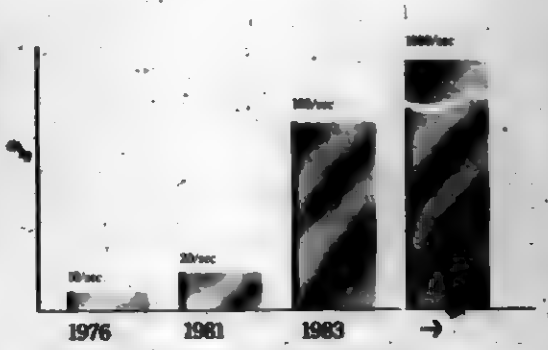
Introducing the NonStop TXP™ system.

TXP: 32-bit transaction processing.

The TXP system processes high-volume loads faster and more economically than any other system. Executing over 100 transactions per second now and thousands of transactions in the near future.

It's built around multiple parallel 32-bit processors. Each addressing 16 MB of physical memory and over a gigabyte of virtual memory.

To help memory keep pace with that kind of processing, TXP pulls 64 bits on each memory access.



Our success can be summed up in a second. *Transactions per second. Numbers unsurpassed in the industry. On-line systems that fit your needs today. And tomorrow. With more processing power on the way.*

The TXP system also features parallel data paths. Manipulating 32 bits of information in a single cycle, two 16-bit operations in the same cycle.

And TXP incorporates extensive pipelining, to process multiple instructions simultaneously. Each processor overlaps instructions in three levels: Fetching one, while preprocessing a second, while executing a third.

While helping TXP deliver full 32-bit power, for less.

Cache memory pays off in faster response times.

Cache memory is a high-speed data storage area between the processor and main memory. It lets the processor store more frequently used information closer. So it can get to it faster.

And our tests have shown that the TXP cache memory has a 98% "hit rate." Which means the requested data is virtually always nearby for fast access.

The result? Larger volumes of work can be processed in shorter amounts of time. Helping TXP to be even more productive.

Making cache memory pay big dividends.

A system you'll expand, not disband.

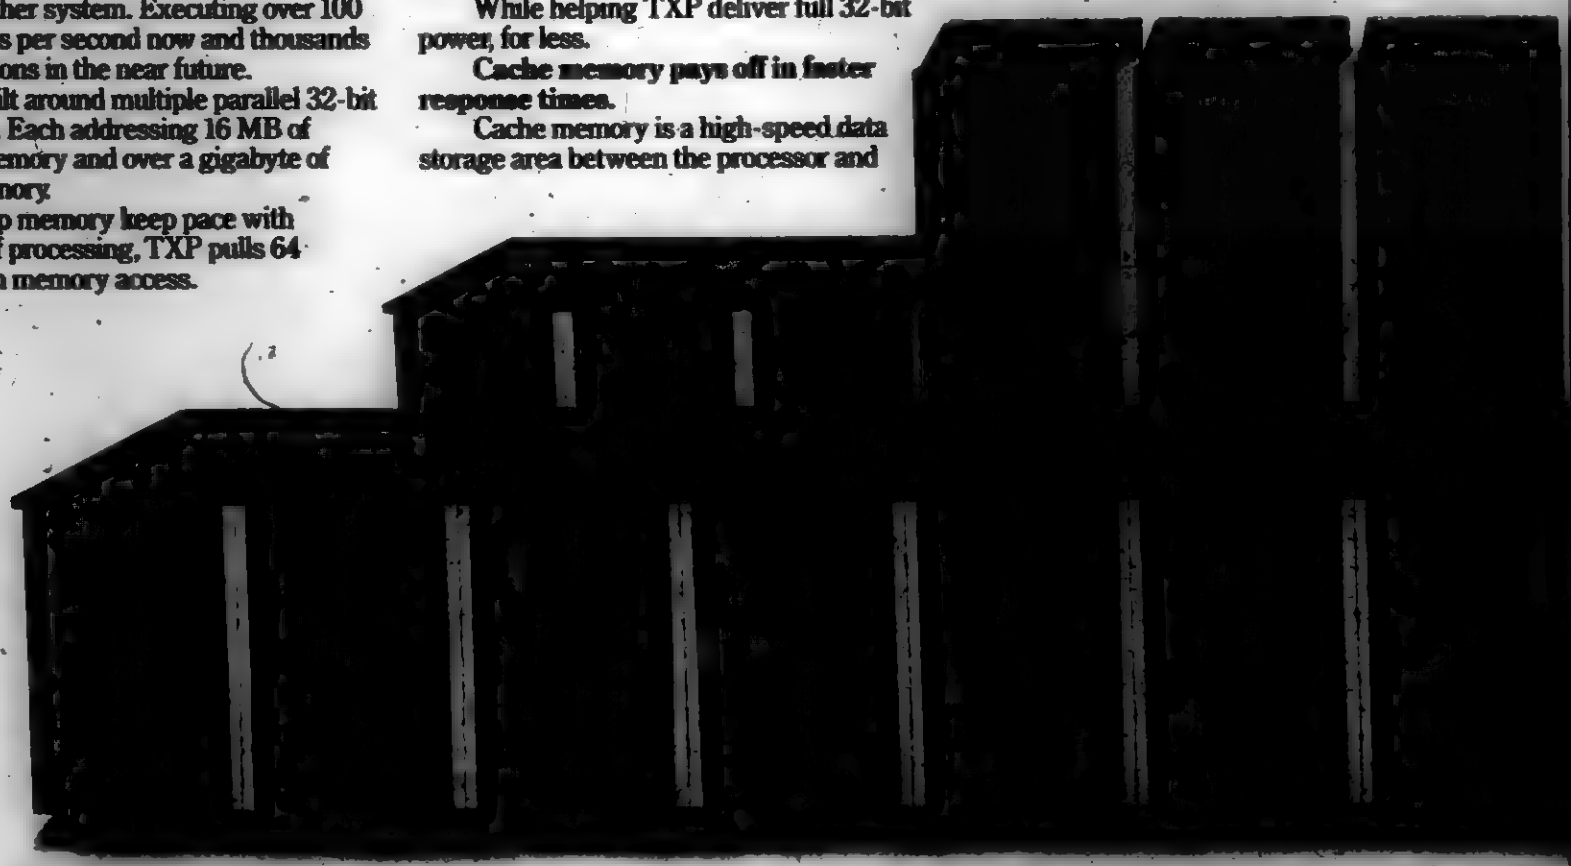
Most computer systems have very limited expandability. So if a company outgrows its computer's capacity, it usually means starting again from scratch.

Selecting and buying a larger and more expensive system.

Then reprogramming.

Then re-training.

Plus all the chaotic disruption and



XP

computer in business today.

massive loss of revenue that's unavoidable during the switch-over.

Not so with the TXP system.

It can expand from two to 16 processors. Increasing its power by a factor of eight.

That's more power than any of the largest mainframes.

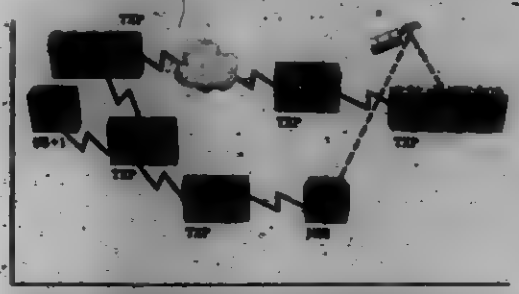
And the additional processors can be installed while TXP is running at full speed. No downtime. No reprogramming.

Still not enough power? Up to 14 TXP systems can be joined together by high-speed fiber optics. Linking the systems together as one computer with 224 processors.

But that still isn't the full potential of the TXP.

TXP systems at up to 255 sites can be joined in a worldwide network. Generating the power of over 4,000 processors.

And that gives TXP the most powerful on-line computer capacity in business.



The most powerful computer network in business today. *Users access a single unified global data base from any of thousands of terminals anywhere in the system.*

Expandability our competition wishes they could disband.

NonStop™ system compatibility from the people who started it all.

TXP can process more information and support more programs, users and devices than any other computer designed for on-line transaction processing.

Devices you most likely already have.

Even devices made by IBM.

But what if your company isn't quite ready for the TXP system's awesome power?

We suggest the Tandem NonStop II™ system. The second most powerful on-line computer in business today. The cost effective solution for medium to large corporations.

What if your company is somewhere between a Nonstop II and a TXP?

No problem. They can be combined. They can share the same data and programs. In fact, NonStop II and TXP processors can coexist in the same cabinets.

And what if your company needs even a smaller computer? We make a smaller computer. The Tandem NonStop 1+ system. Perfect for those low-volume sites where less processing power is needed.

Tandem literally wrote the book on NonStop™ transaction processing. That's because we introduced the first NonStop system.

Over eight years ago.

And for over eight straight years, despite attempts by others, we've continued to lead the industry.

Learn all about TXP, ASAP.

For complete literature, contact your local Tandem Sales Office.

Or write Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014.

Or call us, toll-free. (800) 482-6336.

TXP is the most powerful on-line computer in business today.

Without question.

WHITE-COLLAR CRIME

(Continued from Page 49)

used to dealing with ledgers and accounts," RIA pointed out.

According to Doug De Vries, computer security manager at Hewlett-Packard Co., as computer systems continue to expand and more people are connected to them, the risks of fraud and embezzlement increase, particularly through the use of computer networks linking personal computers with corporate mainframe data.

Enormous Potential

"Within three years, with the use of micros widespread throughout the office environment, the potential for misuse of information will be enormous," he warned. Both Digital Research, Inc.'s CP/M system software and Microsoft, Inc.'s MS-DOS operating system contain no passwords, and a would-be thief can copy what he wants, De Vries added.

In a recent speech to DP managers in Lake Tahoe, Calif., the HP executive declared, "Computer security is a growing problem because of the greater business dependence on DP. Vital corporate assets are involved, and distributed systems are becoming more complex. There is good reason to be worried about threats to the continuity of the integrity of corporate information."

Added Peter Neumann, assistant director of the computer science laboratory at SRI International, Inc. in Menlo Park, Calif.: "When you now think of the number of on-line data bases that are accessible by phone lines and the potential for altering critical data which could even threaten human life, you begin to shudder at the risks we are taking with inadequate computer security."

The RIA report noted: "Sensitive information can be stolen without anyone being present. A person at a remote terminal who knows how to bypass the codes and passwords can illegally retrieve information without leaving any clues to his identity."

Home Computing

The advent of home computing is going to add mightily to the problem, remarked Charlie Charlebois, director of international operations at the Tampa, Fla.-based security consulting firm of Stanley/Wacker, Inc.

Charlebois, a former Central Intelligence Agency staffer, said the introduction of home banking systems, for example, will confront data security managers with problems they have never had to face before.

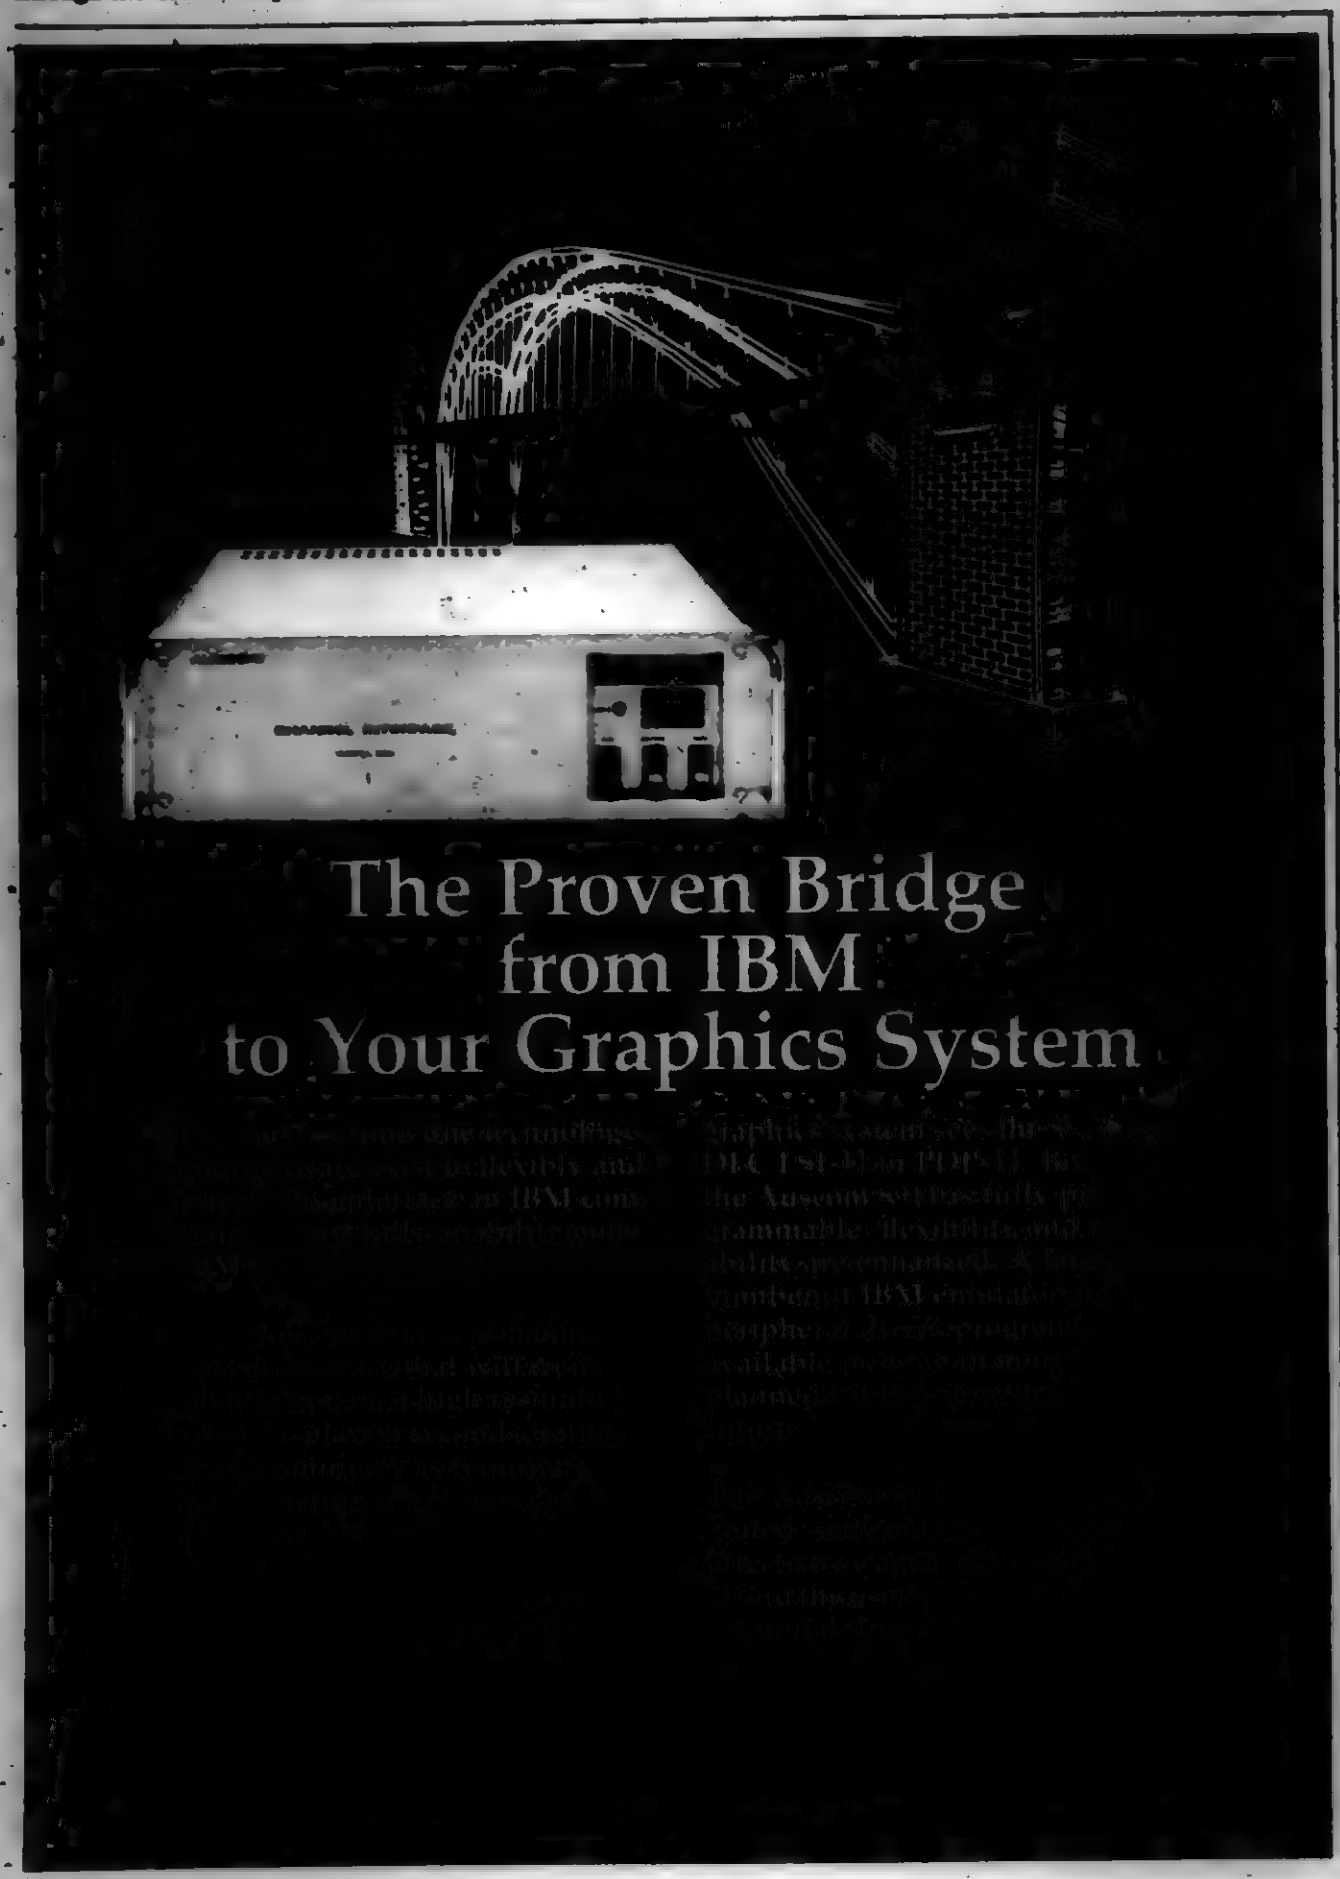
"There is definitely a danger in home computing because you have very little control, unlike security in your own building. Employees, particularly scientists and engineers, are now able to take classified information home, and the chances of abuse are markedly increased," Charlebois commented.

The explosion in microcomputers, while creating increased headaches for the computer security manager, offers the opportunity to increase corporate awareness of the need to protect corporate information and data rigorously, according to John O'Mara, executive director of the Boston-based Computer Security Institute.

"The theme for 1984 is the need to convey a sense of urgency. Awareness is the key to this problem. Security needs to have the [consent] of senior management, which will come out of the recognition that you can have protection without spending hundreds of thousands of dollars," he remarked.

For now, the battle appears to be an uphill one. According to De Vries, technology is the driving force in the computer field, with security desperately trying to catch up.

"It's going to be a tough business to be in, because as a security manager you are never going to catch up fully," the HP security manager concluded.



WHITE-COLLAR CRIME

DP Crime: Where There's a Will, There's a Way

The first thing an industry expert will tell you about computer security is that no system is absolutely secure. When it comes to abusing corporate data, the old maxim of "Where there's a will there's a way," seems to apply to white-collar data processing criminals.

According to Peter Neumann, assistant director of the computer science laboratory at SRI International, Inc., "escalation" is the key word for those most concerned with denying employees unauthorized access to company data bases.

"Computer security is not a 100% thing. As systems improve, the types of security penetration will become more sophisticated and require more technology.

"While the likelihood of such a penetration is small, the risks are high, because in these days of corporate networks storing masses of vital information, it is the kind of crime that can destroy an entire company or even industry," Neumann attested.

The problem of trying to protect data from the unscrupulous insider is made even more difficult by the fact that many companies refuse to believe they have serious security problems. The "common reaction to business crime reports, consultants claimed, is, 'But our employees wouldn't steal.'"

Neumann's colleague, Donn Parker, senior management systems consultant at SRI, said that covering up a computer malpractice is also common because companies fear the effect of adverse publicity upon their businesses and future security efforts.

Parker has collected data on more than 1,100 reported cases of computer abuses.

"We believe that most cases of computer crime go unreported. Every computer security review we have done has revealed a significant number of computer-related losses that have not been reported," he commented.

Specific Steps

However, many experts agree that a number of specific steps can be taken by corporations to protect their data from employee misuse.

According to Doug De Vries, computer security manager at Hewlett-Packard Co., several factors should be evaluated in determining what security procedures a company should implement. These include:

- The role of computer systems in a company.
- The asset value of DP resources.
- The impact of downtime on the people depending on the DP resource.
- Rating the scale of probability of information vulnerability.
- Providing protection to the appropriate degree.

"Users must consciously choose protection based on the level of risk rather than close their eyes and hope that disaster will not strike. Ensuring the integrity of data is not free and, as a rule of thumb, 1% of a company's annual budget should be spent on data security," he urged.

De Vries outlined a number of specific actions a company can take to improve its security. These would include:

- Assigning a manager to deal with computer security who reports directly to the management information services director.
- Issuing written policies about security.
- Instituting regular, but unannounced, DP audits.

(Continued on Page 54)

WHITE-COLLAR CRIME

(Continued from Page 53)

- Analyzing and implementing data security controls for the company as a whole, for specific data centers and programming groups.
- Developing computer security teams that involve the whole organization, not just the DP department.

In a recent report titled "Safeguarding Your Business Against Theft and Vandalism," the New York-based Research Institute of America recommended a number of procedures that can be implemented to help improve security. For example:

- All computer tapes and disks should be kept in a library where they can be logged out only with an authorized signature.
- Files should be classified in terms of their degree of sensitivity to the company, with sensitive material being kept under lock and key in its own locations, accessible only to those authorized to work with the data.
- DP managers should insist on controlling the number of personal computer users and a log-in procedure for terminal users.
- Passwords should be carefully designed and controlled.

While creating a climate of awareness about the importance of security is an essential first step, technology must also play a role in deterring the would-be insider criminal.

According to SRI's Neumann, success in this area to date has been limited. "A great deal of research still needs to be done. Currently, there are small solutions for small problems, but there is no global solution to secure emerging technologies such as sophisticated computer networks.

Nevertheless, some progress is being made, industry experts claimed. Among the software security packages on the market are IBM's Resource Access Control Facility; ACF 2, developed by SKK, Inc. of Rosemont, Ill. for MVS, VS1 and VM users and marketed by Cambridge Systems Group; CGA Software Products Group, Inc.'s Top Secret; and Security Access Control from Electronic Data Systems Group appear to be the most popular, according to the observers.

On the hardware side, dial-up/call-back security devices are available from Digital Pathways, Inc. of Palo Alto, Calif., and San Francisco-based Leemah, while Futurex Security Systems of Fair Oaks, Calif., specializes in microcomputer encryption devices.

Encryption, however, has yet to achieve market favor. Most companies, De Vries said, only want to encrypt 5% of their most sensitive information and view the techniques as expensive. Neumann of SRI agreed. "There is this naive view that all you have to do is encrypt everything," he said scornfully.

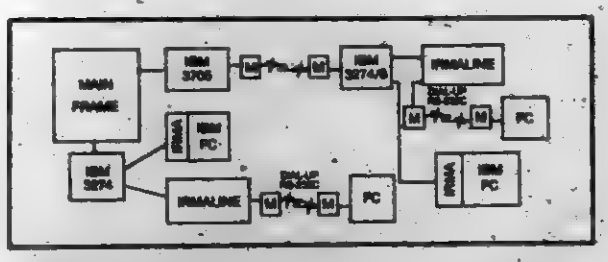
Voice-activated systems are now beginning to appear on the market. According to Research Institute of America in its report, one of the most interesting of these devices is a product called Computer Entry from Philadelphia-based manufacturer IMM Corp.

The product screens all calls from remote locations and allows valid callers to access particular files in the computer. When the computer phone number is dialed, a digital voice asks for identification.

If an incorrect code or no code is given, the voice may either ask the caller to try again, allowing for the possibility that an authorized user made a dialing mistake, or the modem may be immediately deactivated, not to be used until it is manually turned on. A third possibility is to have the device divert the call to a special phone in the data center for verification.

"While it's not clear to me that there are long-term solutions other than to continue to refine the computer operating software and architecture, manufacturers are slowly realizing there is a market for computer security devices," Neumann said.

Here are two beautiful ways to get small computers on line with the mainframe quickly, easily and economically—yours from DCA, home of the industry's first coaxial cable links between small computers and IBM 3270 networks.



IRMA is the Decision Support Interface that gets IBM Personal Computers and IBM PC XTs into the 3270 mainstream via direct attachment to 3274 or 3276 controllers.

IRMA, IRMALINE, and Decision Support Interface are trademarks of Digital Communications Associates, Inc.

WHITE-COLLAR CRIME

Security Message Often Falls on Deaf Ears

"If anyone assumes that they have a completely secure computer system, they really have their head in the sand."

That comment from Peter Neumann, assistant director of the computer science laboratory at SRI International, Inc., sums up the seriousness of the situation facing security managers as they attempt to strengthen protection of their data processing systems from internal misuse.

Yet getting senior management and department heads to admit that a problem exists in the first place is a major exercise in communication, industry experts agree. When it comes to instilling a passion for securing one of the company's most vital assets — information — the message often falls on deaf ears.

"In the corporate culture, most people do not recognize that data may be of importance to someone else, and so while they are aware of the convention about security, in practice they do not do much about it," remarked security specialist Barry Bergman of Barrick Security Group.

According to Bill Stark, president of Stanley/Wacker, Inc., a Tempe, Fla.-based consulting firm, one of the most crucial areas where security considerations are ignored is in hiring new personnel. "There is such a frenzy for people to be hired, particularly in a small high-technology company that is expanding rapidly, that managers do not take the time to do the checking on new employees and singling out potential risks," he said.

Once a company has been burned, Stark continued, they are reluctant to admit to a breach of security, especially in the financial community where such an admission can lead to a rapid loss of credibility and funds. "They don't want to prosecute in order to avoid the adverse publicity, and they even fail to inform other prospective employers if asked to provide a reference for the felon," he asserted.

In many ways, therefore, misuse of corporate computer resources is a hidden problem. "It is going to take a couple of really mammoth computer heists to galvanize opinion in the data processing community and prompt effective action," Neumann added.

The employees who turn out to be computer criminals are hard to detect in advance. According to Donn Parker, senior management systems consultant at SRI International, who has interviewed over 40 perpetrators of computer crime, they are white-collar workers who see themselves as problem solvers and consider themselves basically honest. They view the use of computers against a corporation as an intellectual challenge rather than a crime to be punished.

The New York-based Research Institute of America (RIA) has recommended a number of hiring procedures designed to identify would-be troublemakers. It recommends companies:

- Design an application form that provides enough detailed information to enable a manager to verify the applicant's statements and dig more deeply into areas not mentioned.
- Verify all information given, including academic and job background.
- Query references in person or by telephone rather than by a form letter.
- Bring in an investigator for preemployment screening of applicants for sensitive company positions.

A clear indication that

(Continued on Page 56)

IRMALINE does the same for remote IBM PCs, IBM PC XTs, Apple Lisas and DEC Rainbows, among others, with just a local phone call to a nearby 3270 controller.

Both can go to work literally minutes out of the box. Both provide mainframe data access, selection and storage, and data communication back to the mainframe.

Put first things first. Find out more about the DCA first family of 3270 micro/mainframe connections. For information, write DCA, 303 Technology Park, Norcross, Georgia 30092. Phone (404) 448-1400, TLX 261333 DCA ATL. Or call us toll-free (800) 241-IRMA.

The new home of IRMA, IRMALINE and the rest of the TAC family.

WHITE-COLLAR CRIME

Consultant Calls System Software Weak Link

While many experts agree that banking, financial services and brokerage houses are the most vulnerable sectors for internal data processing crime, it is in a company's system software that the true security weaknesses lie, according to Bob Abott, president of EDP Audit Controls, Inc.

The Oakland, Calif.-based security consultant stressed that the key to secure data systems lies in increasing protection for the company's operating system and application software.

The former research worker at Lawrence Livermore Laboratory said that many software programs have properties that reveal themselves to users over time, properties that were not intended by the authors. As a result, a would-be criminal is able to begin construction of a knowledge base that can be used to abuse corporate data.

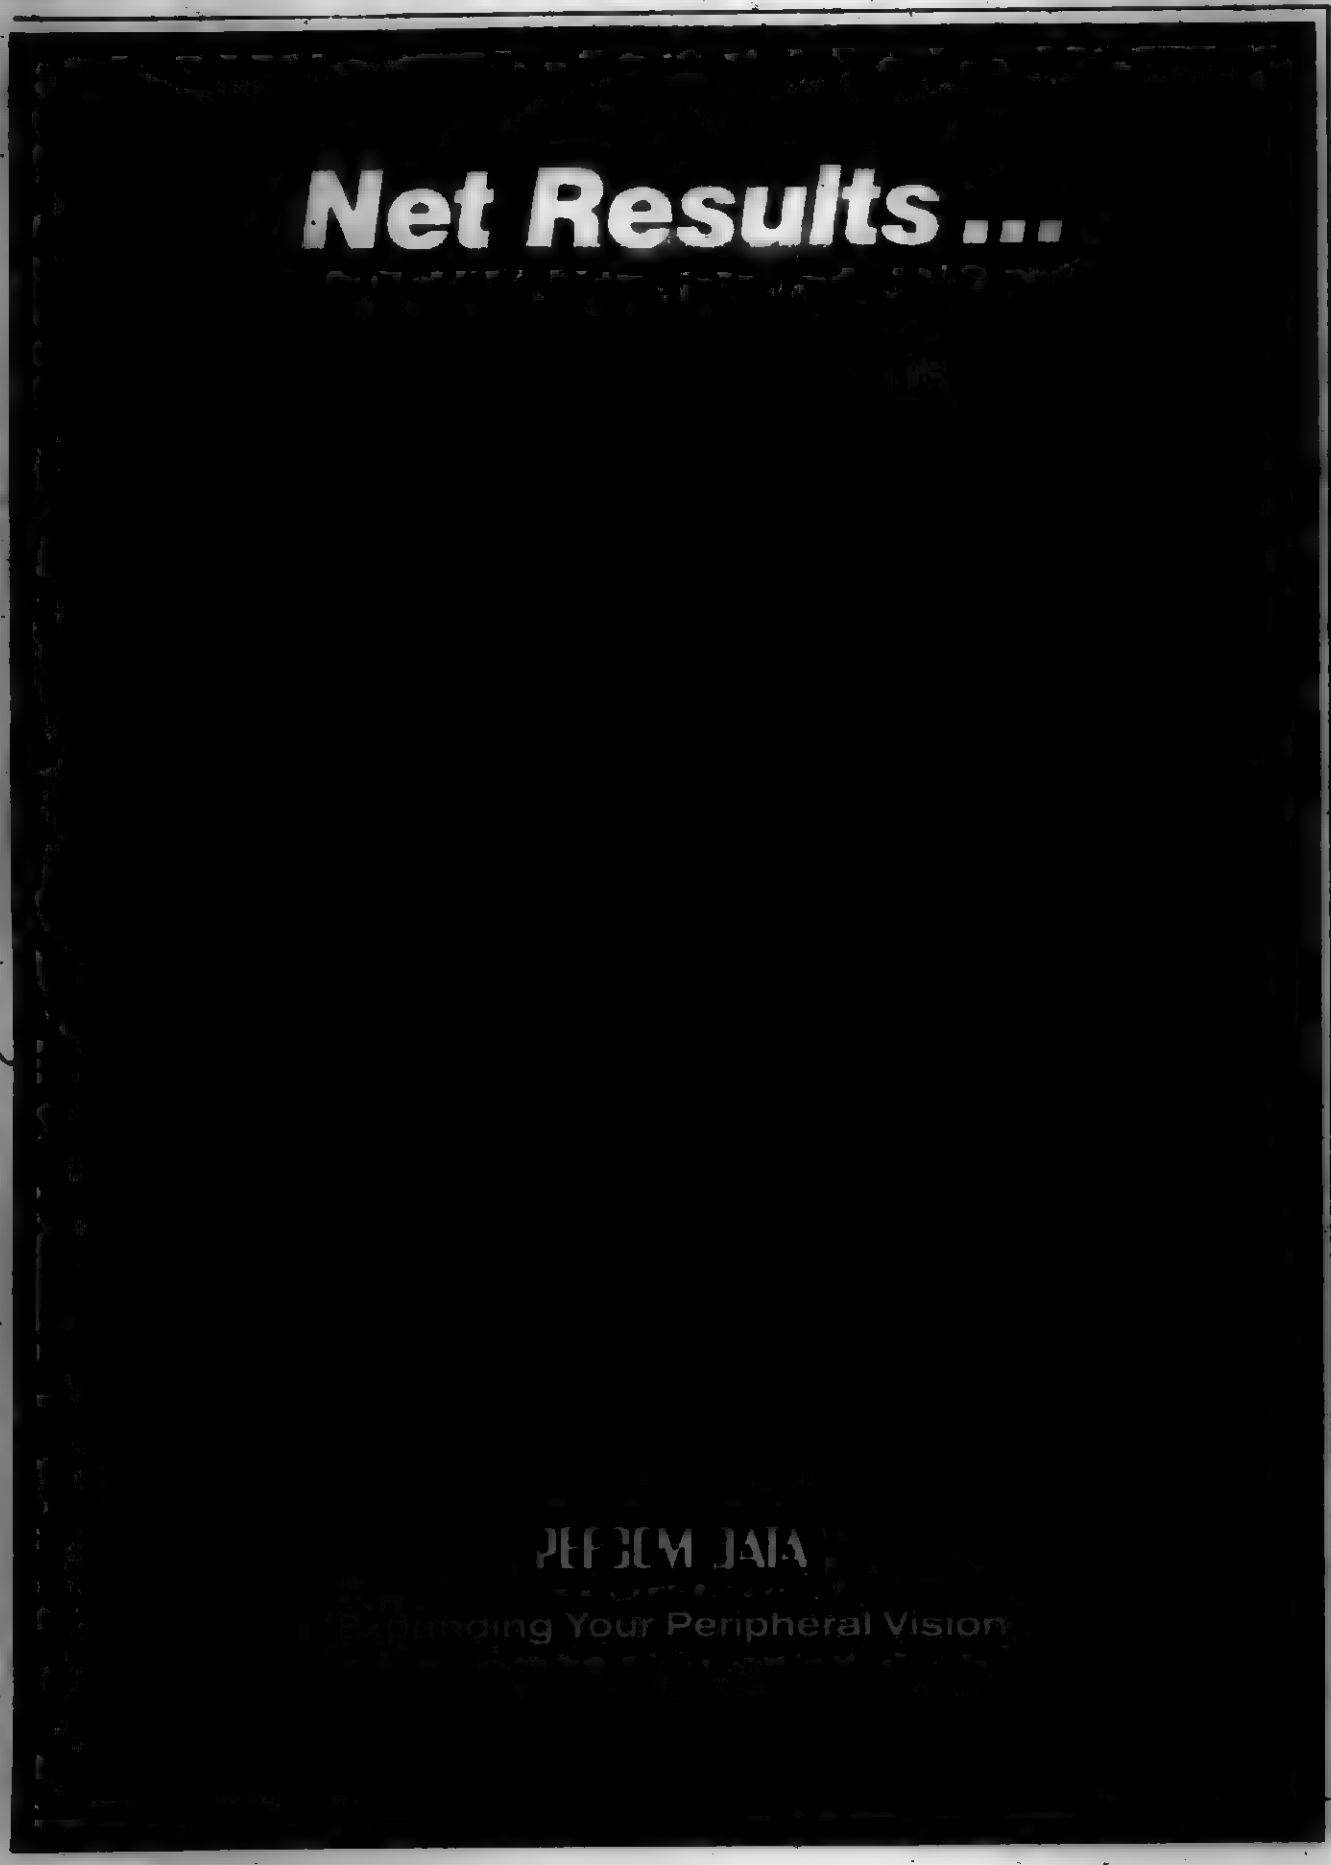
In a book titled *Security Analysis and Enhancement of Computer Operating Systems*, Abott has outlined the glitches in system software that allow security intrusions to occur. These include:

- Incomplete and inconsistent parameter validation.
- Implicit sharing of privileged or confidential data.
- Asynchronous validation or inadequate serialization, that is, timing errors brought about by the software itself.
- Inadequate identification, authentication and authorization of control access to software.
- Violation of prohibition or limit to software capabilities.
- Exploitable logic errors.

While radical improvements have been made in securing mainframe software over the past decade, he added, this knowledge base has not been applied to microcomputers. "Many personal computers have been designed with many of the flaws that pervaded mainframe software in the 1970s, because the people designing the new systems have not been schooled in computer security problems.

"The question is: Does the design of that new system software take into account the lessons of the past decade in computer security? How is it to be tested?" Abbot said.

Abott suggested, as one possible solution, the inclusion of a mandatory independent third-party statement attesting to the fact that a vendor's software meets industry-accepted standards.



Awareness Of Security

(Continued from Page 55)

the security problem is increasing comes from the Boston-based Computer Security Institute, which has seen its membership grow to more than 3,000 organizations in the last year. Its role is to emphasize practical, cost-effective long-term solutions to the problem of security through conferences and newsletters.

In order to generate more support for increased computer security, most industry analysts agree that senior management must get more involved. They must understand that no adequately secure commercial computer system exists today, based on the value of the data stored and the machine's processing capability.

Until more far-reaching progress is made, the potential for a major computer crime, bordering on a disaster, will persist.

Computer Crime

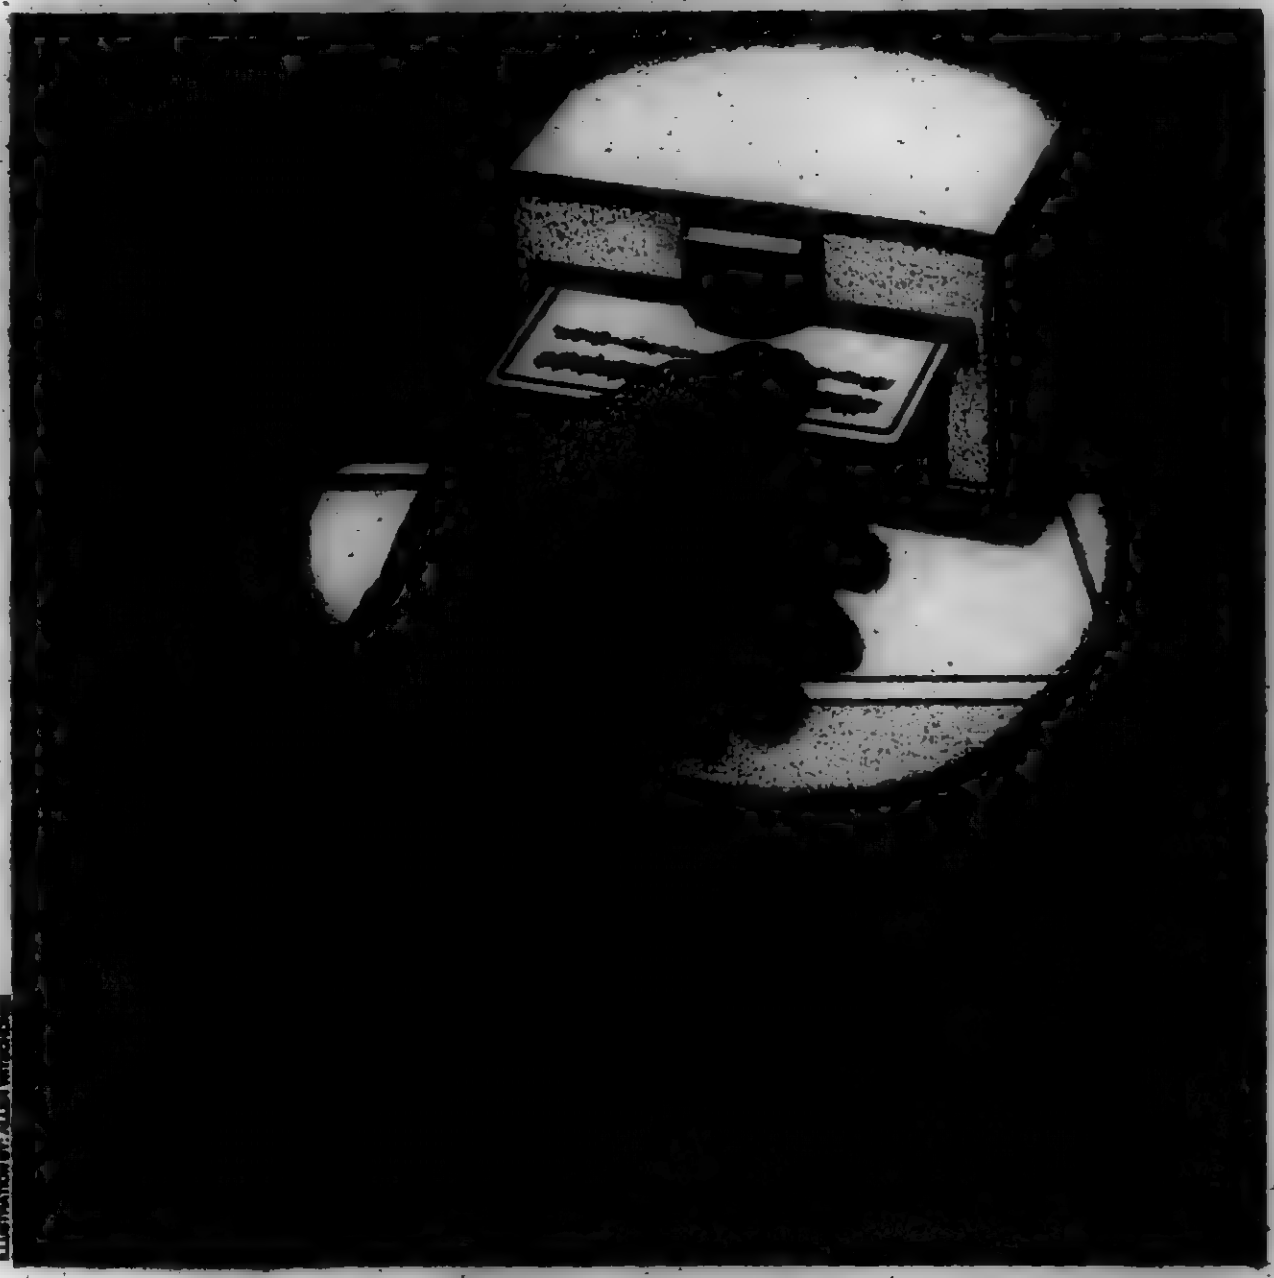


ILLUSTRATION BY: ALLEN WITCOMB

A Worldwide Concern

By Susan Blakeney

So you think the U.S. has the market cornered on computer crime?

Think again. According to an international survey recently conducted by *Computerworld*, computer criminals are popping up just about everywhere there's a computer. While the U.S., because of the sheer number of computers within its boundaries, may still take dubious credit for the lion's share of computer-related transgressions (annual U.S. losses are estimated at $100 million), some analysts say it's only a matter of time before the rest of the white-collar universe follows America's lead and catches the computer crime fever sweeping the U.S.

Computer industry watchers from seven countries contributed to the *Computerworld* survey: Australia, Brazil, France, Italy, Japan, Sweden and West Germany. Six of the seven respondents agreed that computer crime was considered a major problem in their country.

In Brazil, the banking industry is especially vociferous on the subject of computer crime. While they offered no estimates on the dollars lost to computer invasions, Brazilian bankers are said to be scrambling to wage a counterattack.

In Japan, losses to date are estimated at $30 million. In Sweden, authorities maintained that the computer crime problem costs $10 million a year — most of which they attribute to the illegal copying of software for resale on the black market. In West Germany, the average computer crime is valued at between $200,000 and $500,000, with an official annual figure unavailable at this time.

Then there's Italy, where "stealing is the way we do business," according to one industry expert there who requested anonymity. Here computer crime is considered a critical problem, but not as much as during the reign of the Red Brigade (the terrorist gang probably best re-

(Continued on Page 58)

COMPUTER CRIME

(Continued from Page 57)

membered for holding U.S. Army Brig. Gen. James L. Dozier hostage for over a month at the end of '81). Apparently, the frequency of computer sabotage during that period prompted many companies to hastily implement physical security measures, "so the average security level can be considered good today," the survey revealed.

Even in Australia — the one country in Computerworld's survey claiming computer crime did not pose a big threat — there have been 124 computer crimes reported, with damages estimated at $5 million. Furthermore, Australian computer security consultant Kevin J. Fitzgerald stressed, "What this represents as a percentage of the actual total, we don't know."

Fitzgerald did say, however, that computer crime is an extremely slippery subject for several reasons. First, many computer crimes are only discovered by accident, so nobody really knows how much damage is being done. At the same time, most companies don't want to admit publicly they have fallen victim to computer crime — especially banks. An expert in France summed up that nation's corporate attitude toward computer crime by saying, "They ignore it . . . if they can."

On the other hand, the Japanese police department, which conducted its own survey on this subject, discovered that "most companies don't ignore the problem of computer crime . . . but only 32% of them take measures to cope with it."

Computer Sin List

When asked what type of computer crime happens most frequently, the international experts overwhelmingly placed "copying and stealing software" at the top of the computer sin list. Other violations, in descending order of frequency, include:

- Input of unlawful data.
- Altering or destroying magnetically recorded data.
- Sabotage.
- Stealing information.
- Illegal use of computers.
- Illegal electronic funds transfers.
- Illegal use of automated teller machines.
- Unauthorized access to restricted or classified information.

In Sweden, rumors are rampant that several Soviet espionage incidents involving computers have occurred. The transcripts from these cases, however, are said to be classified because they involve military secrets.

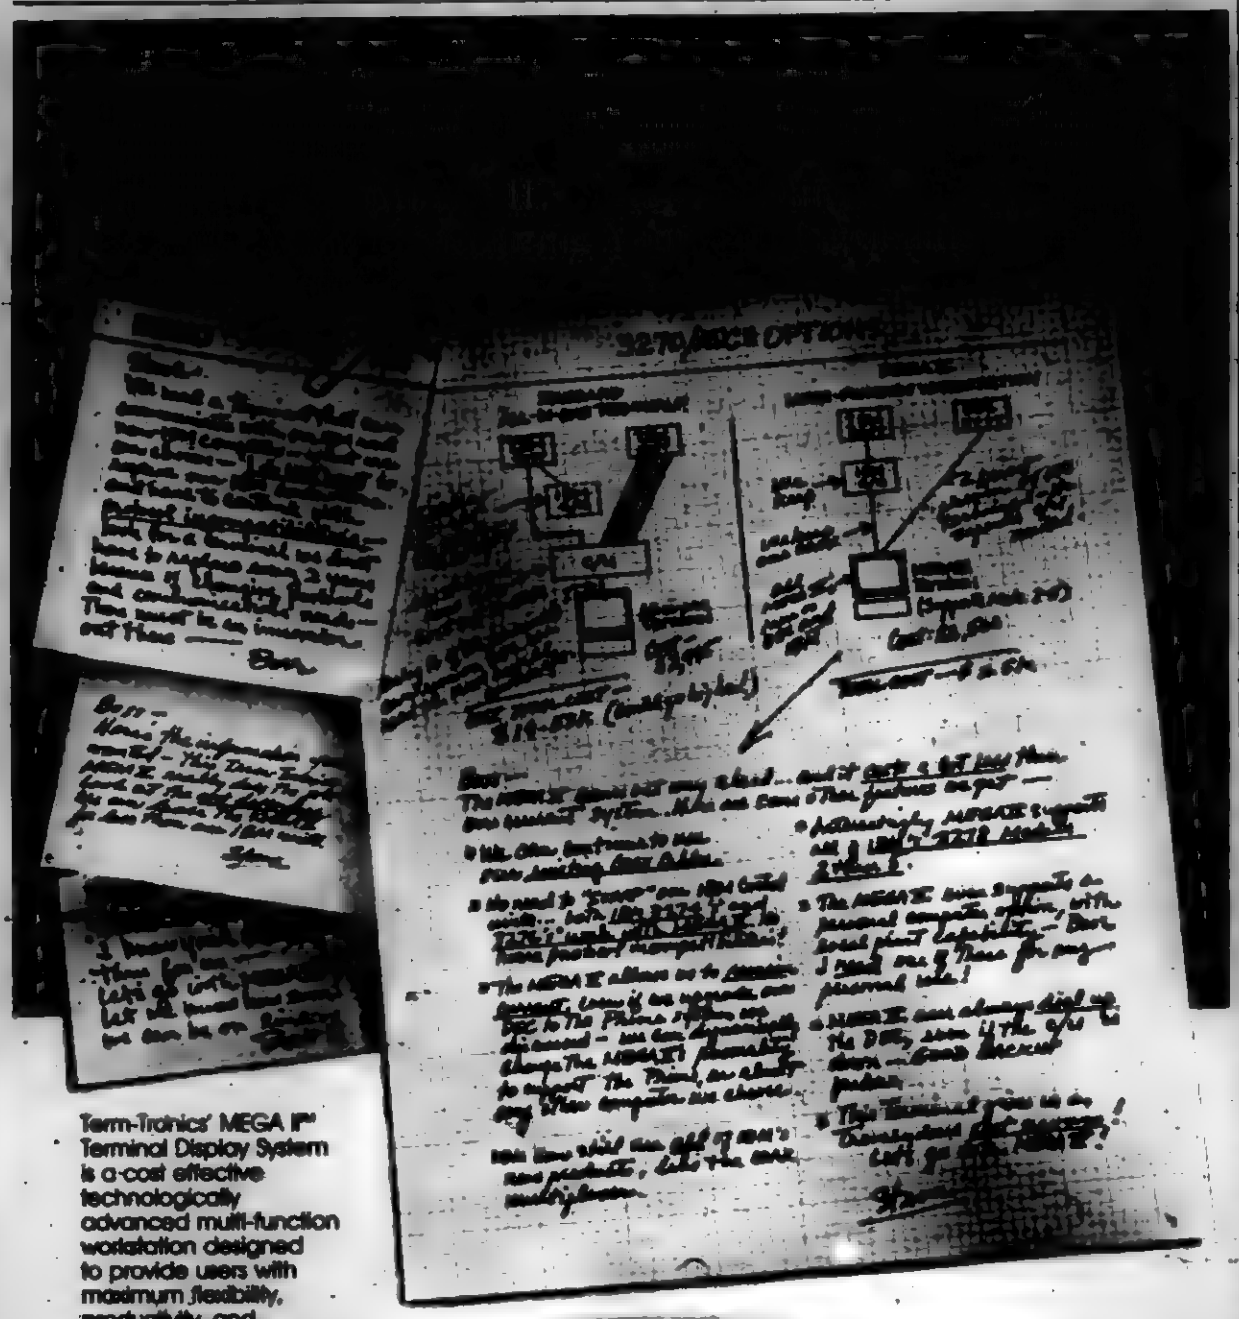
Deterrents to computer crime vary from country to country, but to a great extent they are still quite negligible. Only West Germany, for example, has a body of law that specifically addresses computer crime. Some 80 cases have gone before a court there, and depending on the nature of the crime, sentences have carried both fines and prison terms. In Japan, new laws are expected to be established within the next year to deal with this particular subject area.

In Australia, computer criminals are charged under white-collar crime legislation, and their penalties have been jail terms or fines. In other countries, general laws are applied to computer crime cases. In Sweden, for example, "ordinary crimes are committed by criminals using computers as tools," so people are tried under existing criminal laws. However, there are laws in Sweden that prohibit people from establishing personal files and forbid people to match personal data files. "This law was passed to prevent government agencies and corporations from collecting too much information about citizens," according to the survey results from Sweden.

What techniques and precautions are companies using to safeguard against computer crime? Most large companies around the world — with the exceptions of Japan and Australia, where employers appear to be more trusting — utilize tight access control with respect to their computer systems and their computer rooms. These companies also claim to have intrusion alarm systems for the computer rooms. Only a few very large companies employ guards for the computer room.

Everyone that responded to the security survey claimed that nearly all companies restrict worker access to the computer room and utilize identification codes or magnetic cards. In many countries, computer room access keys are used, although few companies strictly monitor the signing in and out of these keys. According to the recent official Japanese "Police Department White Paper," only 6.3% of the offices require use of a key and an identification code for access to their computers; and although many offices restrict handling of computer access keys, few companies keep track of these keys [CW, Nov. 7].

To protect sensitive data and preserve trade secrets, only Australians and Brazilians practice data encryption, the survey revealed. Also in Australia, compa-



nies use something called "avoidance security," a policy whereby no sensitive data can be committed to the computer's memory.

In Japan, it is generally felt that restricting access to the computer room with identification cards, restricting access to the system itself with user codes and restricting access to certain data files are sufficient precautions.

DP Criminals

Just what kind of people are involved in these wrongdoings? The "hacker" (America's subtriquet for the amateur computer prankster) is not considered a major problem in other countries.

In West Germany, the survey indicated that "90% [of computer crimes] are done by employees — the end users." This also rang true in the rest of the countries polled. Other potential criminals, in descending order of number of times mentioned, included: programmers, operators, bank employees and disgruntled employees. Japanese sources also mentioned "the titleholders in companies" as notable for being among the greatest offenders on the list of computer felons.

When asked if employers investigated people's backgrounds before hiring them, five out of seven respondents said yes, with Australia and Japan again dissenting. None of the countries polled, however, use polygraph testing during hiring; in fact, administering polygraphs is illegal in Australia and Sweden.

So what else is being done to combat computer crime? In Australia, extensive training courses are held for external auditors; special courses are conducted for fraud police; and the government has reportedly earmarked money for additional security training, the survey revealed.

In Japan, the police regularly hold conferences that address the issue of computer crime. Furthermore, 17% of all Japanese police offices are said to have implemented specific computer crime prevention

(Continued on Page 60)

Love, Money Drive International DP Crime

Love and money, not necessarily in that order, are the driving forces behind the international world of computer crime, according to a recent worldwide *Computerworld* survey on the subject.

In Sweden, for instance, three computer executives were separately seduced within the last 18 months by Soviet women and summarily coerced into giving up defense secrets and classified information. (All three eventually committed suicide.) According to Ragnar Eriksson of the National Police Headquarters in Stockholm, businessmen are extremely naive about computer espionage.

He urged employers to make greater use of psychological tests in order to predict a potential employee's psychological weaknesses.

In Japan, a 32-year-old bank clerk, at her lover's request, opened five different savings accounts under assumed names in five branch offices. She then began channeling funds into these accounts by entering "receipt of money" statements into the bank's computer system. After she accumulated over $600,000, she withdrew the money and ran away with her boyfriend. Six months later, international investigators discovered and arrested her in the Philippines.

In Australia, the sting again mixed romance with finance. An operator at the New South Wales state-run horse betting agency was changing the time clock in the computer system by three minutes. After a horse race, he would quickly telephone his girlfriend, an input clerk, with the winning horses and the amounts to put down. Authorities still don't know how much money he embezzled with this technique, but he was betrayed by his lady friend when he ditched her for another woman.

In West Germany

And in West Germany, the culprit was a programmer at a large German stock company. With the help of a program developed in-house, he fed salary information on fictitious people into his own salary account in the company's payroll system memory.

To circumvent the checkpoints in a normal payroll system, the felon developed his program to change the payments in such a way that they would never appear on any master list, nor would they generate wage slips.

This fraud was discovered by chance, and the offender was sentenced to jail for two years for illegally extorting $75,000 from his employer, sources said.

digital

COMPUTER CRIME

(Continued from Page 59)

programs.

West Germany also has specially trained police officers to investigate computer fraud cases, and additional training is presently being planned, according to the survey results.

In Sweden, the Society for Data Processing established a task force to study matters of computer security, and one task force recommendation resulted in the establishment of an international body for dealing with computer security within the cadre of the International Federation of Information Processing Societies.

In contrast, "nothing in particular" is being done to formally fight computer crime in Italy, according to the respondent, and this is also true in Brazil and France.

A number of interesting responses were elicited when *Computerworld* asked the international participants what else can and should be done to ward off future computer crime. The number one answer to this survey question, from six out of seven countries: Vendors should build more security features into their software.

Another suggested procedure, mentioned by more than half of the respondents, was tightening security in the work place. Participants in West Germany, Japan and Italy opted for harsher laws and better training programs for computer crime investigators.

The survey results from Italy stressed the importance of preventive organizational measures, such as splitting up tasks in the application development phase, tight production management in the computer room and the introduction of a security manager at every company.

In Australia, "More control is needed over people — it's really a people problem," according to Fitzgerald. His recommendations included changing people's attitudes toward computer crime.

Fifth-Generation Computing

PHOTO © 1984, GEORGE GILLON

Who's on First?

By Tom Henkel

Driven by the quest for both economic and political strength, world powers are currently staging a quiet war.

In this war, the biggest and strongest will not necessarily have an advantage over the small and weak. A single person's idea may prove the deciding factor.

In this war — the war over which nation will be first to develop the next generation of computer systems — the battlefield is the laboratory.

Computers have become so vital that today it is almost impossible to live without them. Corporations throughout the world would come to a grinding halt if they could no longer use computer systems. But perhaps the most important dependency on computer systems is for national defense.

Most world powers currently use sophisticated computer systems to design and control weapons. Without bigger and faster computer systems to build bigger and more effective weapons, some theorists contend, a world power could be rendered helpless in a few years.

It is for these reasons that thousands of researchers are working to unlock the mysteries of physics and electronics which will permit the development of new computer systems. The 1980s may be remembered as the time when computing ceased to be identified as an industry and became a political force.

The current challenge involves what has been dubbed the fifth generation of computer systems.

The U.S. and Japan are the two major players vying to be the first to develop this new class of machines. France and the United Kingdom also have ongoing government-sponsored research projects. In addition, countless researchers in other countries are working on individual projects that eventually could lead to significant developments in computing.

(Continued on Page 56)

How 3 famous names got together to

SOLVE YOUR PROBLEMS OF INTELLIGENT MICRO TO MAINFRAME CONNECTION.

Get the answers you're looking for—with the VisiAnswer™ Software System from Informatics®, the leader in mainframe to micro integration.

Informatics has teamed the best minds in the business to solve the problems of intelligent mainframe data access for microcomputer users. The VisiAnswer™ Software System is the breakthrough result of a unique team involving Informatics Corporate Micro Systems and VisiCorp™ products working with IBM® Personal Computers.

VisiAnswer™ solves the timely problems plaguing data processing professionals like you.

Available for use right now, the VisiAnswer Software System is the micro to mainframe system specifically designed to help you:

- Manage *and* control the integration of microcomputers with your current mainframe—right in *your* data processing department.
- Provide your company's micro end-users with access to specific mainframe data—without wading through unrelated information for hours.
- Maintain *security*/control of restricted portions of your corporation's data.
- Supply end-users access to *current "live" information*, instead of information that's historical and obsolete.
- Intelligently access *all* mainframe data, whether it's unique application data or part of a data base management system.

VisiAnswer™ makes your job easier and more efficient than ever.

With more and more managers and analysts in your company using desk-top computers these days, there's a tendency to improvise the way they obtain the data they need. That leaves the door wide open for mistakes and inaccurate information.

You can avoid these problems and maintain a high level of processing efficiency for everyone who needs access to that [illegible] the VisiAnswer Software System. It delivers intelligent [illegible] that makes current mainframe data available to your [illegible] in an orderly fashion. That makes their jobs *and* [illegible] accurate—something upper management [illegible]

[illegible] by the best minds in the [illegible]

[illegible] data access technology and mainframe [illegible] VisiCorp's expertise in user-friendly micro software. We chose the IBM Personal Computer for its leadership in delivering business solutions, and IBM chose us as a value-added remarketer.

This system works with *all* data bases on IBM mainframe systems. And your end-users will get data that is immediately usable with all Visi Series™ Products and other products utilizing the VisiCalc® file format.

Find out more about Informatics VisiAnswer system. Mail this coupon or call toll free today. See how VisiAnswer products can fit into your Personal Information Center as an integral part of your unique business strategy.

FIFTH-GENERATION COMPUTING

U.S., Japan View Fifth Generation Differently

The U.S. and Japan are by far the front-runners in the race to the fifth generation. In many ways, the two countries are performing the same research; the difference between them is their philosophical approaches.

Traditionally, the U.S. has operated with the philosophy that business and government should maintain a polite distance. Business' job is to turn a profit; government's job is to enforce laws and collect taxes.

As a result, U.S. corporations have historically tended to focus attention on short-term projects. In many companies, a plan aimed at boosting next quarter's profits often gets more attention than a long-range plan which may not turn a profit for 10 years.

But when it comes to research, it is difficult to put a deadline on results. Consequently, a project with potential for a significant long-term pay-back may be pushed aside in favor of other projects.

Also stifling U.S. development of a new generation of systems is the market for such systems. The biggest profits appear to come from highly popular computer systems — units which will sell in the thousands, as opposed to a handful.

Many U.S. computer companies make use of large semiconductor houses, such as Motorola, Inc. and Fairchild Industries, Inc., to supply logic chips, memories and other components such as gate arrays for their processors. For the semiconductor houses, profits come from selling current items such as microprocessors rather than from developing new technologies.

To combat this trend, the U.S. Department of Defense's Defense Advanced Research Projects Agency (Darpa) has announced plans to pump money into various universities and companies to fund artificial intelligence research projects. However, the focus of the research project must be aimed at defense rather than at commercial applications.

A Darpa spokesman estimated it would spend about $50 million by the end of 1983 on assorted artificial intelligence projects at the business and university levels. The spokesman also pointed out that while Darpa is funding defense-oriented projects, a technology developed for a defense application can often be easily adapted for use in a commercial project. Darpa intends to make the technology developed under its funding available to industry.

Some Solutions

Control Data Corp. has found a way around the problem of funding projects with long-term rather than short-term payoffs. The firm recently allowed two of its top supercomputer architects, Neil Lincoln and Lloyd Thorndyke, to form their own company, ETA Systems, Inc. (CW, Aug 22.)

According to CDC Chairman William Norris, the two started their own company with CDC's blessing because CDC could no longer budget enough money to support adequately a supercomputer research project.

Of the U.S. computer makers, only IBM, which reportedly spent $3 billion in 1983 on research and development, appears able and willing to fund the major research projects necessary to produce a new generation of processor, noted Dr. Al Brenner, head of computing at the Department of Defense's Fermi Laboratory.

The quest for a U.S.-developed fifth-generation processor has an entrepreneurial flavor. Perhaps the most publicized effort has been that of the Microelectronics Computer Corp. (MCC), a research consortium of nine high-tech companies led by the former head of the National Security Agency, (Ret. Adm.) Bobby Inman. MCC was formed through the efforts of CDC's Norris to develop a high-tech research consortium.

In addition to CDC, other members of the consortium include: Honeywell, Inc.; Micro Devices, Inc.; Mostek, Inc.; NCR Corp.; National Semiconductor Corp.; Sperry Corp.; Allied Corp.; and Rockwell International Corp. MCC recently chose Austin, Texas, for its headquarters (CW, Dec. 19).

Thinking Machines, Inc., a Waltham, Mass., group of MIT researchers, is pooling the expertise of several leading experts, including one of MIT's leading artificial intelligence researchers, Marvin Minski, to work on new technologies. Both MCC and the Thinking Machines organizations are still in the formative stages and neither, at this point, has produced concrete plans for research.

In an effort to produce a faster supercomputer, three research organizations — Los Alamos National Laboratory, Lawrence Livermore Laboratory and SRI International, Inc. — have formed the Supercomputer Project Research Experiment for Research and Development (Spread), which hopes to develop a supercomputer 1,000 times faster than currently available processors. While American scientists contend that supercomputers should not be included in mention of the fifth generation, their presence is essential for at least the design and testing of new systems. Others also contend that supercomputers will eventually become an integral part of new technology processors, performing the number-crunching segments of complex problems.

In addition, leading universities such as MIT, Stanford University and Carnegie-Mellon University are working on individual projects that may contribute significantly toward development of a fifth-generation processor.

Although U.S. research efforts are operating independently, Dr. Paul Schneck, a researcher with the Office of Naval Research in Washington, D.C., noted the fragmentation may offer the U.S. a benefit over other countries because many different avenues are being explored.

"I don't think any of us has the right answers at this point," Schneck said. He pointed out that while there is redundancy in the U.S. efforts, there is less chance the U.S. will wind up throwing all its support behind a project which in the end proves impractical.

(Continued from Page 61)

What exactly is a fifth-generation processor? Ironically, the term may not be concretely defined until someone actually makes one — perhaps 10 or 20 years from now. Currently, however, the term is being used to represent a genre of processors which exhibits significantly enhanced capabilities over currently available systems.

Dr. Al Brenner, head of computing at the U.S. Department of Defense Fermi Laboratory in Batavia, Ill., contends a fifth-generation processor is one capable of sophisticated artificial intelligence. Such a machine would execute logical, as opposed to mathematical, calculations.

However, John P. Riganati, a researcher with the U.S. National Bureau of Standards, notes the Japanese have defined the fifth generation to be a series of processors which, when available in the 1990s, may give Japan a stronger position in the electronics industry. Under that definition, a fifth-generation processor could include artificial intelligence processors or the high-speed, number-crunching processors known as supercomputers.

In contrast, American scientists seem to agree that new versions of supercomputers should not be included in the definition of fifth-generation processors. Newer versions of the supercomputers that exist today, such as those produced by Cray Research, Inc. and Control Data Corp., while they may employ vastly different technology, will function in basically the same manner and, thus, do not qualify as a new generation, the scientists say.

But researchers like Brenner admit the distinction between supercomputers and artificial intelli-

Japan's Approach to Fifth Generation

Unlike the U.S., which is taking a fragmented approach toward developing a fifth-generation processor, Japan is performing research in a highly controlled fashion.

With its Ministry of Trade and Industry (Miti) as a coordinator, Japan has focused the efforts of several government-sponsored projects, such as the Institute for New Generation Computer Technology and the Japan Information Processing Development Center, to work toward some commonly held goals. Each of the projects has a nine- to 10-year life span aimed at producing results sometime around the end of the century.

Japan's strong government control allows for focusing the research on several tracks. John P. Riganati, a researcher with the U.S. National Bureau of Standards, noted that the Japanese fifth-generation project, for example, is designed around 27 projects centering on seven major themes.

The benefit of this targeted approach is that Japan appears to have made the next generation of computer systems a national goal, uniting various forms of research and even some fierce competitors. The disadvantage, according to Paul Schneck, a researcher with the U.S. Office of Naval Research, is that tight governmental control may leave Japan with too narrow a focus.

Still relatively new, none of the Japanese research has yet produced a significant technological breakthrough. However, some Japanese members under the Miti umbrella, such as Hitachi Ltd. and NEC Information Systems, Inc., have announced supercomputers that appear to rival those produced in the U.S.

Some experts, including Schneck, contend that Japan is riding a no-lose wave. Even if it cannot meet its proposed 1990s goal for developing a new generation of processors, Japan will undoubtedly develop useful technologies as a result of the Miti-controlled research. Other observers added that Miti has already succeeded in breaking a long-standing stereotype about the Japanese — that they are masters at observing and copying the technologies of other countries, but lack the expertise to produce new technologies domestically.

Another advantage of the Miti approach is that it has made more readily available to scientists and researchers at the university level tools such as supercomputers, which are vital to developing and testing new technologies and circuit designs.

Schneck noted that relatively few U.S. researchers have ready access to supercomputers or the expertise to use them.

But the U.S. government has made an attempt to make more heretofore classified supercomputers and other resources available to researchers, he added.

gence processors can be somewhat muddied by research that makes use of both logical and mathematical processing capabilities.

Many researchers are currently working to develop huge multiprocessors which incorporate many subsystems. Some, such as John Pinkston of the National Security Agency, have gone so far as to predict that computer systems may someday occupy the space of a small city, with thousands of processors linked together. Such a processor would manage its own work load, distributing tasks to the most capable components of the system.

Three Fronts to the Battle

Although an exact definition of fifth-generation processor is lacking, research is currently being conducted on three fronts: processors capable of performing artificial intelligence functions (such as expert systems, natural languages, visual and voice recognition and computer-aided instruction); supercomputers; and multiprocessors.

Technical problems appear to plague all three technologies. Dr. Paul Schneck, who is with the Office of Naval Research in Washington, D.C., recently pointed out that designers of computer systems have exhausted the obvious methods of increasing computer processing power. "Since we began building computers 30 years ago, there has been an order of magnitude [in speed increases] every half-dozen years or so." Now, researchers are facing the possibility that computer speed cannot be increased by technological advancements alone.

Scientists will have to resort to better packaging techniques and more efficient processor designs to boost performance, Schneck said.

All this research takes time and costs a phenomenal amount of money. IBM and Bell Laboratories have each spent millions over the past 10 years researching Josephson junctions, circuits which when cooled to near absolute zero lose virtually all resistance and allow dramatically increased switching speeds. In recent months, both organizations decided the Josephson approach is not practical for commercial systems and significantly cut back research [Nov. 14, 1983].

High risk and astronomical cost have driven many other computer makers away from serious research to develop the next generation of processors. The high cost has also curtailed some university research. To solve this problem, the governments of various countries have actively begun funding research projects. Perhaps the most popular of these is Japan's Ministry of Trade and Industry, the U.S. Department of Defense's Defense Advanced Research Projects Agency and the European Strategic Program of Research in Information Technology.

Europe Still at Starting Gate

If the quest for the fifth generation of computer systems was a horse race, some observers at the track would contend that European entries are still at the starting gate.

The European Strategic Program of Research in Information Technology (Esprit) is the only major cooperative effort among European high-technology firms to share research and development efforts. Still in the formative stages, the organization appears to have identified four major areas — microelectronics, artificial intelligence, office automation and computer-assisted manufacturing — as its focus.

Like Japan's Ministry of Trade and Industry (Miti), Esprit has given itself 10 years and a budget of upward of $800 million to set new technologies in motion.

Government-Funded Projects

In addition, individual countries, principally France and the UK, have ongoing government-funded research projects which may yield technological developments that could influence fifth-generation architectures.

France's Ministry de la Defense, for example, currently has two ongoing projects. The project dubbed Marianne is a supercomputer project aimed at developing a larger vector processor; Isis is a project aimed at linking multiple minicomputers into a multiprocessing system, according to Dr. Paul Schneck, a researcher with the Office of Naval Research.

Project Marianis is a proposed project that will combine the results of the Marianne and Isis projects, possibly to form a vector multiprocessor.

UK officials are at the present time studying a recently produced government report that looks into the viability of a fifth-generation project.

Dr. Jim Howe, leader of artificial intelligence research at Scotland's University of Edinburgh, noted that his institution has several ongoing projects, which yield advances in use of the Lisp and Prolog artificial intelligence languages.

PROBLEM SOLVING SOFTWARE FOR VM

If you have—or are getting—VM, you need these products. They solve the hard problems, making your job easier and your users more productive!

MORE RELIABILITY

● ***V/SAFE*** and ***V/SNAP*** catch CP ABENDs, take a dump and then let the system go on running. You might run for a year without a real "crash!" One customer said this software "... paid for itself the first month we had it up!"

HIGHER PRODUCTIVITY, EASE OF USE

● ***V/QUICK*** cuts "trivial" response time by up to 50%. Faster editing means happier and more productive users!

● ***V/TEMP*** lets users get temporary mini-disk space FAST, with a single command and almost no I/O. Improves system performance, eases training.

NEW FUNCTION

● ***V/SPELL*** gives you an interactive spelling check function as part of XEDIT. A "must" if you do text processing with CMS. "Our users love it," said one customer.

● ***V/FIND*** lets you locate a hexadecimal or EBCDIC character string in virtual or real memory. Debuggers delight!

ACT NOW

Call or write VM Systems Group! Our products will help you make IBM's best interactive system even better. And if you aren't already getting our newsletter, *V/UPDATE*, let us know,—we'll be happy to send it to you!

ARE YOU A "VM BIGOT?"

We are. We produce ***V/UPDATE***, a monthly newsletter of hints and information about VM — and a "TRIVIA" quiz item to test your wits, as well. *V/UPDATE* is written by VMSG staff experienced with VM systems programming and installation management, and it is available FREE to those running or planning for VM.

VM Systems Group is dedicated to solving the hard problems of VM installations with technically sound, supported, software products. Our products are designed for ease of installation and use and they are available NOW, shipped the day after we get your order.

VM Systems Group

Solving the Hard VM Problems

Relational Data Base Management Systems

Pushing for Acceptance

By Paul Gillin

At Napco Industries, Inc. in Hopkins, Minn., the Information Services Department converted this year from IBM's DL/1 hierarchical data base management system (DBMS) to Applied Data Research, Inc.'s (ADR) Datacom/DB, a relational model.

Nate Gould, Napco's director of information services, was convinced that relational was the way to go because "We need to get at data in many different ways. With DL/1, we needed too many keys and indexes to get at data."

By the end of 1984, Napco's data base will fill seven IBM 3370 disk drives with an average of 15,000 to 20,000 transactions daily. And performance under Datacom/DB is at least as good as it was under DL/1, Gould said.

But the DP department at Inland Steel Co. in East Chicago, Ind., gave relational DBMS only a cursory look when it went shopping for a data base last year. "We're planning to do big things with our data base, like automated data capture from the factory floor. You can have very lengthy runtimes with relational," Jay Schwarz, Inland's data base administrator, said.

The company eventually settled on the inverted list architecture Adabas DBMS from Software AG of North America, Inc. to run on its IBM 3081 and Amdahl Corp. 470V/8 processors. "The main thing we were looking for was productivity gains," Schwarz said. "Adabas has a lot of nice features built around it, like the [Software AG] Natural language and security features. It was more functionally complete."

These contrasting examples highlight a debate that is heating up in the software industry as vendors and users show increasing interest in the improving technology of relational DBMS. While the relational architecture has been long admired for its ease-of-use features, vendors have begun to claim that the model is suitable for high-volume production applications, a claim that critics vigorously dispute.

Relational DBMS came into its own this year largely because of the endorsement of one vendor. In announcing Database 2 (DB2) and a version of its SQL for its MVS operating system last June, IBM told its largest users they could test the re-

---

Paul Gillin is senior editor/software for Computerworld.

lational waters without giving up the sanctity of their existing IBM IMS data bases. However, the computer giant was careful not to position DB2 as a replacement for IMS, but rather to position it as an adjunct containing extracted tables for use by nonprogrammers.

The year also saw the second largest data base vendor, Cullinet Software, Inc., announce IDMS/R, a relational version of its popular IDMS. Cincom Systems, Inc. followed by announcing Ultra, a relational system for Digital Equipment Corp. VAX-11 superminicomputers. These vendors joined such other systems software heavyweights as ADR and Computer Associates International, Inc. as recent converts to the relational view.

'It Really Has Arrived'

DB2 and IDMS/R were the most significant announcements to address the subject, according to observers. "There is no question" that the whole direction of data base is in relational, according to Ronald G. Ross, editor of the "Data Base Newsletter." "When you've got both IBM and its major competitor at the large end saying that relational has arrived, then it really has arrived."

But viable relational DBMS in a transaction-heavy environment is still at least five years in the future, Ross asserted. However, the pressure for more technically elegant DBMS models will come from the users rather than from DP, which marks a new trend.

"Relational DBMS was in the wraps of academia and was not well understood for years," said Bernard Plagman, president of The Plagman Group, Inc., a management consulting firm. "IBM has lifted that shroud in announcing DB2." Plagman predicted that "the primary use of relational DBMS for the early years will be as an information center product. Transaction-driven DBMS will remain traditional for years to come."

But some vendors are banking on the opposite trend. "We have been convinced that relational techniques will be much more viable in the '80s than others," said Mark Wasilko, marketing manager for CA-Universe at Computer Associates. First installed in April, Universe was Computer Associates' entry into the DBMS market. Of the more than 50 installations anticipated by the end of 1983, most are using Universe as their primary DBMS, Wasilko said.

The debate over response times "is only a small part of the issue in my book," compared with the challenge to DP control presented by microcomputers, Wasilko said. "With personal computers, users now have a new alternative to DP," Wasilko said, adding, "We're giving DP an alternative to loss of control in that they can now take advantage of their investment in the data center."

But that control may come at a price. "It's not a software problem; it's a hardware problem," said William Inmon, director of Coopers & Lybrand in Denver. "We're seeing some corporations using up mainframe after mainframe for relational processing."

Inmon said vendors are all wrong in touting relational DBMS as suitable for high-volume transactions. For example, relational

(Continued on Page 70)

What 'Relational DBMS' Means

While relational data base management systems (DBMS) became the talk of the data base industry in 1983, the definition of what the technology entails became cloudier.

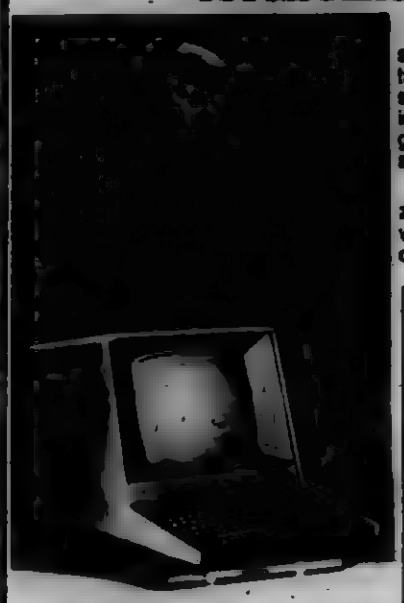
Essentially, the relational DBMS provides a logical view of data using tables with rows and columns. Data structures are defined in logical rather than in physical terms. Relations are normalized — that is, there are no dependencies within a relation. Indexes and pointers are not needed to navigate the data base.

Only three functions are theoretically required to access specific data. The Select function retrieves rows based on a stated criterion. The Project function extracts columns, or attributes, from a relation. The Join function combines relations based on specific criteria.

Relational DBMS uses a very high-level language that should insulate the user from the need to know the underlying data structures.

As summed up by Ronald G. Ross, editor of the "Data Base Newsletter," "In relational, the user is absolutely unaware that any physical construct may be necessary to support his query, which is in a purely logical structure."

Protect Your Business Machines From Unwanted Visitors With Anchor Pad.



ANCHOR PAD provides maximum security without damaging either furniture or equipment. It combines the stopping power of four separate locking and bonding devices to produce a gripping force of over 6,000 lbs. that stops thieves cold.

RELATIONAL DATA BASE MANAGEMENT SYSTEMS

(Continued from Page 69)

systems routinely scan entire data bases in response to a SELECT command, a procedure that is acceptable in batch processing, but can destroy response times when performed on-line. "As long as the relational environment has capabilities for entire data base scans, you are not going to be able to achieve the throughput for high-volume transactions."

Furthermore, Inmon questioned the desirability of letting end users access the corporate data base. "It's taken 15 years to get operational systems up to the point [where] they are today," he said. "I sure hope we don't get something that will let users run amok in the data base."

Companies experiencing these kinds of problems usually take one of two unpleasant approaches, he said. They continue to throw hardware at performance problems or clamp down on data base usage. Either approach annoys the users.

A more palatable alternative that was tried successfully by a Coopers & Lybrand client was to offer users relational functions on micros with restricted access to the corporate data base, Inmon said. Although the initial user reaction was negative, the project later proved to ease demands on processing power while offering users the access they coveted.

Most observers agree that debate over the viability of "truly relational" production data bases is becoming secondary to the emerging need for relational-like features. Unfortunately, Ross said, this has led to a war of words in which the user is the ultimate loser.

"I would rebel against any vendor who told me he had a functional relational front end if I found out the data base was unable to support relational operations fully," Ross said. "But if he could demonstrate that his DBMS engine fully supported those functions, I would readily accept him into the fold of relational vendors."

ADR's Datacom was redesigned two years ago from an inverted list architecture into a structure the company calls "relational indexed." Like relational, data is stored in tables, but the DBMS also incorporates an index that is invisible to the user.

Datacom also makes extensive use of ADR's Datadictionary facility to define data bases, control users' authorization and functions and manage high-level application development. According to Stephen Gerrard, director of marketing for data base products at ADR, the aim is to "move these products more and more into the relational camp, but only if they can be used in a high-production environment.

"Academics may not agree with our implementation as a pure relational DBMS, but our goal is to have a relational data base for production, not for academic definition," he said. Gerrard claimed that over 95% of Datacom's more than 400 users employ the DBMS in high-transaction production environments. "We have not had users complain that it's not adequate."

A notable and successful holdout from the relational tide has been Computer Corp. of America (CCA). Sales of the company's modified inverted file Model 204 DBMS are growing 100% annually, and the company has no immediate plans to enter the relational arena, according to James B. Rothnie Jr., executive vice-president.

Rothnie criticized the "cultish sort of following" that has developed around the relational concept. "I think tabular data structures are shortsighted and will not be the wave of the future," he said. "On the research side, we've seen a shift away from relational into the areas of semantic data models and functional data models, both of which are basically network architectures."

In fact, Rothnie said, basic tabular structures have ease-of-use problems that are not recognized by vendors. "If you need information that accesses more than one relation, you have to perform a join which, I think, is virtually impossible for a user to understand," he said. "Languages like SQL and [Relational Technology, Inc.'s] Quel are good for programming, but not for users, and the reason is [exemplified in] joins."

The value of relational has been its use of high-level languages that limit user control under a relational structure, but that can provide big benefits when appended onto richer architectures, he said.

What is needed to bring relational into the production environment? Many observers agree that advances in I/O technology, which balance the need of the DBMS to scan large amounts of data, could make a difference. Associative memory, in which retrieval from the storage device is done on the basis of content rather than address, is a promising technology, Plagman said. Data base machines also present an attractive — albeit expensive — alternative by relieving the mainframe of some of the access burden.

The Data Center is under your command.

But is it under your control?

Value Computing's systems management software automates the critical tasks of production forecasting and scheduling, capacity planning, and resource allocation and accounting, and brings those tasks under centralized control. Your control.

The effects on data center operations are immediate: a more stable production environment ... faster turnaround ... fewer manual procedures ... shorter night processing times ... fewer mistakes, mis- re-runs ... less management dependency on operations personnel.

In short, a smoother running, better performing data center; a center where managers get the most intensive use of all resources. Without making a major capital investment in additional CPUs or peripherals.

We don't believe there's a more cost-effective way to improve the performance of your data center or the value of its position in your company. Call us and find out why more than 1500 users agree.

Value Computing Software Systems:
OCMS—The most powerful and ...hensive production scheduling ...rol system available.
...-Charge—The industry standard in job accounting and computer billing.
VALU-LIB—An entirely new tape management system designed for today's VS environments.
SMF Express—A unique package for the management of important SMF data.

Information Centers

PHOTO © 1983, GEORGE DILLON

The Users' Report

By George Harrar

The premise and promise of the information center is simply stated: Users can solve many of their own problems when provided with proper tools and techniques.

Two years ago, the information center was an appealing concept without a track record. Today, there is a record — the experiences of the companies which installed information centers early on. Is DP's applications backlog really reduced? Can fourth-generation software bring ease of use and productivity to the end user? Is the spread of personal computers throughout the company under control?

The information center promised much. Now the promises can be matched to reality by looking at the center not as an IBM concept, but rather as an up-and-running part of several large American companies.

Chemical Bank

Some came from an engineering background, others from credit and human relations. Not one member of Chemical's 12-member Office Technology Center staff had worked in a traditional DP position. "We tried before to have DP work with users," Assistant Vice-President Cecil Toulon Jr. said, "and it just didn't work. DP has to talk the language it does every day, and users talk their own language."

According to Toulon, "You don't have to justify buying a personal computer" at the giant New York bank. "If you get a senior vice-president to sign the purchase order, you can have one. That's the main reason for developing the center — to keep personal computing under control."

Since February of last year, the Office Technology Center has operated as much more than a personal tool for users. It is no less than a front-line means to corporate automation. "If we get the people at the top involved in the technology, the next step is the people under them," Toulon said. "So far we have worked with five or six executive vice-presidents and a similar number of senior vice-presidents. Once we get personal computers into of-

(Continued on Page 73)

George Harrar, senior editor/features, is responsible for Computerworld's *weekly In Depth section.*

(Continued from Page 71)

fices, then we can connect them to office systems to create a workstation."

The Office Technology Center Toulon directs labors to create a friendly image, making sure, for instance, that the logo on the center's seminar brochures won't "make users afraid." The "Office of Technology Center News," bearing the logo, will go out to 6,000 officers and professionals in 1984. "You must sell the information center," Toulon said. "Users still aren't sure DP is their friend, that it is something they can use. For 90% of our users, this is their first real introduction to DP. So you must use [public relations] and marketing tools to sell it."

Chemical Bank diverged from IBM's Information Center concept in designing the Office Technology Center to incorporate personal computing, office systems and time-sharing.

Corning Glass Works Corp.

An employee interest survey showed that 71% of the Corning professional staff wanted personal computing or time-sharing capability. In response, the Corning information center evolved from a mainframe service to one now complemented by personal computers. The justification: Eliminate outside time-sharing and reduce system backlog. The prime purpose: allow users to access data.

In 1981, there were 200 users corporatewide, with 1,000 hour/mo connect time and 30,000 CPU second/mo on an IBM 3033. By mid-1983, the number of users had jumped to 1,200, the connect hours per month to 5,000 and the CPU seconds per month to 70,000. "The key to the information center taking off was [IBM's] ADRS," said Doug Leupen, manager of Information Services at Corning's Health and Science division in Medfield, Mass. "That spreadsheet broke down barriers because you can become productive very quickly with it."

The ADRS departmental reporting software package provided the function aspect of a successful information center. Also key has been the support and education provided by a small central staff, which currently handles 600 to 700 phone inquiries a week.

In 1981, the information center was instructed to break even within one year, and it did so. But in 1982 came the ultimate test. "The corporation was going through a period of lower earnings," Leupen said, "and break-even companywide was cut by 6%. Yet the information center actually doubled in use that year, with full chargeback. Key managers were using the information center to help them lower their costs."

Corning, a multinational manufacturer specializing in materials and basic technology, is standardized on IBM-compatible hardware. Any terminal can log on through IBM's Systems Network Architecture to the corporate IBM 3033 mainframe in Corning, N.Y. "The big effort now," Leupen said, "is to integrate the personal computer into the information center concept. We're moving toward the work center concept of one terminal on one desk to serve many uses, such as word processing and spreadsheet."

The information center has not lessened the application backlog waiting at the door of data processing. "What really happens is you don't hit the backlog," Leupen said. "If a user senses his requirement won't be addressed for a year or so, he won't make it. The information center addresses the hidden backlog that can't be measured because you never know if it is there."

The recently implemented Focus data base management system from Information Builders, Inc. is considered to have the potential to become the most productive of the fourth-generation software tools. "Via Focus," Leupen said, "users can look at information in the mainframe through a CRT or pull it down to a personal computer for analysis or for making a graph." Other software packages commonly used are Foresight, a financial planning package from United Information Services, Inc.; SAS from SAS Institute, Inc.; PGF and Peca, both from IBM; and Minitab, an on-line statistical system from Penn State University.

Denny's, Inc.

"In name, we're two years old," said Evan Wride of Denny's information center. "But we used the name improperly. In June, we restructured [the information center] properly as IBM defined it. We're treating the information center as a Big Eight accounting firm, a group of consultants."

Wride, as director of Communication and Administrative Systems, took over responsibility in June for an information center that "wasn't doing a good job in addressing new technology." In addition, he oversees Communication and Network Planning, reporting on a level with the directors of Systems Development, Computing Services and the Planning and Ac-

"dBASE II.gave us something that money can't buy."

Richard Sommers
Lead Programmer/Analyst
at a major health
maintenance organization.

"dBASE II gave us time.

"And in the research battle against breast cancer, time is an invaluable weapon.

"Our research people are not computer people. They're doctors and nurses. So I had to write a customized 'layman's' application for them *very* fast."

"My program development speed even impressed me."

"Using dBASE II, the relational database management system (DBMS) from Ashton-Tate, I was able to quickly develop a very large and sophisticated program for research data storage and analysis. The real beauty of the new program is its speed and ease of use. A simple two-word command starts the program, so data can be entered much faster. And when our researchers need to query the database, they ask their questions in English using medical terminology familiar to them, without having to deal with computerese.

"In the past few months, I've recommended dBASE II to at least four of my programming colleagues in other hospitals."

Put time on your side with dBASE II.

When you're customizing an applications program and fighting the clock at the same time, you won't find a faster, more flexible solution than dBASE II* from Ashton-Tate. We'll be glad to rush you all the details. Ashton-Tate, 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329, Ext. 217. In Colorado, (303) 799-4900. In the U.K., call (0908) 568866.

counting Staff.

"Communications has been identified as the key, the glue that will tie the division together," Wride said. Fifteen regional offices comprise the restaurant division of this billion-dollar company. Currently these offices run by telephone, telex and typewriter. The information center, which was started as a development group using Focus instead of Cobol, is taking on a project management function. Top priority is making recommendations toward automating the offices with word processing, financial planning software and on-line access to the host computer.

"We're currently looking to hire a project leader, someone with the same skills as if he were on the systems development staff," Wride said. This person will join information center experts specializing in personal computers and Focus to make a formal project management team ready to automate the regional offices. "We will probably take two months for the requirements definition, then do a pilot," Wride said. "When it's working well, we'll do it for the whole corporation."

Using the information center as a project team means that the same staff which studied the end-user environment and surveyed end-user needs remains after the project is implemented to answer end users' questions and solve their problems. In contrast to many information centers, like Denny's version gets involved in projects typically taking up to three months to complete.

Dennison Manufacturing Co.

"I haven't had to justify the information center budget, amazingly enough," John Lucas said. "I'm prepared to do it. The return is so obvious that they haven't felt it necessary." Lucas manages the center at Dennison, a paper remanufacturer (maker of stickers and labels) now getting into high-tech products such as point-of-sale terminals and labeling equipment. "We explicitly don't have charge-back. If a user is accessing the

(Continued on Page 74)

IBM's Information Center: Where It All Began

In 1973, IBM Canada in Toronto dedicated several systems analysts to go into the user community to help users write reports rather than having them march through the regular systems function. By 1974, this operation was named an "information center," an idea ready to spread across Canada and south of the border.

"Our stated goal at the beginning," said Gwen Warlow, the information center manager, "was to provide education, consultation, minimal environment support and problem resolution. We were trying to assist our users to become self-sufficient, that's always been our goal. That user self-sufficiency goal has not changed, but some of the subsets under it have. We've grown and deepened our involvement with user planning, resource management and office systems. We work with users much more, help them with any of their personal computing needs."

Two thousand regular end users are served by the information staff of 25. The user community is expected to grow to 2,700 in 1984, with the user-to-staff ratio staying about 100:1.

"We're looking at a broader user population now," Warlow said. "Initially, we had people who had learned tools and coded for themselves. Later on, there were users who were prepared to work with tools and could make extracts and reports for themselves. Now many people are using menus and program function keys only. They want things programmed for them."

Warlow's background is in marketing and administration in information systems. Her staff includes some from marketing, some from information systems and others from customer service.

"I think the information center works best under information systems," she said. "I think of information systems as neutral, not in finance, administration, marketing or customer service."

Warlow believes the information center has improved the overall quality of projects submitted to systems development because end users are more sophisticated. "Now that they know how to use the tools, they are more realistic about the system they want," she said.

"Before, they would put a request in and prepare to go through the enhancement cycle. Now they build what they want right into the original request. They count on using end-user tools. The information center has achieved that," Warlow maintained.

No other 3270 protocol converter can match all these features.

Since 1977, hundreds of companies all over the world including Bell Labs, Citicorp, ITT, Litton, Westinghouse—have used Local Data products to make IBM communications easy and inexpensive.

We believe the DataLynx™/3274 is the best price/performance 3270 protocol converter on the market.

So, before you buy any other protocol converter at any price, compare the DataLynx/3274 features first. Then decide.

- SNA/SDLC or BSC protocols supported. SNA is PU type 2.
- BSC for EBCDIC and ASCII.
- 16 bit, 8 MHZ Intel 8086-2 CPU.
- Auxiliary printer support allows each async port to have a separately addressable 3287 type printer. This feature enables dial users to combine CRT and print data over one dial-up line.
- 80 types of ASCII async display terminals can emulate IBM 3278 display stations, and ASCII async printers to emulate IBM 328X printers.
- Micro to main-frame support with our FileLynx™/3278 program for the IBM PC and PC compatibles supports terminal emulation and file transfer (upload/download).
- Hard copy KSR support with our "Paper/3278".
- Unique "paging" feature supports emulation of *all* models of the 3278 display station.
- Pseudo-transparency feature allows host application to transmit character and control codes to async terminal devices (e.g. graphics terminals, graph plotters, mini-computers, high-speed printers with down-loadable forms control units).
- "Compu" support for micro, mini and instrumentation computers as terminal devices.
- Dual host support.
- PROM cartridge for easy user upgrade of firmware.
- Powerful, friendly configurator mode, using menus to allow parameter definition for sync ports, logical units, async ports and terminal characteristics, including help utility.
- Configuration values saved in non-volatile EEPROM.
- Monitor mode displays current status of all ports and logical units.
- May be connected to a host directly (in modem eliminator mode), or via modems on a dedicated multipoint or point-to-point line (dial-up or dedicated), via RS-232C sync ports.
- Data rates to 19,200 bps (sync & async).
- Async ports may be configured for any of 15 fixed bit rates or "autobaud", with or without parity checking, and with a specified character format.
- Simple DTE/DCE change on all ports.
- Flow control on async ports may be configured for physical and/or logical signalling.
- Virtual device support enables reconnect of dial users independent of physical port.
- Security through dual level password protection.
- Emulation of standard 3278 keyboard functions is tailored for each supported terminal type.
- 25th status line emulation.
- SAS graphics support.
- Base color support.
- 3278-5 (27 x 132 character screen) support on 9 channels with memory expansion option.
- LU configurator options provide support for various screen formats and printer page widths.
- Front panel includes 33 function status indicators.
- Self-test of channels, memory and firmware integrity is performed continually in background mode assisted by a "watchdog" timer.
- UL and FCC approved.

For more information about the remarkable DataLynx/3274 protocol converter, call or write today. And ask about our 30-day free trial program.

INFORMATION CENTERS

(Continued from Page 73)

mainframe, he just pays for computer time. If he's on a micro, he just pays for consumable supplies."

Lucas came from Honeywell, Inc., bringing 12 years of experience in financial analysis, Basic programming and time-sharing. One information center specialist and one temporary staff person report to him; he reports to the manager of User Systems within Management Information Systems (MIS). The main walk-in center, which serves about 250 microcomputer users and 35 to 40 users who work with mainframe products, is located within the MIS building at company headquarters in Framingham, Mass.

The new year launches a new effort to reach Dennison end users through satellite centers. "We started this idea ourselves," Lucas said. "We were looking at ways to put micros in the end-user community in the most effective way. There was no good alternative for the person who wanted to use a micro four or five hours a day, short of coming over to us. The satellite centers are more for people who understand what they're doing, working on ongoing applications." The satellite locations enable the end user who has "graduated" from the main information center to work on his own, closer to his office.

In the information center, Lucas maintains one ground rule — no programming. "It's strictly off-the-shelf software," he said. "We think we can support most people that way. If we had to program, we couldn't support as many people. [The center] would become dedicated to a special group of people."

In the micro area, 1-2-3 by Lotus Development Corp. is "preeminent," according to Lucas. For mainframe applications, the only fourth-generation language used is Infodata Systems, Inc.'s Inquire, the data base ad hoc query package allowing remote, multiuser accessing.

The Charleston, W. Va., information center, begun in September 1980, is one of two DP centers serving this multinational chemical, metal and carbon maker.

"It originated to support CMS installation when [IBM's] CMS was brand new," Robert Hutton, senior staff analyst, said. "Now people are getting comfortable with CMS, and throughout the company people are getting fairly heavily into personal computer use. So now the information center is becoming a resource for people using personal computers, mostly the larger ones from IBM and Apple [Computer, Inc.]."

Part of the center's purpose was to lessen applications backlog. "It has helped in CMS-supported systems," Hutton said. Software provided by the information center is designed, as Hutton said, "to be used directly by the user if he is willing to invest a little time." The software includes Inquire, SAS' Sasgraph and [Isaco Graphics, Inc.'s] Telegraph.

Originally, the information center was aligned under the MIS position of applications manager. A year ago it shifted to the DP area, under supervision of the data center manager.

PCM COMMITMENT YOU CAN COUNT ON FOR GENERATIONS

For five PCM generations, Control Data has been building cost-effective, plug-compatible storage systems. This long-term commitment has paid off with increasingly effective storage systems. We were the first to introduce double-density versions of earlier models, like the 3350 disk drive. And now our commitment has paid off again.

Introducing the 33800 and 33750—two new and even more effective IBM-compatible storage systems from Control Data. Who else?

Better products, backed by outstanding service. Together they tell the story of Control Data's commitment to PCM. Today. Tomorrow. Always. For more information, call 612/553-4311.

VAX track to hardware freedom.

You know about the many portable programming benefits of UNIX™. You're also keenly aware of your company's extensive investment in VMS software. Now you can take advantage of both and be hardware independent, too. Because now there's EUNICE.

▲ Clearly, the way to go.

EUNICE provides a machine transparent medium that allows your programmers the freedom to operate in any one of three environments: VMS, UNIX, or integrated VMS/UNIX. They can switch modes at any time, depending on application. And through EUNICE, they can also take advantage of a wealth of available UNIX-based software.

EUNICE comes with the full Berkeley 4.1 BSD UNIX environment which includes the high level languages of C, FORTRAN 77, LISP, Pascal, and Franz LISP. You also get standard UNIX networking software. Plus, Source Code Control System — a powerful facility that provides a completely controlled program development and documentation environment.

▲ We keep you on track.

Wollongong is a full-service organization dedicated to the advancement of UNIX. As such, we're quickly becoming recognized as *The UNIX Authority*. We sell more UNIX-based software to the 32-bit minicomputer market than anyone else. And back it with the widest range of support services available.

Services like personalized client consultation; system-level design; fast, efficient installation; on-site training and full documentation. We also provide a wide variety of options to enhance the efficiency of your VMS/UNIX system. Options like RM/COBOL, a high-level implementation of the ANSI 74 COBOL standard for efficient execution of COBOL business applications. Or IP/TCP, the new Department of Defense protocol that allows two or more host computers to communicate within a predefined environment.

▲ Over 300 VAX sites already free!

They know the fastest track to independence lies with EUNICE. Because they've joined the growing list of satisfied Wollongong customers. To find out how you can enjoy hardware freedom, mail the coupon today, or call our toll-free number: 800-USA-UNIX. In California, call: 800-962-UNIX.

Unix And the New Contenders

PHOTO © 1983, GEORGE DELLON

By Jeffry Beeler

Among research and academic institutions, it long ago established itself as a standard and has seldom lacked for outspoken admirers willing at a moment's notice to recite its many virtues.

But in the commercial world, a host of well-documented shortcomings has kept it from realizing its full potential and has seriously slowed its acceptance by nontechnical end users.

Today, however, the picture is beginning to change. Nearly 15 years after its conception at Bell Laboratories, Inc., this long-time bit player in the international business systems drama is finally starting to emerge from obscurity and grab some of the limelight its fans consider long overdue.

Already it shows signs of becoming the preferred operating system for 16-bit personal computers and has even made modest inroads into central computing departments, where it can occasionally be found running on IBM 370s and comparable CPUs. Whether its limited successes on the business mainframe stage will continue and ultimately propel it into technological stardom and end-user acclaim is still open to debate.

As the 1983 calendar turns its last leaf and AT&T enters its first year of true deregulation, the evolution of this potentially influential software product will bear closer watching than ever before. What finally happens with it will present corporate management information systems (MIS) managers with new challenges and opportunities that will inevitably affect their ability to:

- Hire qualified programmers.
- Acquire the latest and most advanced programming languages and development tools.
- Sidestep the pitfalls of sudden hardware obsolescence while safeguarding their investment in existing software.
- Span the vast gulf separating personal computers and central mainframes.
- Keep pace with user demand for new, improved applications.

The object of all the attention and

industry speculation is, of course, AT&T's Unix, an operating system whose overall performance thus far has drawn decidedly mixed reviews, with raves in some quarters and boos in others.

Initially for Bell Only

First written in 1969 by Bell Labs scientists Ken Thompson and Dennis Ritchie, Unix was intended as a program development tool strictly for AT&T's own internal use. Then, in the early 1970s, the user audience substantially widened when Bell began making the product available to the outside world, particularly to universities and research facilities. Because its developer was then constrained from competing in the computer industry, the program was distributed to outsiders exclusively through licensing arrangements rather than being sold directly.

Since then, Unix has found its way into the hands of more than 2,200 licensees, among them some 700 institutions of higher learning, including MIT and the University of California, according to AT&T fact sheets. At the same time, the system has also continued to flourish within Bell itself, where it is currently installed on approximately 750 CPUs in 300 sites, per-

(Continued on Page 80)

IBM to Develop Its Own Unix Version

IBM will develop and support its own version of AT&T's Unix and make the operating system available across a broad range of processor models, from personal computers to host mainframes, according to industry analyst Robert Fertig.

As modified by IBM, the control program will be a "superset" of its AT&T counterpart and will "play" on the 4300 and 308X series as well as on CPUs that have yet to be announced, he predicted.

"IBM needs to support Unix because it doesn't want independent software firms to control its destiny," and because it has to interconnect otherwise incompatible hardware, the president of Greenwich, Conn.-based Enterprise Information Systems, Inc. said in a recent interview.

Fertig's remarks about the industry giant's operating systems plans put him in accord with market researcher Eileen Shrabutenas, who described Unix as one of AT&T's most important weapons in the impending computer industry showdown with IBM.

Because of its portability, Unix provides AT&T with a ready means of integrating a large corporation's existing systems organization with the hodgepodge of competing personal computers now proliferating among its end users. Such a capability for integrating dissimilar systems is currently unavailable from IBM, according to Shrabutenas, a senior analyst at Los Altos, Calif.-based Yates Ventures, Inc.

Shrabutenas also predicted that Unix will form the technological foundation for AT&T's first commercially available line of computing hardware, the initial models of which are expected to make their debut next year. Included in the anticipated equipment family will be an existing intelligent terminal that AT&T will upgrade with a Motorola, Inc. 68000 microprocessor to form the company's first Unix-based personal computer.

A second member of the predicted Unix-driven processor line will be a high-level CPU comparable in computing power to the Digital Equipment Corp. VAX-11 superminicomputer series, Shrabutenas said.

Like Unix itself, both the personal computer and the supermini were originally developed for internal AT&T use and are now being adapted for release to the outside world as the company finally enters the era of deregulation.

The advent of the first AT&T-supplied computing hardware line will significantly expand the business world's hardware options and propel AT&T into the front ranks of the computer industry. "In the past," Shrabutenas recalled, "the leading hardware vendors included IBM, DEC and [Hewlett-Packard Co.]. In the future, that select group will be joined by AT&T, which is the only company with enough clout to challenge IBM in the Fortune 1,000 environment."

The sudden entry of such a dominant new player into the equipment vendor ball game could spell big trouble for the "bunch" companies — Burroughs Corp., Sperry Corp., NCR Corp., Control Data Corp. and Honeywell, Inc. — some of which can ill afford increased competition in their traditional market niches, Shrabutenas warned.

NOW ACCESS YOUR BURROUGHS™ MAINFRAME WITH AN IBM PC™ AND GET TOTAL WORKSTATION CAPABILITIES...

Your IBM PC™ can now function as a full capacity Burroughs TD830/MT983 type terminal and even the ET2000 thanks to the INTERCOM™ series from ICC. Synchronous, asynchronous, and direct connect communications over the Burroughs poll/select network as well as advanced functions not found on any terminal are all standard with INTERCOM. Best of all, your PC still functions as a PC. You can access your word processing or spreadsheet programs in the foreground while maintaining background communications with the host.

PLUS FILE TRANSFER...

INTERCOM series allows you to share corporate data with our micro-to-mainframe file transfer connection. INTERCOM's sophisticated file transfer program automatically uploads or downloads files between the IBM PC and Burroughs mainframe. Reformat routine can even convert transferred data to LOTUS™ 1-2-3 or VISICALC™ format.

WITH INTERCOM™

ICC's commitment to innovative software and hardware products and total customer support solves tomorrows communication problems today.

UNIX AND THE NEW CONTENDERS

(Continued from Page 78)

forming hundreds of applications ranging from programming to office automation.

In the commercial world, however, efforts to spread the gospel of Unix have often met with stiff user resistance. The reason for the opposition has to do primarily with the operating system's obscure and complicated command structure — a feature well adapted to software development, but intimidating and difficult for computing novices.

To a large extent, therefore, Unix's long-term success in the commercial marketplace depends on AT&T's ability to simplify the program's user interface. Efforts to increase the software product's user-friendliness will probably rank among the firm's top Unix-related priorities during the coming year, according to John Ulett, marketing manager for Microsoft, Inc.'s Xenix operating system.

Corporate Standard?

On the question of whether large companies will ever adopt Unix as a standard, opinions diverge widely. One of the skeptics in the debate over Unix standardization is Fenwicke Holmes, president of the Santa Barbara, Calif.-based Information Academy, who retired earlier this year as information systems director for Del Monte Corp.

Holmes sees little chance for the vaunted AT&T operating system to displace the well-entrenched IBM software that has dominated corporate computing centers for years. "The world of large mainframes is an institution like the Catholic Church, and it would take an awful lot of drive to get it to change," he contended. In theory, he added, MIS departments "should be their companies' main agents for internal change." In practice, however, "they are often less adaptable to change than they should be because of their vast investment in Cobol, procedural languages and operating systems."

Other sources see Unix standardization in the mainframe realm as a distinct possibility. The benefits of converting big corporate hosts to Unix would be myriad, contends Jack Scanlon, vice-president of Western Electric's Processor and Software Systems Division.

According to Scanlon, because Unix is written almost entirely in C, it can be easily adapted to operate with many vendors' hardware. Thus, a Unix application originally written to run on Company A's processor can be quickly transported to Company B's.

For information systems directors, such portability greatly simplifies the problem of hardware selection by minimizing the potential ill effects of choosing incorrectly. With most other operating systems, "a data processing executive has to be as good a technologist as he is a manager," Scanlon said. "But if his company migrated to Unix, he

(Continued on Page 84)

CP/M, MS-DOS To Help Shape Future of Unix

Microsoft, Inc.'s MS-DOS and Digital Research, Inc.'s Concurrent CP/M are only two of the widely used microcomputer operating systems with which the Unix world will increasingly have to contend. Other software offerings that are also likely to play a role in shaping the AT&T operating system's future will include the Unix derivatives and look-alikes.

The distinction between the two classes of Unix-like operating systems lies in their source code, Eileen Skrabutenas, a senior analyst at Yates Ventures, Inc., explained. Unlike the derivatives, which use the same source code as their AT&T model, the look-alikes are based on their own proprietary programming.

Among the derivatives, which include examples such as Microsoft's Xenix operating system, one of the key trends for 1984 will be the addition of windowing capabilities, according to John Ulett, Microsoft product marketing manager.

Among the look-alikes, meanwhile, Skrabutenas foresees the development of a standard port between Unix's latest version, System V, and the microprocessors of four major chip manufacturers — Intel Corp., Motorola, Inc., National Semiconductor Corp. and Zilog, Inc. When it released System V last January, AT&T's Western Electric announced the signing of an agreement to develop versions of the modified operating system for the four semiconductor makers' processors.

The emergence of a standard System V interface will allow application software to be transported easily among the four microprocessor options and will simplify the integration of personal computers into existing mainframe environments, Skrabutenas predicted.

As players in the larger Unix world, the look-alikes are likely to be confined primarily to narrowly defined market niches, she added.

DEC PRIME
DATA GENERAL
IBM WANG
HP TANDEM
PERKIN-ELMER

RELIABLE REMOTE PRINTING WITHOUT THE COSTS

At up to 1800 LPM

BREAK YOUR REMOTE PRINTING BOTTLENECK
The Remote Line Printer System (RLPS, patent pending) *Obsoletes* all current solutions for high speed, cost effective minicomputer based remote printing! Quite simply, the RLPS "looks" like a locally attached printer to your system.

DOUBLE OR TRIPLE YOUR THROUGHPUT
The RLPS plugs into the parallel printer port and accepts data in the more *efficient* parallel mode. Combined with its advanced data compression techniques, the RLPS provides speeds up to 1800 LPM as compared to the typical 500 LPM limitation with serially attached line printers.

DATA INTEGRITY AT LOW COST
The RLPS uses modern X.25 level 2 protocol to assure data integrity and eliminate the need for costly communications hardware to detect errors.

SAVE UP TO 50% IN TRANSMISSION COSTS
The RLPS' improved throughput results in cost savings of up to 50% or more in a dial-up environment *OR* increased availability of a private wire for better system utilization.

ABSOLUTELY NO SOFTWARE COSTS
The RLPS doesn't require a communications operating system and special software handlers. Further, the RLPS eliminates the need for reprogramming; *both* local and remote users have the same version of applications software.

PLUG COMPATIBILITY AND FLEXIBILITY
For maximum versatility, the RLPS can be configured for applications in the same building as your system, cross town, cross country and even over satellite circuits! Plug compatibility with a wide range of systems including those manufactured by DEC, DATA GENERAL, HEWLETT-PACKARD, TANDEM, PRIME, WANG, HONEYWELL, and IBM is *GUARANTEED*.

DIGITAL ASSOCIATES, THE PRINTER SOURCE, is America's leading independent supplier of plug compatible line printer systems. We offer the largest selection available, savings of up to 50% off your system vendor's prices, quick delivery, nationwide service, a full line of printer controllers and communications interfaces and complete product support with a full line of ribbons and supplies.

For further information on the RLPS or plug compatible line printer systems, call our hotline, (203) 327-9210 today.

1983 was a very good year.

NCR introduced more major data processing products than any other high tech company.

NCR closes out its first century with one of its most impressive technological achievements, the NCR 9300. It's the first full 32-bit VLSI mainframe designed for business applications. The 9300 delivers the power of a mainframe at the price of a mini.

New computers for 1983 included the UNIX™-based Tower, a microprocessor with the power of traditional minicomputers. NCR also added new multiprocessors to our top-of-the-line 8600 mainframe series.

We introduced the NCR Personal Computer specifically designed for the business/professional market. It provides dual processor capabilities to enhance performance, and is the first personal computer designed with networking in mind. It can function as an offline computer, an online terminal to your mainframe, or networked with other NCR Personal Computers and other popular PCs.

We strengthened our position as the world's leading supplier of retail point-of-sale terminals by introducing a wide range of new products. Included is a terminal that looks up the prices of over 14,800 items stored in its own internal bubble memory.

Our number one position in automated bank teller machines produced the technology for self-service airline, ski lift and service station terminals. We are the leader in electronic banking networks and electronic funds transfer.

Why did NCR introduce all these high technology products in 1983? We wanted to get a good start on our second hundred years. For more information, call 1-800-CALL-NCR. In Ohio, 1-800-543-4470.

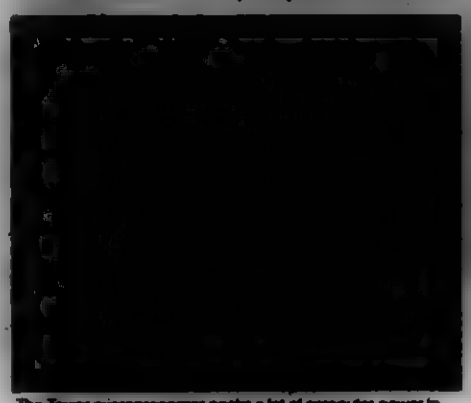
And 1984 will be even better.

NCR

1884-1984
Celebrating the future

UNIX is a trademark of Bell Laboratories.

People Express, one of America's fastest-growing airlines, chose an NCR 8600 series computer system to handle online reservations. NCR is a leader in online transaction processing equipment, communications and system software.



The Tower microprocessor packs a lot of computer power in a 29" x 27" x 7" package. Up to 16 operators, local or remote, can access the Tower at one time.

Debit cards and Electronic Funds Transfer became a reality in 1983. NCR is the leader in EFT technology today!

Bubble memory technology provides resident mass memory in the terminal for automatic price look-up for supermarkets and other retail stores.

The new NCR Personal Computer offers unsurpassed monochrome or color graphics. Industry standards are used throughout so the applications programs you need are available now.

New drive-through ATMs help the world bank on the go. NCR helped pioneer the regional electronic banking network and has installed more Automated Teller Machines worldwide than any other supplier.

The NCR 9300, a roomful of computer power in a 50-pound box, was a big breakthrough in 1983. Add this 32-bit VLSI mainframe for a complete system price of less than $48,000!

A network of Honeywell computers to improve customer service.

When Metropolitan says they stand by you—believe them.

One way to upgrade customer service is to do more to help the sales representatives responsible for that service.

So the Metropolitan Insurance Companies are installing over 1000 Honeywell DPS 6/40 small computers in their personal insurance offices throughout the U.S. and Canada.

By decentralizing computerized sales support functions, Metropolitan is giving its sales representatives instant access to data that once took days to get.

For instance, they can now obtain sales illustrations and price quotes and process service transactions just by going to a terminal.

The system also helps reps by maintaining their policyholder files and generating quality sales letters and timely reminders for client calls. What's more, Metropolitan's managers benefit by being able to measure sales against objectives more easily. The system is a strong decision support tool. Indeed, its word processing, electronic mail, and other office automation capabilities will go a long way toward speeding operations and decreasing paperwork overall.

The Metropolitan Insurance Companies chose the DPS 6/40 for its reliability, expansion capability, ease of use, and the quality of support available from Honeywell. They also liked its combination of price/performance, local processing power, and communications.

Metropolitan has always been dedicated to the best possible customer service.

We think it's a wise policy.

For more information on how Honeywell computers can help solve your problems, call 800-328-5111, Ext. 2705. (In Minnesota, call collect, 612-870-2142, Ext. 2705) or write Honeywell Inquiry Center, MS 440, 200 Smith Street, Waltham, MA 02154.

Together, we can find the answers.

Honeywell

(Continued on Page 80)

could be wrong occasionally in his hardware selection."

Portability also provides MIS heads with at least one other major payback: Because software houses will increasingly gravitate to Unix, the operating system will make available to its users a wide selection of the latest and most productive applications, Scanlon said.

Pick to End Self-Exile With Future Release

One of the computing field's least known software products may soon end its long self-exile in the industry backwaters and make a place for itself in the mainstream of commercial applications.

For years, Pick & Associates, Inc., the originators of the Pick operating system, have intentionally soft-pedaled their most cherished creation, whose many perceived shortcomings reportedly left the authors deeply dissatisfied and reluctant to seek widespread distribution. That combination of resolute perfectionism and distaste for aggressive promotion has made Pick "one of the industry's best-kept secrets," according to Janice Antonellis, a senior market analyst for International Data Corp.

Soon, however, the fog of secrecy surrounding the operating system may lift forever. An ongoing effort to rewrite Pick and, thus, rid it of its reputed drawbacks has finally begun to bear fruit in the form of a new Pick release, probably slated for introduction sometime next year, Antonellis said.

If reports of the imminent release prove true, the developers' long-delayed bid to push their products in earnest may finally be at hand, she added.

Pluses and Minuses

Whether the expected promotion succeeds and thrusts Pick into a position of unaccustomed prominence may ultimately depend on the scope and judiciousness of the rumored software rewrite. By all accounts, the control program's strengths are manifold.

Like its nearest equivalent, Unix, Pick operates with a wide array of processor models and size classes, ranging from personal computers to mainframes.

The system also boasts a large library of application software, according to Eileen Skrabutenas, a senior analyst at Yates Ventures, Inc.

Unlike Unix, however, Pick still lacks support for a high-level programming language, Skrabutenas said. In fact, the only language available with the operating system is Pick Basic.

Among small businesses, where Skrabutenas expects Pick's influence to be felt most heavily, failure to support a high-level programming language might work to a commercial operating system's advantage. But in the Fortune 1,000 world, such a handicap usually means instant rejection.

So as a future enhancement, high-level language support ranks among the leading candidates for inclusion in Pick's next release, Skrabutenas said.

Whether Pick ever finds a significant place for itself in the big-business sun also depends heavily on future directions with Unix. "If Unix finally acquires an effective user interface, Pick won't gain much momentum," a source who asked not to be identified said.

"But if Unix fails to become significantly more user friendly than it has been in the past, Pick may have a promising future," the source contended.

Normally, you might not trust a product with a new name. But while all of our products have a new name, they also have a proven history of quality and reliability.

That's because Genicom was formerly the Data Communication Products Department of General Electric. Now an independently owned company, Genicom will continue the same product line we established with GE...only the name has changed.

Our Genicom 3000 family, for instance, still offers the same performance features already preferred by users and the design flexibility so important to OEM's, distributors, retailers and dealers. Speeds from 40 to 400 cps. Single or dual mode printing. Type quality from EDP to NLQ. Multi-color printing. Graphics. Selectable type fonts. American craftsmanship and more.

Of course, we'll also offer Genicom 2000 teleprinters and the soon to be introduced 4030 shuttle matrix printers. You'll find we have the same complete product line that we had with GE. We have the same corps of experienced employees, the same facilities, and the same nationwide service network.

But above all, we have a new commitment to excellence. Which means, while we continue to serve existing customers with established products like our 3000 family, we plan to introduce more products to meet growing needs.

At Genicom, we've changed our name and we're planning to change the future with more innovations, and more of the quality you've come to expect from us under any name.

Genicom Corporation, One General Electric Drive, Dept. M321, Waynesboro, VA 22980. In Virginia, call 1-703-949-1170.

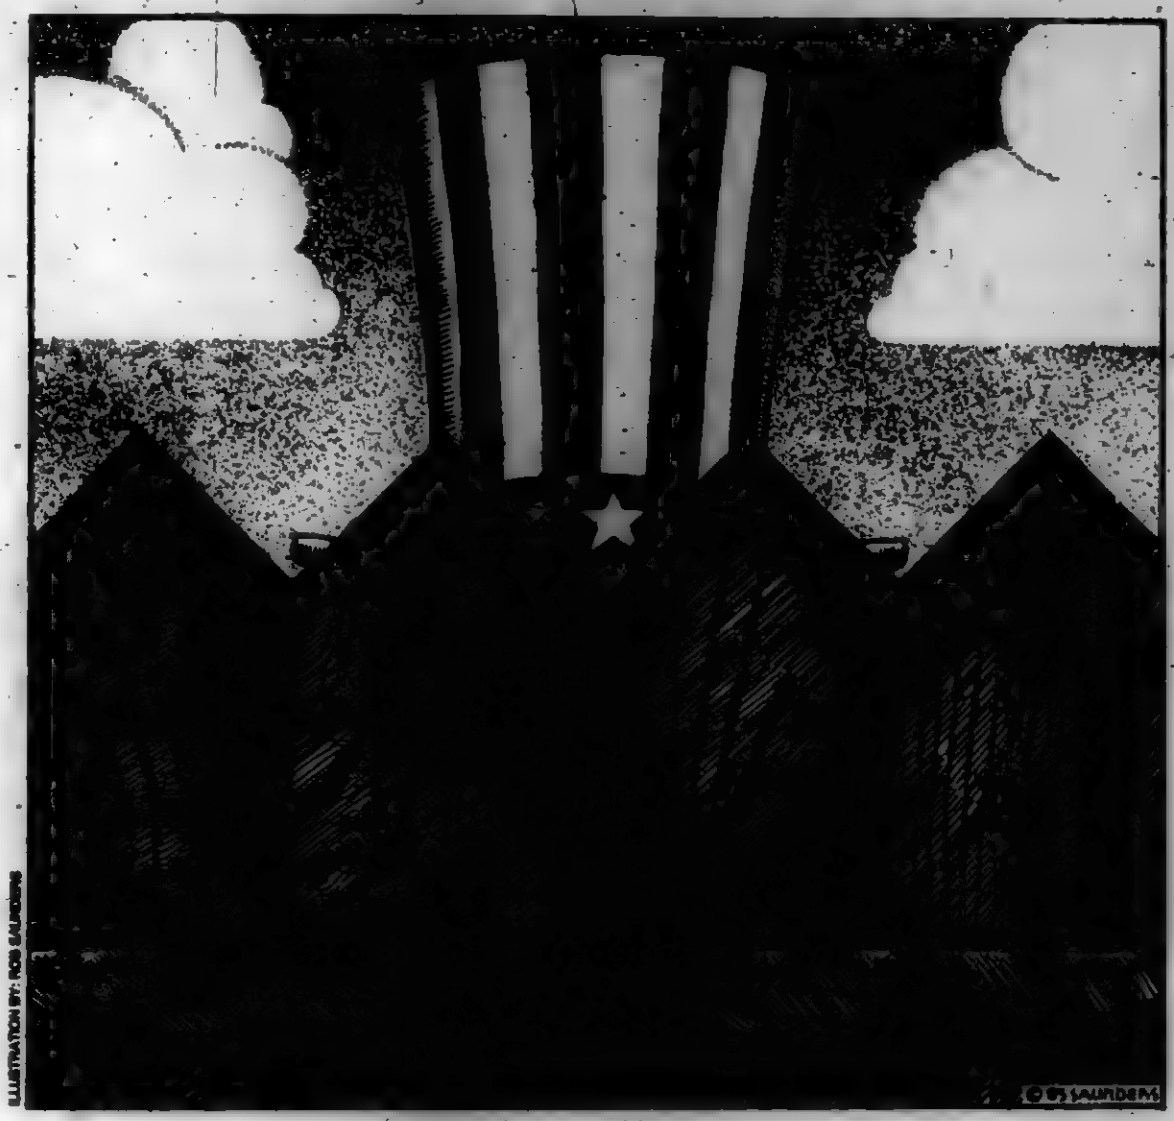
Privacy Issues In 1984



By Jake Kirchner

There was of course no way of knowing whether you were being watched at any given moment . . . You had to live — did live, from habit that became instinct — in the assumption that every sound you made was overheard, and, except in darkness, every movement scrutinized.

***— George Orwell's* 1984**

As the calendar turns to 1984, George Orwell's chilling negative utopia is much in the public consciousness. The terms "1984" and "Big Brother" are heard from every quarter, and many would have us believe that Orwell's society of complete government control and absolute lack of personal privacy is close at hand.

Actually, our society today is not at all similar to that depicted in the novel. But then Orwell's story was not a prediction, but a warning — a warning that we and our institutions are evolving in such a way that our powers of self-determination are slowly being eroded. Unfortunately, what most people think of when they hear "1984" is illustrated in the quote above; they form a mental image of Big Brother as an oppressive physical presence in the form of jackbooted, truncheon-wielding fascists relying on Peeping Tom electronics.

The Big Brother we really face is a much different beast.

In the novel, the most obvious instrument of government repression was television; every room was monitored, every action observed and every sound heard. Television is many things in our lives, not all of them beneficial. But except for scrutiny from observation cameras in some stores, public buildings and the like, most of us do not have to fear physical surveillance — at least not yet.

Computers, of course, were not well known in the late 1940s, when the novel was written. Today, many people think computers will be the primary instruments of repression. A recent Louis Harris opinion poll found that 77% of the general public and 79% of congressmen and their top aides are somewhat concerned to very concerned about threats to their privacy in the computer age. Another poll, conducted in Canada, revealed that more than half those surveyed fully expect their privacy will be invaded by computers or by government agencies and private sector organizations that use computers.

Certainly, computers make privacy invasion easy. Law enforcement agencies at every level are rapidly

(Continued on Page 86)

PRIVACY ISSUES IN 1984

(Continued from Page 85)

automating, in some cases for the purposes of surveillance. Bureaucratic and corporate organizations, not satisfied with the teeming data banks resident in their large mainframe systems, are deploying microcomputers by the tens of thousands with little or no thought to how all the personal data they process will be protected. And even the most minor financial transaction, it seems, requires one to fill out lengthy, detailed applications often demanding very personal and apparently irrelevant information — further grist for the computer mill.

But even with this trend to large-scale data gathering and lax security, the actual mechanisms of computerized privacy invasion is not well understood. Most people seem to believe it will result from too many organizations having too much information on us. While that is no doubt a legitimate concern, little thought is given to how that information will come to be in the "wrong" hands.

We fear that government and corporate America will come to take our privacy away. In fact, our privacy is already gone to a great degree and, in fact, it was not taken; to a large extent, we gave it away, all too witting accomplices of Big Brother.

We traded our privacy for government benefits, ranging from food stamps and unemployment checks to public education and income tax deductions. We bartered it for medical insurance, house mortgages, car loans, credit cards and check-cashing privileges. In many cases, we did not like giving up all the personal information, but we did not seem to have much choice.

Reflecting on this recently, one privacy advocate said: "It's always a trade-off; it's always a balance . . . The question is: Do you want to fill out this incredibly obnoxious application or do you want a credit card? Do you want to fill out this disgusting application or do you want a job . . . If you don't have a job, getting one is the most important thing."

Our concern now is that all that data might be used against us; that it will be shared by the wrong people in ways we are not aware of and would not approve of if we did know. We do not like it, but we do not know what to do about it.

Citizen Concern

Citizens are concerned about privacy, but do not know how to safeguard it. Computerized bureaucracies and corporations pay lip service to the need to protect personal privacy, but in practice are more concerned about efficiency than privacy. Legislators, whom we might expect to be concerned about our rights to privacy, are just like the rest of us — deficits, crime, nuclear proliferation and unemployment seem to be much more immediate threats.

Computerworld recently asked a number of people interested in the privacy issue to comment on "the 1984 issue" and to speculate on the causes of and possible cures for the trend toward gradual privacy erosion.

If their remarks have any common thread, it is that the American public is very much concerned about privacy, but does not know how to protect it, and that is not likely to change unless citizens and legislators make a concerted effort to win back and preserve privacy rights.

A staff member of the U.S. House of Representatives' Subcommittee on Government Information, Justice and Agriculture, which has unsuccessfully pushed privacy legislation for years, said support for privacy measures is "a mile wide and an inch deep. People are willing to trade their privacy for every other benefit."

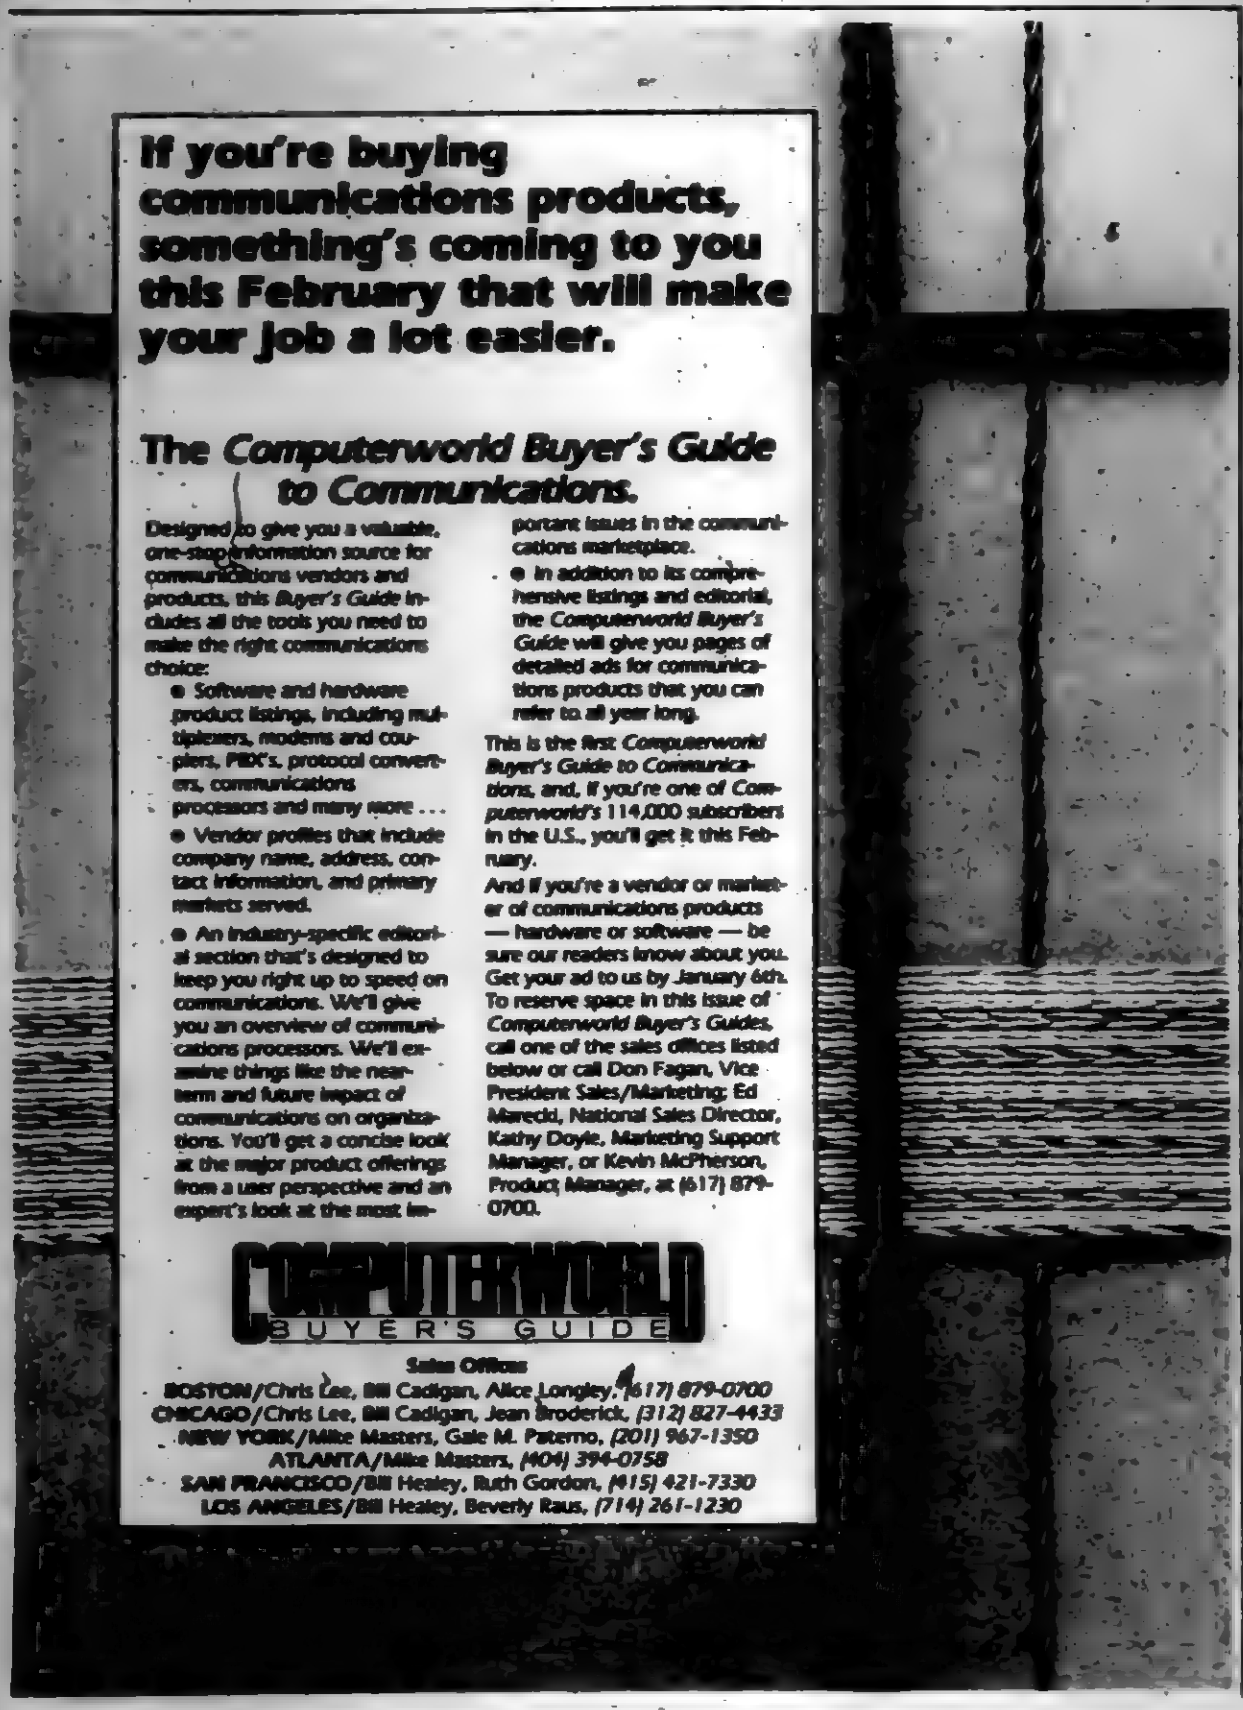
Why that is so is not immediately clear. Terril J. Steichen, director of former President Carter's Privacy Project and currently a private consultant and writer specializing in information technology topics, put it this way: "The public hates Big Brother. They like privacy but, unfortunately, they have very distorted perceptions of both."

Privacy loss, according to Steichen, results from the incremental gathering of data by many organizations plus a concomitant loss of individual control over use of that data.

Data gathering and sharing, he said, produce "data images" of citizens. Organizations make decisions about people based solely on those images, even though the data may be old, incomplete, inaccurate and biased. The person behind the data is no longer a factor.

To August Bequai, attorney and author of six books on white-collar crime and related subjects, privacy invasion is considered a sign of the times.

"Technology in and of itself doesn't mean anything," he declared. He pointed, rather, to what he sees as "a lack of sensitivity on the part of people as regards privacy . . . We've become less sensitive to the other person's rights — that's what privacy is, another person's rights."



PRIVACY ISSUES IN 1984

Federal Record Poor for Privacy Protection

With so much concern today over privacy issues, the logical question to ask is why the government is not looking out for our privacy.

Why must we fear intrusion by government agencies? After all, 1984 also marks the 10-year point for the Privacy Act, passed to ensure individual privacy protection in government operations. But today, there is more government data gathering, more data sharing and less individual control over what agencies do with our data than ever.

According to a recent congressional report, the current administration has the worst record for privacy invasion of any since the Nixon years. The report accuses the Office of Management and Budget (OMB) — responsible for overseeing agencies' privacy practices — of almost complete failure to perform its duties under the Privacy Act.

Here again, lack of understanding plays a role. Government agencies, with some exceptions, do not seem to understand why they should be zealous about protecting personal privacy. They also often confuse privacy with security and think that keeping data secure is the same thing as protecting the privacy of the data subjects.

Reluctant Citizens

OMB Deputy Director Joseph R. Wright told a congressional subcommittee a few months ago that a public perception that government data banks can be tapped from outside might make citizens reluctant to supply data to the government, "thereby eroding the integrity of our data bases and ultimately affecting the quality of our programs."

What Wright did not say is that the same thing holds true for privacy protection. If citizens feel the government is not respecting the confidentiality of personal information, if the data is freely shared by other government and private entities, agencies may encounter resistance to their data-gathering efforts. But to the government, the threat is always from the outside, never from within the organization.

Commenting on that, Terril J. Steichen, director of former President Carter's privacy project and currently a private consultant and writer specializing in information technology topics, remarked, "The fox is not going to view himself as a mad slayer of chickens. He sees himself as playing a vital role in the world. No one, including the government bureaucrat, likes to have his integrity questioned. . . . [To him] all the bad people are outside."

Beyond that, as the House Government Operations Committee report put it, "Privacy interests frequently conflict with other important governmental interests, such as economy and efficiency." According to Steichen, "Government often presents privacy as a luxury that costs government money; [privacy is] sort of silly because it requires duplication of data gathering."

It seems clear that any push to rededicate the government to privacy protection will have to come from outside the bureaucracy itself and will have to be mandated by Congress. But the chances for congressional action on privacy matters are quite slim.

The only privacy legislation now before Congress is a bill by Rep. Glenn English (D-Okla.), chairman of the House Government Information, Justice and Agriculture Subcommittee, which calls for a separate government entity to oversee privacy protection. The bill, however, is controversial even within the subcommittee, primarily because it would establish a new agency in a time when the trend is toward less bureaucracy, and according to Capitol Hill sources, the bill will be moved slowly, if at all.

The legislation "needs a tremendous amount of additional support," a subcommittee aide said. And given the Republican-controlled Senate, particularly the Judiciary Committee headed by Strom Thurmond (R-S.C.), there is almost no possibility of getting Senate approval of any but the most minor privacy legislation during 1984.

In the Senate, the most that can be hoped for is tighter privacy regulations for agencies and a mandate for greater OMB vigilance in implementing the Privacy Act. The Senate Governmental Affairs Subcommittee on Oversight of Government Management will soon continue its investigation into agency use of computer matching, particularly as it relates to Internal Revenue Service data, but a subcommittee attorney said it is not clear what if any legislation might result from this initiative.

In addition, congressional privacy advocates on both sides of Capitol Hill are fully aware that the law enforcement community, especially the Federal Bureau of Investigation, has been able to gut or kill any privacy legislation for the last five years.

Any privacy protection mechanism makes law enforcement agencies fear they will lose access to data they feel they need to do their jobs, and to a certain extent they are correct. Congress to this point has not been able or willing to make it clear that, at least in terms of privacy, police in a free society must operate under some restraints.

The blame for this state of affairs, however, should not rest solely with any one ideology; liberal legislators, too, have been negligent about privacy protection. Not only have they not faced down law enforcement, they have also been quick to advocate increased data gathering and computer matching in social welfare programs.

Evidently, in a time of tight federal budgets, programs to help the needy must be run in a climate of fear, and recipients, who in many cases are the most defenseless, must give up their privacy rights and be treated as second-class citizens in order to qualify for benefits. This holds true at least for those who, because they are at the bottom of the economic scale, must wait at the end of the government giveaway line.

Few of the more fortunate among us recognize that we receive far more in government benefits — from mortgage interest deductions, corporate tax credits and the like — than does any fatherless family on food stamps. If we do not protect the privacy rights of the least among us, who will protect ours?

The question is not academic, according to August Bequai, attorney and author of six books on white-collar crime and related subjects, who has done considerable thinking about the future of privacy and data security in the U.S. He argues that automation combined with a growing lack of ethics in this country threatens more than our privacy.

"If you have the right formula, and by that I mean the instrumentalities to gain all sorts of information and the instrumentalities to control information and a lack of ethics, and . . . if the socio-politico-economic fabric of America suffers a traumatic event or events — recession, invasion, terrorist attack — the unethical, armed with this awesome technology, can deprive us of our privacy and our political freedoms.

"We've been spared this in our country, thank God," Bequai added. But, he said, "I find it hard to believe the naivete of people who are supposedly intelligent. . . . They say, 'So what?' "

Not Without Hope

Despite the gloomy assessment of many privacy advocates, 1984 is not a year without hope. Indeed, all those contacted by *Computerworld* were uniformly optimistic that the privacy situation can change. Bequai, seemingly the most pessimistic of all, contended that education at all levels can make us more sensitive to the need to protect our privacy and that of all citizens.

The year 1984 has spawned considerable interest in privacy. George Orwell's book and the current state of society will be the topics of seminars, hearings and meetings all across the country during the coming year. Those concerned about privacy are hoping these will lead to much more grass-roots support for privacy regulations and codes of conduct in government and the private sector.

John Shattuck, head of the Washington, D.C., office of the American Civil Liberties Union, which is working with a number of public interest and professional groups to elevate the privacy issue in the public and in state and federal legislatures, said the combination of increased public access to computer technology and the Orwellian year are creating a better climate for action on privacy matters.

Shattuck said any privacy legislative agenda probably will have to wait for a change in the control of the Senate and for a new president. But he also said he does not see any presidential candidate making privacy a campaign issue. This he attributed to "overarching issues," such as the economy and foreign policy, that are crowding out privacy matters.

But, he said, "If it weren't for the fact that the world is otherwise falling apart, [privacy] might be the top item of priority." In any event, Shattuck said, privacy is an issue whose time has come.

ADDERS/Data Entry
BEATS ALL OTHER
DATA ENTRY SYSTEMS
ON SIMPLICITY, FUNCTIONALITY, AND COST

Simplicity : ADDERS/Data Entry runs on existing terminals under SHADOW II or CICS in pseudo-conversational mode. Non-D.P. staff can set up their own input screens to mirror source documents. No additional hardware needed!

Functionality : ADDERS/Data Entry offers all the function of the best key-to-disk systems plus on-line power and direct data entry.

Cost : ADDERS/Data Entry protects your resources by removing the need for specialized hardware and making optimum use of your mainframe power.

ADDERS/Data Entry is one of a group of integrated products that make common use of the ADDERS nucleus.

Call 1 (800) 556-7845 now for a free trial.
Your payback can start in just three months.

Computer Matching

PHOTO © 1988, BROOKE DILLON

An Ethical Exchange?

By John Gallant

I think there are some very distinct signs that Big Brother is around and watching. I don't mean that strictly in an Orwellian sense, but in the insidious ways computer matching has made possible. This widening exchange of information is the basis for a general surveillance system.

— John Shattuck, director of the Washington, D.C., office of the American Civil Liberties Union

Norma Rollins believes that important events — milestones, if you will — crystallize support for privacy issues.

Rollins, director of the New York Civil Liberties Union (NYCLU) Privacy Project, hopes that 1984 — in an Orwellian sense — will be the milestone that coalesces opposition to the widening use of computer matching.

"The last driving force behind a privacy issue was Watergate. The 1974 federal Privacy Act came about as a result of that," Rollins said. "Maybe 1984 will be the same for computer matching. That's a magic year. [George] Orwell's book may be just the thing to stimulate our thinking and to build a constituency once again."

Empowered by the U.S. Congress to regulate the use of computer matching on the federal level, the Office of Management and Budget (OMB) defines "computer matching" as a procedure "in which a computer is used to compare two or more automated systems of records or a system of records with a set of nonfederal records to find individuals who are common to more than one system or set." The definition is simple enough. But the benefits of computer matching, the future of efforts to limit its use and its impact on personal privacy in the heralded year of Big Brother are issues that are far from clear.

One thing, at least, is certain. The technique of computer matching will be used more often, and for a wider range of purposes, on both the state and federal levels. President Reagan has placed high priority on the eradication of fraud and inefficiency in federal benefit programs, instructing administrators to be "as mean as junkyard dogs" in their efforts to combat theft and waste. Under the Reagan administration's auspices, the technology

AVOID DOWNTIME!
WATER *ALERT*
. . . FOR COMPUTER AREAS

Warns you of water leakage in sub-floor wiring areas.

- Produces a loud, intermittent alarm when activated by presence of water.
- Completely self-contained . . . no wiring, no connections.
- Early water detection (1/64" water film activates alarm) provides maximum time for corrective action.
- 24 hour per day monitoring.
- Options include remote indicator, remote flashing light, and automatic telephone dialer.

3 Models from $59 - $110

COMPUTER MATCHING

(Continued from Page 88)

behind computer matching is constantly being refined.

"The most common problems in government programs are overpayment of benefits and erroneous payments to recipients whose assets exceed the income standards. Computer matching is simply the most efficient method to pinpoint data on assets and income and ensures that only the deserving get government benefits," said Thomas McBride, former inspector general of the U.S. Departments of Labor and Agriculture.

McBride, currently associate dean of the Stanford University Law School, also supervised the Computer Matching Project of the President's Council on Integrity and Efficiency. His former colleague on the project, U.S. Department of Health and Human Services (HHS) Inspector General Richard Kusserow, is even more adamant in his support of computer matching. Charged with protecting the department's $300 billion annual budget, Kusserow estimated that he and his staff initiate three-quarters of the matching programs undertaken by the 18 federal inspector generals.

"I hate the term 'computer matching,'" Kusserow said. "It's like a fingernail on a blackboard to my ears. This is nothing more than an automated auditing technique. It's a labor-saving technique, and if I wasn't using it, I should be fired. We're protecting the disadvantaged, the aged and the retarded. I want to be certain that only they get the benefits they're entitled to. I can't imagine anyone objecting to that. In this case, we're on the side of the angels."

Heavenly support notwithstanding, opponents of computer matching see in its widening use an increasing, dangerous impact on personal privacy. According to Ronald Plesser, former general counsel to the federal Privacy Protection Study Committee, the use of computer matching is leading to a "dangerous disintegration" of Fourth Amendment privacy rights.

"The government is pretty well committed to the use of computer matching," Plesser explained. "There have been attempts to get as much information as possible from [Internal Revenue Service] files, and they're even thinking of using census data. I would be shocked if they did that. We can expect a greater use of private information by the government also. That's troubling."

Robert Ellis Smith, publisher of the Washington, D.C.-based "Privacy Journal" newsletter, said the future promises a greater mass use of personal information, but no proportional rewards in terms of efficiency. "These programs won't do all the things they're supposed to do. Don't expect any great benefits from these techniques," he said.

Smith likened the use of computer matching to "a mass invasion of privacy," a problem that in the future will be aggravated by government's increasing reliance on private records. "The government is discovering that it doesn't even have to collect the data anymore. There are no laws limiting it from using private information," Smith said. "That means we'll have to rely on private organizations to protect our privacy rights, and if the price is right, they'll give up any information."

John Shattuck, director of the Washington, D.C., office of the American Civil Liberties Union, called computer matching "the fastest growing privacy invasion industry in government." He also criticized what he labeled the OMB's failure to regulate properly its use and a lack of congressional

Everyone In The UNIX* World Will Gather At

UniForum™

The International Conference of UNIX Users

JAN. 17-20, 1984 WASHINGTON HILTON WASHINGTON, D.C.

If you are already a part of the UNIX world . . . or want to know more about UNIX . . . UniForum is the one place you should be January 17-20, 1984.

Twenty-six conference sessions . . . all of the major UNIX vendors . . . and anyone-who-is-anyone in the UNIX community will be at the Washington Hilton for UniForum.

Begin with an all-day tutorial on Tuesday . . . hear a distinguished keynote speaker on Wednesday . . . and follow these features with informative sessions presented by /usr/group and USENIX on Wednesday, Thursday and Friday.

Exhibits will be open Tuesday, Wednesday and Thursday.

Use the registration form on this page to sign up today!

TUTORIALS

TUESDAY, JAN. 17

ALL-DAY SESSIONS – 8:30 a.m. to 5 p.m.

1. **Software Contracts & Licenses**
   Speaker: Susan H. Nycum, of Gaston, Snow, Ely Bartlett; Palo Alto, CA
2. **C Style and Portability**
   Speaker: Eric Allman, of Britton-Lee; Los Gatos, CA
3. **UNIX Systems Administration**
   Speakers: Ed Gould and Bob Kridle, of Mt. Xinu; Berkeley, CA
4. **Advanced Shell Programming**
   Speaker: Steve Bourne, of Silicon Graphics Inc.; Mountain View, CA
5. **Vi Editor**
6. **UNIX Systems on Local Area Networks**

REGISTRATION

Registration for conferences and tutorials will open in the Washington Hilton on Monday, Jan. 16 at 2 p.m.

REGISTRATION FEES (Including Exhibits):

Tutorials	$150
Students	$100
Conferences:	
Member /usr/group or USENIX	$150
Non-member	$175
Students	$100

To attend exhibits only: $10

**UNIX is a trademark of Bell Laboratories.*

/usr/ group SESSIONS

USENIX SESSIONS

WEDNESDAY, JAN. 18

7. **Keynote Address** – 9 a.m. - 10 a.m.
   Speaker: Jack M. Scanlon, Western Electric Company
8. **Joint Session** – 10:30 a.m. - Noon
9. **UNIX in Government** – 1:30 - 3 p.m.
10. **Networks** – 1:30 - 3 p.m.
11. **Market Research and UNIX** – 3:30 - 5 p.m.
12. **Distributed UNIX** – 3:30 - 5 p.m.

THURSDAY, JAN. 19

13. **Microcomputer to Mainframe Communications** – 8:30 - 10 a.m.
14. **Compilers and Languages** – 8:30 - 10 a.m.
15. **Graphics Applications on Work Stations** – 10:30 - Noon
16. **UNIX Directions** – 10:30 - Noon
17. **UNIX to Microports** – 1:30 - 3 p.m.
18. **Applications** – 1:30 - 3 p.m.
19. **/New Developments in Office Automation** – 3:30 - 5 p.m.
20. **Implementations** – 3:30 - 5 p.m.

FRIDAY, JAN. 20

21. **Case Studies in Office Automation** – 8:30 - 10 a.m.
22. **Datalinking** – 8:30 - 10 a.m.
23. **UNIX Standards** – 10:30 - Noon
24. **Open Session** – 10:30 - Noon
25. **Graphics - Computer Graphics Systems & Applications** – 1:30 - 3 p.m.
26. **Joint Session** – 3:30 - 5 p.m.

The Washington Hilton is located at 1919 Connecticut Avenue, N.W.
Regular shuttle bus service is available from both Dulles Airport and Washington National Airport to the Washington Hilton.

HOTEL: To make your hotel reservations, call toll-free 1-800-323-8186 (in Illinois and Canada, call 312-299-3131).

SHOW HOURS – Tues., Jan. 17: Noon to 7 p.m.; Wed., Jan. 18: 10 a.m. to 6 p.m.; Thurs., Jan. 19: 10 a.m. to 6 p.m.

The right application software package — does the choice get blurred?

Help is on the way from *Computerworld* this January

The ever-increasing requests for office software; the demand for tools by programmers and users alike; the bewildering array of products to choose from — make the job of selecting applications software challenging and difficult. Here's what you'll get from this January's Special Report on Applications Software to make your job easier:

- The packaged decision: Should you buy, or develop in-house?
- Methods of selecting the best application for your needs.
- Modifying and maintaining packaged applications.
- Integrating applications from multiple vendors.
- Conversion stories.
- Integrating micro with mainframe applications.
- Applications for manufacturing.

You'll get information on who should select packaged applications. You'll read about the impact of application generation tools on selecting packaged solutions. And you'll get pages of fact-filled ads for products to keep you up-to-date on just what's new. If you buy, choose or recommend applications software products — you won't want to miss this special report in *Computerworld's* January 30th issue.

And if you've got packaged software products our readers want to know about — then you need to get your ad to us by January 13 to be included in the Special Report. COMPUTER MATCHING

(Continued from Page 90)

interest and oversight — concerns shared even by some advocates of computer matching.

"It's almost a runaway train," Shattuck said. "There are virtually no restrictions on its use. The OMB has not disapproved a single use of computer matching. It's my feeling that they haven't even reviewed most of them because there is so little organized opposition to it. Until the OMB begins to exercise regulatory authority over this, there is a tacit invitation for agencies to define as legitimate all uses of computer matching."

Because the technology behind computer matching has "mushroomed," according to NYCLU's Rollins, utilization of the techniques has outstripped government policies and individual protections. Without the creation of some sort of national computer matching oversight agency, individual privacy may face extinction, Rollins said.

"A few years ago, people were up in arms about a proposed central federal data bank. But we don't need it anymore. The central data bank may not exist physically, but the way computers can now share information, it's already in place. It's time we step back and make some rational decisions. If computer matching continues on this course, it may be too late in a couple of years," Rollins said.

Those privacy concerns have even prompted some advocates to admit that legislative action is overdue. According to former Inspector General McBride, the issue of computer matching will become a major legislative topic in the next few years. "I think government officials and taxpayers have strong concerns in making efficient use of benefit programs. But there is a need to balance that with privacy concerns. I'm confident that the large majority of congressmen represent a constituency that is concerned with both."

Whether that privacy constituency will arise is far from certain. "I don't see any evidence of legislative concern," Smith said. "It's very hard for people in political life to oppose computer matching, because it's touted as cutting fraud and waste."

Plesser added, "I wish it was true. But it won't happen. I'm not convinced that anyone — with very few exceptions — is interested in computer matching in either the Senate or the House."

According to HHS' Kusserow, the future does hold promise for legislative action, but in a far different sense. "There has been a lot of improvement in the way we use computer matching. We're trying to move these techniques to the front end, to pick up exceptions before they go into the data bank. We've made the process far less intrusive, or Congress would already have taken action against it. What you will see, though, is a legislative mandate to do more computer matching, to undertake some of these state-initiated programs on the federal level."

In Kusserow's view, the future of computer matching rests on efficiency rather than privacy. During his term there, the Computer Matching Project targeted its newsletter toward program administrators, offering tips on the use of computer-matching techniques, case histories and cost/benefit analyses of the programs. Kusserow emphasized that each computer-matching project must be "tested and refined in order to reduce the number of people who are intruded upon.

"No one questions my authority to audit the records of my agency," Kusserow added. "I'm mandated by Congress to do that. Because com-

Who's sold more printers to American business?

Epson.

Actually, we've not only sold more printers to American business, we've sold more printers to America.

Which brings up some very important reasons why Epson is the printer for *your* business.

Standard equipment.
Virtually every microcomputer made is Epson-compatible. Which means manufacturers make their computers to work with our printers, because Epson printers are not only the world leaders, they're the world standard.

The reason why.
We sell more printers, because we make better printers. Our features are consistently one step ahead of the competition. Our quality and value have never been equalled. And our reliability rates are second to none.

Another reason.
Epson printers are stocked by more computer stores in more places than any other brand. Which means if you *ever* have a problem — and you probably won't — we'll be there.

Your next printer.
It can be very confusing buying a printer nowadays. But it needn't be. If you want the features, the reliability, the quality, the value, just remember one thing.

Epson.

Number one.
And built like it.

EPSON
EPSON AMERICA, INC.

COMPUTER MATCHING: AN ETHICAL EXCHANGE?

Privacy Advocates Assail 'Rogues' Gallery'

It would be difficult to find a federal department or agency that does not employ computer matching in some form. But it is individual states, most notably New York, which in many respects pioneered computer matching, initiating programs that have been or will be imitated on the national level.

During hearings on computer matching held last year by the Senate Government Management Oversight Subcommittee, the panel's chairman, Sen. William Cohen (R-Maine), estimated that federal agencies had implemented more than 85 matching programs and state agencies some 170. As far as privacy advocates are concerned, the following is a rogues' gallery of some of those computer matches:

● The Internal Revenue Service (IRS) is moving forward with its plan to begin matching its computerized files against commercially available lists of names, addresses and incomes of U.S. citizens in an attempt to identify people who fail to file tax returns. Planning to test the program early in 1984 in six of its 60 district offices, the agency is currently seeking bids for lists from private firms that estimate income from such sources as U.S. Bureau of the Census data, vehicle registration files and property assessment records. The IRS hopes the test will show the match can produce enough names of tax nonfilers to justify the costs [CW, Sept. 5, 1983].

● The Selective Service System began in 1982 to match its records against computerized Social Security Administration files for the names and addresses of American men who had failed to register for the draft. According to a spokeswoman, the agency hoped to track down the approximately 500,000 young men that Selective Service estimates did not register [CW, May 17, 1982].

Once the U.S. Departments of Defense and Transportation had reviewed the results of the match to winnow out those already serving in the U.S. Coast Guard and the military, the narrowed lists were forwarded to the IRS for another match to find current addresses for the nonregistrants. In a recent interview with Computer-

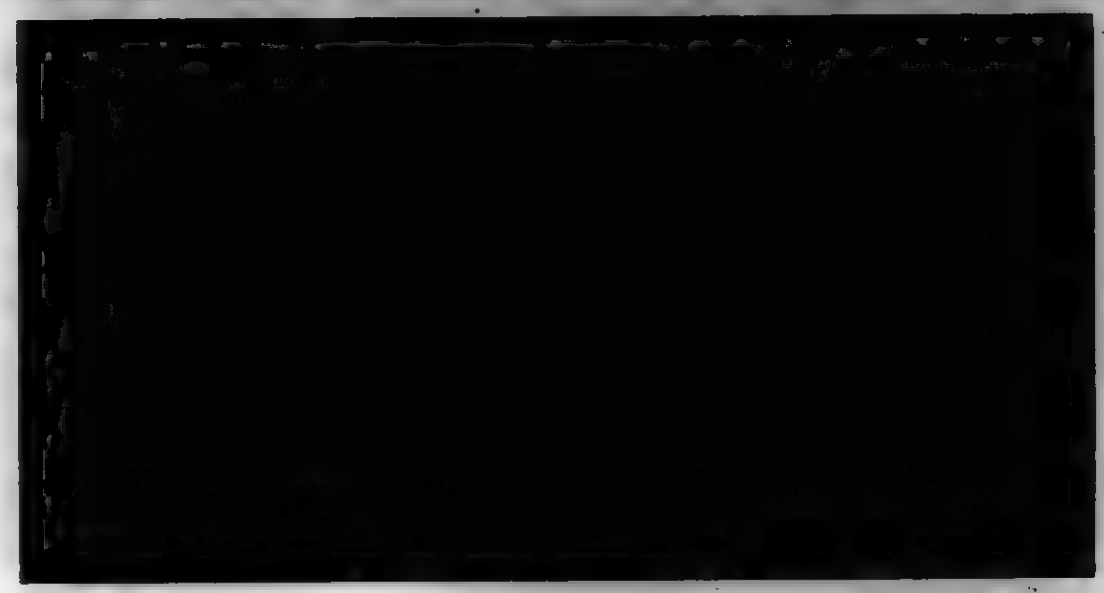
'1984' Seen Milestone

(Continued from Page 99)

puter matching only picks out exceptions, it is far more limiting than a general audit. I don't have to review 35 million records. I only need to look at the exceptions. In addition, I don't need any authorization to perform a standard audit, but I need approval for a computer match. That's added protection."

It remains to be seen whether 1984 provides the symbolic focus that crystallizes opposition to the indiscriminate use of computer matching. But Shattuck will be watching. "We are confronted with legal protections that haven't come up to date with the technology. I'm guardedly optimistic that Congress, the courts and the states will understand that they must take a hard look at this technology and its use. I'm hopeful; I can say that at least."

PRESENTING LEAR SIEGLER'S AMERICAN DREAM MACHINES: THREE NEW HIGH TOUCH™ TERMINALS.



Have you noticed that the more high technology we put into the workplace, the more human touches the workers put in? There's a real need to soften the interface between people and high technology.

That's why we designed our new High Touch™ terminals to work together with biology, not just with technology.

Our new generation of High Touch terminals brings an elegant new touch to our American Dream Machine (ADM™) tradition. The family features three new ergonomic terminals designed to meet the needs of OEMs and end users alike: The ADM 11, ADM 12 and ADM 24E.

6' coiled cable lets you put the keyboard anywhere.

There is more to ergonomics than simply tacking on a few faddish features as an afterthought. That's why we put our thinking in up front. And came up with a whole new way for terminals to relate to humans.

No aspect of terminal design escaped our deepest consideration. Or reconsideration. Dozens of little touches add up to the convenience and comfort of High Touch. For example, we put the power "on/off" switch and contrast control knob in front where they're easy to reach.

The monitor not only tilts and swivels, it stops positively in almost any position.

The clean, crisp display features a large character matrix on an easy-to-read green or amber non-glare screen—made even easier to read by the hooded bezel. Screens are available in 12" or 14" sizes.

Our uncluttered keyboard, with its logical separations between key groupings, improves your efficiency. The low-profile, DIN-standard keyboard is not only tapered, its angle of tilt is easily adjusted for maximum operator comfort.

Low profile DIN-standard keyboard with adjustable tilt.

The Selectric® layout with its sculptured keys makes data entry easy and efficient. And we placed the *control* and *escape* keys close to the alphanumeric keys, where people just naturally expect to find them.

The ADM 11 is a High Touch conversational terminal that accepts data continuously at 19.2 kilobauds. It features separate cursor control keys logically arranged in a cross for ease of use. Four modes are provided for the printer interface: page print,

COMPUTER MATCHING: AN ETHICAL EXCHANGE?

Of Agencies Employing Computer Matching

world, a spokeswoman for Selective Service said the agency has discontinued the use of Social Security data and now relies mainly on driver's license records obtained through individual contracts with state motor vehicle divisions.

● One of the most controversial of the computer matching projects to date is Massachusett's Bank Match Project. The commonwealth's Department of Public Welfare submits computer tapes bearing the Social Security numbers of all welfare recipients to more than 100 banks in an effort to snare recipients who have more money in their bank accounts than allowed by law. As of September, almost 1,200 of the 1,239 recipients whose benefits were initially terminated remained off the welfare rolls. The agency estimates that Bank Match has saved Massachusetts $6 million to date.

● Selective Service said it is only waiting input from the U.S. Department of Health and Human Services before it implements a program to compare periodically its computerized draft registration records against lists of absent fathers with child-support obligations. [CW, Oct. 24, 1983]. The Selective Service maintains information on some 11 million men between the ages of 18 and 23 who have filed with the agency since draft registration was reinstated in 1980.

● New York's Wage Reporting System is a quarterly computer match of public assistance and unemployment records against information on the reported earnings of the state's 8 million workers. State Department of Taxation and Finance wage data is compared with lists of public assistance recipients and unemployment insurance claimants submitted by the Social Services and Labor Departments. Matches are returned to those departments to be investigated.

In the Wage Reporting System's February 1982 annual report, the Commissioners of Social Services, Labor and Taxation claimed that the program had saved $23.7 million in public assistance payments and $14.5 million in unemployment insurance. Those figures were disputed by the New York Civil Liberties Union, which claimed that many of the costs of the program had not been taken into account.

● Implemented last year, the IRS' Offset Program is aimed at withholding tax returns to individuals delinquent in child-support payments. Using a consolidated list of those persons provided by the Department of Health and Human Services, the IRS runs a computer match against its master files and offsets individual tax returns by the amount of child support owed. In 1982, the IRS withheld $174 million as a result of 279,000 such offsets.

● In December 1982, the federal government announced it would begin garnishing the wages and pensions of almost 47,000 government and military employees and retirees unless they agreed to repay close to $68 million in delinquent student loans. The wage garnishment program was the result of a computer match of nearly 10 million government employee records against a list of student loan defaulters.

line print, transparent print, and display and print. There are four programmable function keys (shiftable to eight). And two levels of setup mode to reduce errors while still giving the operator maximum flexibility.

For a High Touch terminal with editing and more, choose the ADM 12. It features five non-embedded attributes. Embedded mode can also be selected for existing applications. And 16 programmable non-volatile function keys (shiftable to 32). The display memory can be configured as two 24 x 80 character pages, or one 48 x 80 page, or one 24 x 158 page. The terminal runs in either conversational or block mode.

Or choose our top-of-the-line ADM 24E which features a moveable 24-line window you can use to look at 48 (or 96) lines of memory. The ADM 24E also offers plenty of additional space for OEMs, with up to 56K ROM or RAM available for add-on programs. Plus up to 22k display RAM.

When it comes to terminal technology, we're the historic leader with the largest installed base. Our terminals are used in more computer-based systems than any other.

When you buy Lear Siegler, you're buying proven quality and reliability, backed by the broadest network of full service centers anywhere. That means you can get walk-in Express Depot™

Monitor tilts and swivels to almost any position. Available with 12 or 14 inch screen.

service, on-site service and extended warranty service in 3,000 cities nationwide.

Lear Siegler High Touch terminals are made in America—designed, engineered, manufactured and shipped from Anaheim, California to provide you with the best local support.

And that's just one more reason they're called the American Dream Machines.

ELECTION '84

Butting Heads Over Industrial Policy

By Jake Kirchner

Election year 1984 opens with campaigns for the White House and for congressional seats already in full swing. In every national election, the economy in general — and jobs in particular — is a major point of contention between the Democrats and Republicans.

This year will be no different, even with the recovery advancing on almost every front. This is primarily a legacy of the painful recession that has accompanied much of the Reagan presidency.

In 1984's campaigns, the Democrats will claim that Reagan policies have been disastrous for the working man and point to the persistent high levels of unemployment over the last several years, levels that not even the recovery has brought down any significant degree. The Republicans, on the other hand, will point with much pride and self-congratulation to the economic turnaround that began in mid-1983. They will advance the argument that all is well again with the economy, that the recession was an unfortunate, but perhaps necessary, dose of medicine to get the country on a long-term healthy track and that as the economy continues to improve, more industries will rebound and hire more people.

While the candidates mount the stump to point the economic finger of blame at their opposition, they will be mindful that the electorate may well be moved to ask what can be done to ensure that the economy will continue to grow and unemployment continue to decline. The parties' strategies for future economic vitality will be articulated under the heading "industrial policy."

Industrial policy — the general term given to various approaches to what the government should or should not do to promote new industries and protect the old, thus ensuring sufficient employment levels for future generations — will provide the nails that fix the economic plank to the parties' platforms when they are constructed at the national conventions later this year.

With that in mind, the two parties are already developing their respective industrial policies. While industrial policy has been one of the hottest topics in recent national

Jake Kirchner is a Computerworld correspondent based in Washington, D.C.

INDUSTRIAL POLICY

debate among economists, most of the practical application of various and opposing theories has centered in Congress, where the Republican and Democratic variations have already begun to emerge.

General Policy Outline

Although not all politicians have lined up behind one industrial policy approach or another, the general outline of the two parties' thinking can be summarized as follows:

Democrats believe the future economic health of the nation requires a collaboration of government, industry, labor and academia to determine the best method of future development.

Republicans believe the government should reconsider all laws, regulations and policies that have any bearing on the economy and redefine them to create an economic environment that allows industries to grow as much as possible in a generally unfettered free-market economy.

The Democrats describe their approach as a sensible, democratic means of joining all sectors of the economy to chart the most widely beneficial course for the economy. Republicans disdain that idea, scornfully referring to it as a doomed attempt to "pick winners and losers" from among today's industries through government interference, which they claim will be fraught with bureaucratic bungling and pork-barrel politics.

In the words of Treasury Secretary and Republican spokesman Donald T. Regan, the Democrats' approach is "a cure in search of a disease, a nostrum being pushed without evidence as to its efficacy for various misdiagnosed or imagined illnesses." Less diplomatic was Republican Congressman Thomas E. Petrie of Wisconsin, who said the Democrats' ideas are "perilously close to the corporate state of [Benito] Mussolini, the original model of fascism."

This is not to say there are not substantial areas of agreement between the two parties about certain "necessary" components of eco-

Both say high-technology industries — particularly computers, semiconductors, telecommunications and robotics — will be central to the U.S. economy.

Both parties say government policies, tax codes, capital investment regulations and antitrust laws must be structured to promote research and development and investment in plants and equipment. Both seek ways to increase productivity. Both would promote better math and science education and better, more wide-ranging employee job training programs to provide the workers that will be needed in future, high-tech America.

Republicans and Democrats say older industries must be encouraged and helped to modernize, that international trade must be advanced and U.S. industries must be protected from unfair foreign competition.

How, Not What

It is the question of how, not what, that divides the two parties and sets the stage for the election-year economic debate.

An outline of Democratic thinking was developed in November by the House Economic Stabilization Subcommittee of the Committee on Banking, Finance and Urban Affairs. Under the direction of subcommittee Chairman Rep. John J. LaFalce (D-N.Y.), the panel held 30 days of hearings, receiving testimony from more than 125 witnesses. The subcommittee's Democrats then produced a report, "Forging an Industrial Competitiveness Strategy" that will be the basis for industrial policy legislation in the House.

Defining what he called "key structural problems with the economy," LaFalce introduced an industrial policy legislation package, which prominently featured a provision for a Council on Industrial Competitiveness to "coordinate our existing set of industrial policies into a more effective competitive strategy." The council would be set up in the executive branch of the government and consist of high-level government officials and representatives of industry, labor, academia and public-interest groups. It would identify economic trends and problems and recommend economic strategies to the president and Congress.

The legislation also would mandate an Advanced Technology Foundation to promote applied research in the private sector. The most controversial provision in the package is a plan for a Bank for Industrial Competitiveness to channel needed capital into key U.S. industries. This would include monies for the so-called "sunrise industries" — the high-technology sector — and for older industries that must be revitalized to fend off competition from foreign firms with more modern plants and cheaper labor.

An ad hoc task force of Senate Democrats headed by Sen. Edward Kennedy (D-Mass.) shortly thereafter issued its own "Democratic Agenda" for providing future jobs, which embraced many of the same concepts, although the plan said the development bank at this point is only something that should be considered. The Senate Democrats also emphasized programs for promoting trade, worker training, education and R&D.

(Continued from Page 97)

The Republicans are not so well advanced in their industrial policy planning, but much work has been done. For example, a White House Commission on Industrial Competitiveness, headed by Hewlett-Packard Co. President John A. Young, has been looking into R&D, productivity, education, training and foreign threats to U.S. industries.

More recently, House Republicans have formed a 234-member Task Force on High-Technology Initiatives, chaired by Rep. Ed Zschau, a former computer company president and first-term representative from California's Silicon Valley area. The group has already articulated a Republican approach to industrial policy, which the task force says will be backed by legislative agenda for actions "compatible with a consistent and predictable policy of the role of government in relationship to the private sector."

This agenda "will focus on creating an environment in which high tech, new ideas and industrial growth are likely to flourish," the task force said, adding that this "climate for innovation" would include:

- A commitment to basic research.
- Incentives for risk taking by investors and entrepreneurs and an abundant supply of risk capital and a favorable regulatory climate.
- A strong educational capability, particulary in the sciences, providing a well-educated and technically trained work force.
- Expanding foreign and domestic market opportunities.

Battle Lines Drawn

So the lines of battle are drawn.

The Republicans will emphasize the economic turnaround and tout their plans to cement an economic climate that will enhance industrial competitiveness and ensure long-term economic health. A healthy economy, they will argue, will guarantee jobs and prosperity for all Americans.

The Democrats will constantly remind working Americans of the economic ills of the early 1980s. They will portray whatever final strategy they adopt as a concerted effort to ensure a more flexible and equitable economic order that will fend off any future job-killing recessions. They will promise to protect and modernize mainstream manufacturing sectors while providing the climate for explosive, industrywide high-technology growth.

The current unknown in the coming debate on the two parties' plans is, ironically, the economy.

If the recovery of 1983 turns into the boom of 1984 with drastically lowered unemployment, the industrial policy debate may well fall to the Republicans, who will claim the country should not change a successful program.

If the recovery stagnates and unemployment remains high, the Democrats will have a potent argument for their industrial policy agenda, an agenda they will portray as a major change of direction from failed Reaganomics.

Republicans' Policy

As outlined by the Republican Task Force on High Technology Initiatives, a possible Republican industrial policy might include the following:

- Increased federal funding of research carried out in universities and laboratories.
- A federal research and development project for advanced computer design.
- Federal promotion of research and development collaboration by U.S. companies, particularly through amended antitrust laws.
- Permanent tax credits for R&D.
- Tax incentives for risk capital investment.
- Tax credits and deductions for corporate contributions of cash and equipment to schools.
- An aggressive federal trade policy aimed at achieving fair and free trade.
- A government fiscal policy aimed at reducing the deficit, strengthening general economic health and encouraging personal savings and investment.

Democrats' Platform

According to Senate and House Democrats, federal actions under their industrial policy plans would include:

- An executive branch council of government, labor, business and public interest group representatives to develop a coordinated industrial policy program and encourage business, labor and government cooperation.
- Federal- and state-level centers to promote university and private-sector research and development.
- Clarified antitrust laws to encourage joint research and development in the private sector.
- Permanent tax credits for R&D.
- Improved investment in plants and equipment through federal support of state development finance agencies and consideration of a national development bank for direct federal financial support for industry.
- Education programs to include upgraded science, math and foreign language studies at all levels and vocational education programs targeted on emerging technologies and directed at disadvantaged youth, displaced homemakers and dislocated workers.
- Promotion of free international trade and government relief for industries that have been hurt by imports.
- Adjustment programs for workers and communities facing changing markets and technologies, including restructured unemployment insurance, improved training systems to help small firms and dislocated workers, community service employment for dislocated workers and adjustment assistance for companies and communities.

Election '84

The Automated Platform

By Katherine Hafner

When Tom Hayden was running for the California State Assembly in 1982, he attended countless cocktail parties where his aides made certain to collect the names and addresses of all those in attendance. Shortly after the get-together, people who had been there received a personalized letter from Hayden, "just to stay in touch" and remind them of his stand on various issues.

Hayden won the election by a 10-point margin. His Republican opponent in the race to represent the district of West Los Angeles (population 300,000) has since dropped out of sight, and Hayden's incumbency greatly increases his chances for reelection in 1984.

Hayden's office likes to attribute his sound victory to a combination of traditional grass roots campaigning, replete with sore feet and no end of hand-shaking, and a thorough exploitation of the advantage that can be gained with the use of a computer.

The Hayden campaign included personalized, albeit computer-generated, letters from Henry Fonda and Robert F. Kennedy Jr. Many of the letters were part of mass mailings, while others mentioned information gleaned from cocktail parties and opinion polls pertaining specifically to each reader.

"We generated 1.7 million pieces of direct mail," said Stephen Rivers, Hayden's administrative assistant. "Some were brochures, some were

(Continued from Page 99)

personalized letters. You determine whom you want to write to and the message you want to convey, and they are individually typed.

"Tom walked precincts every day, he met hundreds of voters and put information about their concerns into the computer for follow-up letters and phone calls," Rivera said. "Everyone he met would get input to our in-house computer and would get a personal letter."

Hayden's mode of operation is being duplicated by political candidates across the country, who are gearing up for the 1984 elections with the use of computer systems large and small, in-house or via outside direct-mail services.

Computers are being used for unprecedented precision in the identification and typecasting of voters. Census and other demographic data is used to figure out geographic areas for a candidate to concentrate on, and computers are used to gather and retain voluminous data about individual voters. Like Hayden's campaign in California, a candidate will start with a list of voters in a district, add as much information as possible about each person and then reach that person by using that information.

Heated Battle

Perhaps most heated of all is the battle between the Republican and Democratic National Committees, whose respective data processing systems generate thousands of direct-mail letters each week.

The Republican National Committee, which invested in its computer system as early as 1975, is far ahead of the Democrats with respect to the amount of computerized resources available to it. It holds a 7:1 advantage over the Democrats in the amount of direct mail it is able to generate and the number of donors and potential donors residing on the committee's data base.

The Republican National Committee also uses its system for sophisticated intracampaigning communications via internal electronic mail, automatic telephoning and ready-made press releases and proposed speeches for nonincumbents around the country.

When the Republicans first listed their donors on a Digital Equipment Corp. Decsystem 2060 with 5M bytes of memory in 1975, they started with about 25,000 names. By the 1982 election, that number had risen to 1.5 million, compared with the Democrats' base of 300,000 names residing on an IBM System/38 mainframe the committee purchased last March.

"We started a lot later than our opposiion, and we're funded at a much lower level," conceded Ed Mills, management information systems director for the Democratic National Committee. "But I think we're closing the 7:1 ratio. We won't achieve parity by 1984, but we will close the gap. It's a long process."

The use of computers in elections has increased dramatically over the past few years, affecting every aspect of the political arena. In 1984, compared with two years ago, the number of state and local candidates using microcomputers to bolster their campaign strategies is likely to triple. For less than $10,000, a candidate can maintain some 200,000 names. And the 1984 presidential election is certain to pivot around the almighty megabyte more than ever before.

While it used to be a question of how many votes a candidate could buy for his dollar, the question now is how much computing power can be purchased. For instance, for the $12 million a political action committee pumps into a direct-mail drive, only $2 million is generally made to give to candidates.

Long-Term Implications

While there is little doubt that the introduction of computers into the electoral process is changing the face of elections in America, at issue are the long-term social implications for computers in politics.

"I'm certainly aware that the strategists want to balance the scales," commented Marc Rotenberg of the Public Interest Computer Association in Washington, D.C. "But if you're taking a step back and examining computers in the political process, you have to go back to some fundamental questions.

"There have always been situations where one party has power over the other," Rotenberg said. "The question you have to ask is what the new technology brings to the circumstances. We have increasingly refined data about people's life-styles, incomes and membership associations. The level of information is carried much further than would have been possible in the past. We have begun in a sophisticated way to turn a political body into a commercial market."

A candidate's principal concern, Rotenberg said, is often with swing districts, where different types of people are examined together with pertinent factors such as their income and employment levels. If unemployment, for instance, is very high in a district, a candidate will stress new jobs.

"These things aren't new," Rotenberg said. "The question is what the computers do to that situation. The computer is a very powerful tool. For people who feel it wasn't the intention of our political system, it might be cause for concern. With technology, there's a point where a quantitative difference makes a qualitative difference.

"The extent to which computers are helping or hindering is difficult to judge," Rotenberg said. "Many politicians are more concerned with evening the game than the long-term perspective."

Behind every elaborate computer system, of course, is a lot of money — $1.5 million in the case of the Republicans and their mainframe. A hefty war chest invested in sophisticated technology can often, if not always, be a pivotal factor.

In the 1982 New York gubernatorial race between Mario Cuomo and Lew Lehrman, for instance, Lehrman spent some $6 million on his campaign. Lagging behind Cuomo in the polls, he sent letters to completely different constituents, custom-tailored to each group's different concerns. Lehrman lost the election, but his last-ditch effort helped him narrow the gap considerably.

There are other, more subtle effects that the technological age can have on the electoral process.

Apropos the connotations that *1984* has carried ever since George Orwell wrote his ominous book by that title four decades ago, computers in the next election have introduced an element of paranoia into the voting procedure itself.

"If you felt that in general your political ideas were somehow being observed and correlated, you might change your patterns and possibly even your political opinions in order not to come under the heading of subversive," warned Michael Goldhaber, director of technology projects at the Institute for Policy Studies in Washington, D.C. "So you might feel that what you did in the voting booth was an extension of that."

Along with others, Goldhaber is concerned that the relative newness of such a rapidly changing technology makes it difficult for people to understand and work with computers, thus making the possibilities for new forms of manipulation a real danger.

Big Brother

"Obviously, before computers were around, there were other means of intimidation," Goldhaber said. "But it's not so much what computers can do, but that they are sensed as Big Brother. In the voting booth, you're never quite sure how secret the ballot is at this point. Uses of all sorts of procedures and polling can alter and manipulate the public mood."

According to Christopher Arterton, an associate professor of political science at Yale University, there are positive aspects to the presence of computers in the political process. "Instruments of communications have been so blunt in the past that candidates haven't been able to talk very specifically about issues they stand for," Arterton said. "Now candidates will be much more specific about programs they stand for and will speak to issues they know audiences will be interested in. That is, they will speak in detail about x and y without necessarily having x and y be contradictory."

Said political analyst Goldhaber: "I see the great challenge is to find ways to use new technologies to promote some sort of common human feeling, to maintain the sense that we're all part of the same community at bottom. In my view, that's the heart of any effort to have a democracy."

INTRODUCING
A LOOK INTO
THE FUTURE

ESP/JSS — the new Execution Scheduling Processor. Now from Sterling Software Marketing.
Here is the most versatile time-dependent job scheduling system yet . . . NOW you can have reliable predictions of system downtime effect on job scheduling. NOW you can specify schedules using different time zones. NOW you can specify simple and complex scheduling criteria with intervals ranging from 0.01 minute to years, decades — even a century. NOW you can change initiator classes at different times during the week and activate special over-night or weekend classes automatically . . . NOW you can have all of this and more with ESP/JSS.

Third-Generation PBXs

ILLUSTRATION BY: PEDRO ROMAN

Making the Right Choice

By Katherine Hafner

As private branch exchange technology floods the marketplace, the lines between successive generations are less distinct than ever before.

Before 1975, all PBXs were considered first generation — voice-only, with manual switching via a console operator. When Rolm Corp. and Northern Telecom, Inc. introduced their digital PBX systems, the second generation came and brought about a revolution.

Although second-generation PBXs were designed to carry voice only, they have since been modified to allow for data. But enhancing a voice-only PBX to carry data proved expensive and inadequate.

Thus, in 1980, the third-generation PBX was born, along with the concept of introducing the computer into the switching system itself. Designed to carry both voice and data, third-generation PBXs feature T-1 interface capabilities, remote switching units and nonblocking architecture.

Nonblocking capabilities can be of paramount importance when installing a voice-data PBX. Because voice conversations are generally short, in a voice-only system it is usually unnecessary to include enough talking paths to accommodate each pair of ports. Third-generation PBXs are "nonblocked," meaning they can handle the traffic load when all ports are busy.

As opposed to a blocking mode, where data transmitted carries a one-in-500 chance of blocking, nonblocking architecture carries a one-in-a-million chance of blockage. In addition, nonblocking architecture handles high-speed and low-speed data, voice and video, all in a nonblocking mode at relatively low cost.

Perhaps the most distinctive characteristic of the third-generation PBX is the fact that data-switching capabilities are not retrofitted on the system.

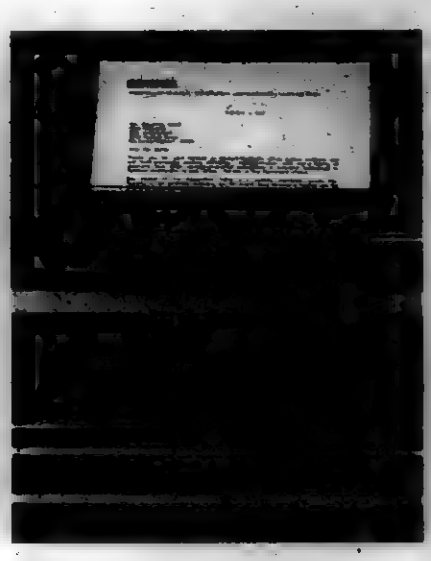
The Intera
Now it takes even less

A simple menu offers a range of options. With a few keystrokes, the user can pick an application and get straight to work.

New desk management software makes it easy for busy executives to handle electronic mail, calendar functions, filing and memos.

New three-in-one workstation combines word processing, graphics and data entry capabilities in a single terminal. It also has character sets for eleven national languages.



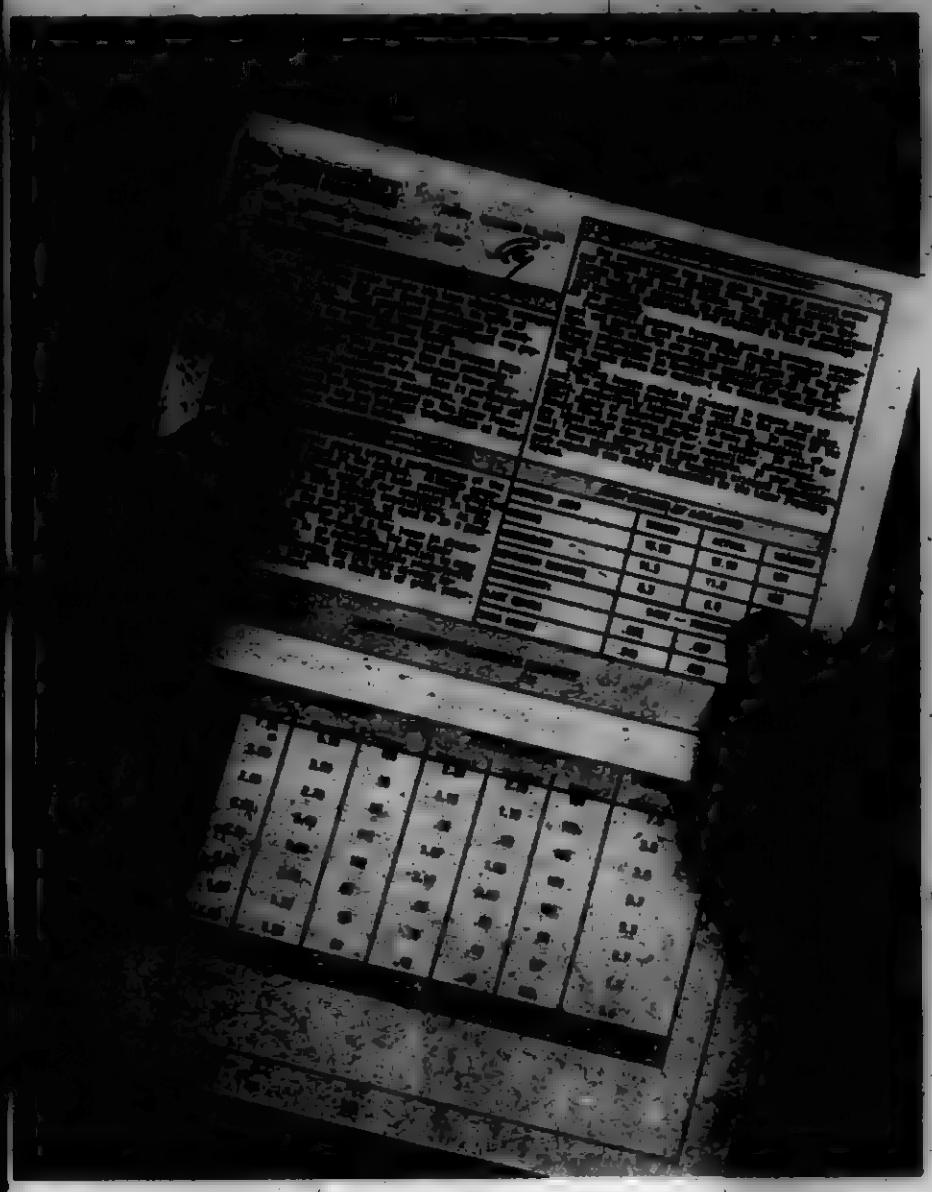
High-quality printing for business correspondence or reports is the function of this letter-quality printer.

Graphics created on this color terminal can be filed or plotted on paper or transparencies.

Innovative new touch screen control makes this manager's workstation simple to learn and to use.

An Office Systems Support Team is available for each customer, dedicated to on-site consulting, training and implementation assistance.

ctive Office.
work to do more work.



New laser printers provide fast text and grapic reproduction in quiet, low-cost, desk-top models. Up to 32 character fonts can be selected, forms stored and page sizes reduced.

Reports and summaries can be ready in a matter of minutes, using personal or company data bases. Without any programming.

Powerful, easy-to-use workstations that communicate. That's the key to increasing productivity in The Interactive Office.

Now executives can stay on top of their crowded agendas with calendar functions that help to sort priorities and avoid scheduling conflicts. With electronic mail to send memos and reports instantly around the office or the world.

We're giving managers the personal computing power they need, with connections to the company system for accessing and sharing data. And our word processors and graphics capabilities let support staffs put together impressive presentations and documents easily, even merging text and graphics.

Since The Interactive Office is built around the powerful HP 3000, data processing jobs, order entry and accounting become an integral part of the overall plan.

If you'd like to see your company do more work more easily, call your local Hewlett-Packard sales office. Or write for our brochure, "The Interactive Office," to John Metcalfe at Hewlett-Packard, Dept. 03188, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard Nederland B.V., Dept. 03188, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

We'll show you why the most productive office is an Interactive Office.

THIRD-GENERATION PBXs

(Continued from Page 101)

"That's an important consideration," commented George Colony, president of Forrester Research, Inc., a Cambridge, Mass., consulting firm. "If you're going to have 10% to 20% of your handsets attached to terminals requiring large blocks of information moving through a PBX, you'll need a fast internal matrix and a high bandwidth matrix."

Starting with Intecom, Inc. and the introduction of its IBX in 1980 [CW, July 19, 1982], third-generation PBXs have inundated the market in the past two years: AT&T with its System/85; Mitel Corp. with the SX-2000 (to be installed in the third quarter of 1984); and Siemens Communications Systems, Inc. with the Saturn II and Saturn III, to name a few.

And just as users have familiarized themselves with the various third-generation PBXs available on the market in 1983, yet another advance in technology is sneaking up on them: so-called fourth-generation PBXs.

Depending on which side of the debate you choose to tune into, a fourth-generation PBX can assume two different guises: it can be a souped-up version of a third-generation PBX and labeled fourth generation for the sake of advertising hype; or a fourth-generation PBX can be viewed as a legitimate term for a brand new product, which is local-area-network-based, with simultaneous voice and data capabilities.

Specifically, Ztel, Inc., with its Private Network Exchange (PNX) [CW, April 25, 1983] and CXC Corp. with its Rose, have announced systems that are said to combine the voice capabilities of a PBX with the short, bursty data traffic characteristic of a local-area network.

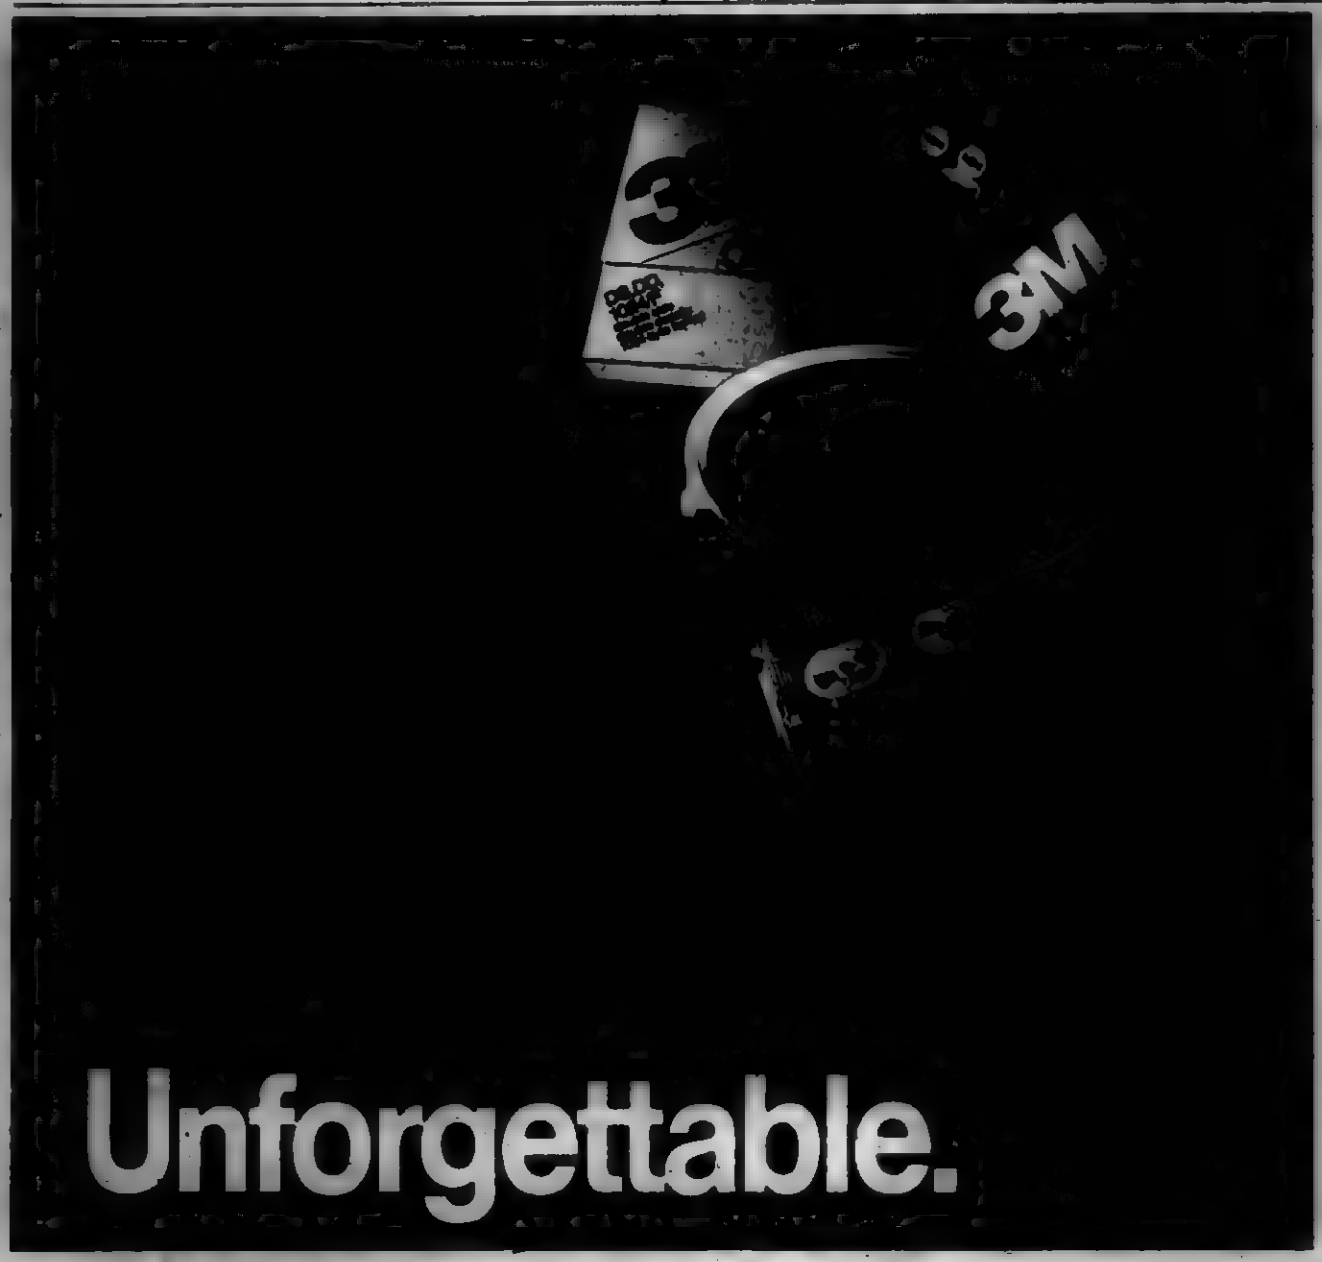
Whatever you choose to call the newest breed of PBX, it has sparked a brand new debate among communications soothsayers: Will the PBX eventually take hold as the most cost-effective and efficient method for short-haul communications, thus obviating the need for local-area networks?

Two Will Cohabit

The overriding opinion of many industry analysts is that the two technologies will cohabit.

"It appears that the industry is recognizing that the natural hub of any office will probably be a PBX," commented Alan Frost of the Eastern Management Group. "That's not saying local-area networks won't find a place. They will still be important for high data requirements and host-to-host exchange. But for routine office automation, the PBX will definitely step in."

"My feeling is the PBX will coexist with the local-area network, with the [local-area network] working as a connection for professional computers and handling the high-capacity functions, moving large documents or handling batch transfers to a nonimpact printer," Colony offered. "I suspect the IBM [local-area network] will coexist very nicely with the Rolm CBX. That will be the first elegantly planned interface between the [local-area network] and the PBX



If it's worth remembering, it's worth 3M data recording products.

3M computer media products remember everything, every time. Their reputation for reliability is backed up by something very rare in the magnetic media industry: over thirty years of manufacturing experience. That experience, plus the fact that 3M controls the entire manufacturing process, assures that the same high quality is built into every computer media product we make. So you can have complete confidence in every 3M data cartridge, diskette, and roll of computer tape you buy.

Insist on the best for all your DP needs. Insist on information processing products from 3M. Inventor of the data cartridge and the world's largest manufacturer of flexible magnetic media for the home, office and computer room.

Look in the Yellow Pages under computer supplies and parts for the 3M distributor nearest you. In Canada, write 3M Canada, Inc., London, Ontario. If it's worth remembering, it's worth 3M data recording products.

3M hears you...

3M

itself. They might even be sold together as a package."

As users remain wary of local-area networks, "mostly because of the tremendous wiring commitment," Colony said, "the user still understands that that kind of function is mandated within the company. Since the building is already wired for telephones, the first type of [local-area network] will be a PBX."

According to Colony, as the cost of communications lines diminishes between 10% and 15%, "it will be difficult for PBX vendors to make money just selling the PBX support," and future profits will lie in PBX applications.

Colony pointed to the significance of IBM's recent acquisition of 15% of Rolm in setting the pace for the future PBX market. "IBM is going to be a major new market dynamic in 1984," Colony said. "You're going to see Rolm distributing IBM products like the local-area network and personal computers. And you're going to see IBM distributing Rolm's CBX II. In fact, the Rolm CBX will perhaps become the prime market factor in 1984 because of its connection to IBM."

Strong Focus on Data

According to Colony, the major problem with next-generation PBXs is their strong focus on data. If a PBX is dedicated to data, the system's ability to handle voice can be greatly reduced, Colony cautioned.

"That's something the CXCs and Ztels have to watch out for," Colony said. "Because if you look at even 1987, in Fortune 1,000 companies with a third- or fourth-generation PBX, 75% of the capacity of the switch will still be going to plain old interactive voice. The mood is, 'Sure, give me the special features, but you've got to promise me we'll never lose a conversation.'"

For the data and telecommunications manager who has been given the responsibility for deciding which of these advanced switching systems to buy, the choices can be extremely confusing, especially when augmented with a healthy dose of marketing hyperbole and a plethora of vendors to choose from. (In 1978 there were six digital PBX manufacturers; today there are 20.)

'Shrewd Marketers'

"Systems are being sold by vendors who have solutions looking for problems," commented Edward Horrell, president of Mitchell & Horrell, Inc., a consulting firm in Memphis, Tenn.

"These guys are shrewd marketers. They all claim to have what you want: low cost, the technology, experience and delivery dates. That's all well and good, but you have to identify your specific needs. It is very important to document a three- to five-year communications plan. You must identify what you want to do and where you want to be and how you're going to get there. It sounds obvious and mundane, but it's incredibly important."

Whatever you choose to call the newest breed of PBX, it has sparked a brand new debate among communications soothsayers: Will the PBX eventually take hold as the most cost-effective and efficient method for short-haul communications, thus obviating the need for local-area networks? Many believe the two . . . will cohabit.

According to Horrell, communications managers have traditionally been perceived as "hard dollar specialists," whose purchasing decisions have been based on a comparison of fixed charges with the Bell system.

"Those days are gone now," Horrell said. "Now the [communications] manager goes in and says, 'These are our problems, these are the solutions and this is the cost. Because of that, the telecommunications industry is going to have to wake up soon in order to get up to snuff with the DP people."

"I recently had a parade of vendors come though for two-hour presentations with my client and it's always the last vendor out the door who looks the best. They all look good. The salesman makes them all look good," said James Morgan, principal at J. H. Morgan Consultants in Morristown, N.J.

Morgan suggests that companies in the market for a PBX designate a team of people for evaluating the products.

"In the past, when it was plain old telephone service, the telecommunications manager made the decision.

"The strong trend today is for a variety of people to make the decision. The team should consist of the telecommunications manager, the DP manager, the OA manager and the purchasing manager."

COMMUNICATION NETWORKS '84 offers you 100 solutions to your post-divestiture telecommunication problems.

As telecommunications and data processing managers, your success depends on keeping up to date with changing technologies. At COMMUNICATION NETWORKS you can choose from 100 information-packed sessions designed to help you succeed.

You'll learn how to survive the transition into the competitive telecommunications environment resulting from the AT&T divestiture. You'll discover new applications in Local Networks, Satellite, Bypass/DTS, Public and Private Data Networks, Interconnection, Micro Networking and new management technologies.

COMMUNICATION NETWORKS gives you twelve sessions focusing on "Network Technologies." Thursday, February 2, is "Microcomputer Networking Day," a full day devoted to teaching you how to get more from your PC than just stand-alone applications.

You may even choose to develop specific skills in one of the nine full-day "In-Depth" seminars. "In-Depth" seminars will be held on January 30, one day prior to the official opening of COMMUNICATION NETWORKS.

In just five years, COMMUNICATION NETWORKS has become the leading professional communications conference and exhibit in the nation. And COMMUNICATION NETWORKS '84 promises to be even better than ever—more sessions, more speakers, more exhibitors including American Satellite Co., AT&T Information Systems, COMSAT, Digital Equipment Corp., General DataComm Ind., General Electric Co., Integrated Communication Systems, General Electric Co., Microwave Link Operation, GTE Business Communications Systems, GTE Sprint Communications Corp., Harris Corp., DTS Div., Hewlett-Packard, M/A-COM, Mohawk Data Sciences, Northern Telecom, Inc., Scientific-Atlanta, Inc., Siecor Corp., 3M Business Communication Products, Ungermann-Bass, Inc., Usinet, United Technologies Communications Co. and many more offering the latest in products and services.

The DEC Rainbow 100+ The Rainbow 100+ system will feature 8088A and 8088 microprocessors, a 10 MB Winchester hard disk, a dual floppy diskette with 800 KB capacity and synchronous communications, built-in terminal emulator, printer port and 128 KB of system memory.

As an added plus for CN '84 attendees . . . you'll have a chance to win a DEC Rainbow 100+ Computer System.

COMMUNICATION NETWORKS '84, will take place at the Washington Convention Center in Washington, D.C., the telecomm capitol. It will be held on January 31 - February 2, 1984.

Call toll-free 800-225-4698 (in MA, 617-879-0700) for more information. Or fill out and return the coupon below.

Great Expectations

The American spirit took a beating in 1983. American lives were lost in the Middle East. Conflict and controversy raged in Central America. Tensions between the U.S. and the Soviet Union escalated dangerously. Even American relations with some of our closest European allies became strained.

Yet throughout the swings of the past several years from crisis to confidence, the march of technology has not only continued, but quickened dramatically. For most of us, its spread has been received joyfully, promising unimagined new capabilities in information management, dramatic productivity improvements and the promise of a more fulfilling life-style.

But high tech has also brought with it an unprecedented concern about the potential for its abuse. Americans are coming increasingly to question our country's reliance on computers for its national defense. Revelations of the adventures of teenage "hackers" this year have made us realize how vulnerable our information resources really are. And, ironically, new evidence is emerging that Korean Air Lines Flight 007 took its ill-fated course as the result of a computer data entry error.

Also, many Americans now worry about the vulnerability of their privacy to computerized invasion. A recent Louis Harris poll found that 77% of Americans are concerned about this issue, up from 64% just five years ago [CW, Dec. 12].

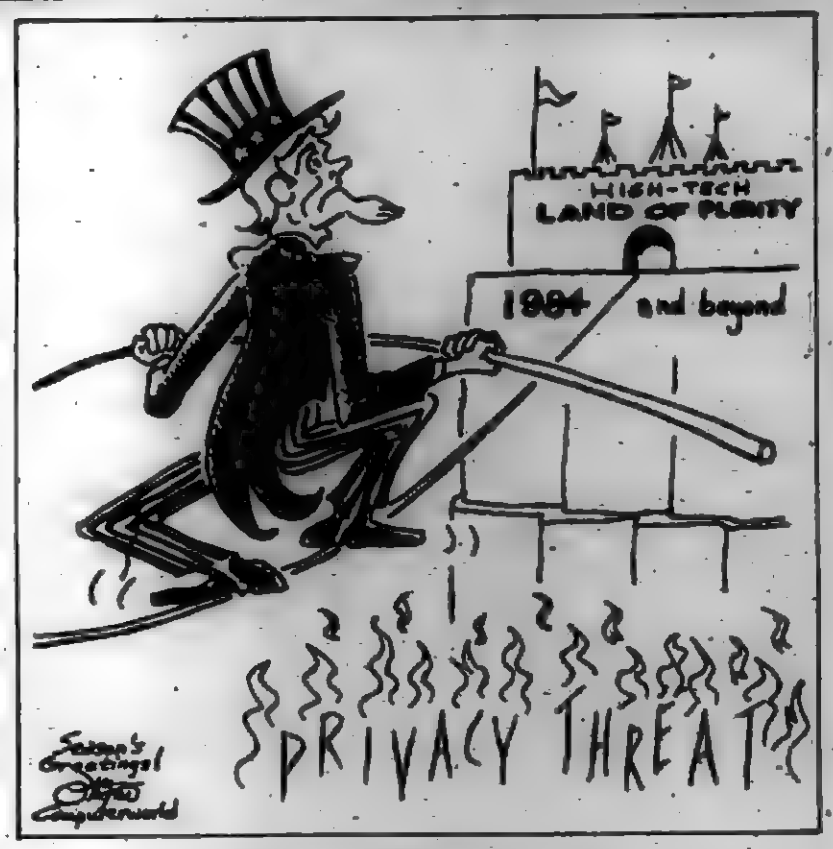
On the other hand, an overwhelming percentage of the survey respondents think science and technology has been generally beneficial. Over 90% see a big rise in productivity through the use of high tech in the work place.

The practical benefits of computers are becoming apparent in myriad new ways. New applications in expert systems have moved computers out of the hospital billing department and into the doctor's office, where they help physicians make more informed diagnoses. Computer-assisted design applications are helping engineers to work out potentially dangerous design problems before products reach the public. And Americans are discovering with delight that a computer in the home can be a welcome boost to their children's educations.

America's love/hate affair with the computer will intensify as the pace of technology quickens. The question remains which emotion will ultimately triumph. Clearly, public concern about the possible invasion of privacy from computers deserves notice. Legislation in this area is critical if computerphobia is to be overcome.

However, high technology also deserves an occasional pat on the back. Recent world events, at times, may have caused us to question the ability of humans to survive their own frailties. But computer technology has also set an example that we can all emulate. Even as suspicion about the motives and practices of some of our largest institutions has become ingrained in our consciousness, high-technology companies, with their high standards of competitive ethics, continue to top lists of the most respected companies.

As 1984 approaches, we cannot help but to be haunted by the specter of technological oppression raised by George Orwell's futuristic novel *1984*. However, we can also be buoyed by the possibilities that computer technology holds in store a truly better way of life. It is now more critical than ever that business and government unite to reassure the public that computer technology can and will be controlled. And it is up to all of us to applaud and encourage the true benefits we have gained from computer technology in recent years. Progress is stimulated by an atmosphere of acceptance, but stagnates in an atmosphere of fear.



LETTERS

Alternative Route

I agree with Harold Lundy's argument in the In Depth article "Justifying Subsecond Response Time" [CW, Nov. 21] that programmer productivity will improve significantly in the subsecond response time range. The question is: Will reprioritizing really help large TSO shops (and Roscoe or Wylbur shops for that matter) ever come close to subsecond response time, especially when production consistently requires high priorities?

The study does set the reader on the right path, but neglects to point out a fork in the road — and a path less traveled by.

Rather than shifting priorities and going through the gyrations that inevitably lead to an expensive CPU upgrade (and the same cycle of response time problems, reprioritizing and more upgrades and programmers working at all sorts of odd hours), a company should explore the alternative route, which is not only cheaper, but far better for the management information systems operation as a whole.

Many firms have taken the off-line, yet interactive, development route and reaped tremendous benefits as a result.

My firm needed a system that not only offered consistent subsecond response times, but powerful development tools, too — one that would allow us to continue programming in Cobol, communicate to multiple mainframes (from IBM and Sperry Corp.) and was, above all, affordable.

We found a product called Maestro, by Softlab Systems of San Francisco. It eats TSO's lunch (and Roscoe's and Wylbur's), but not mainframe resources. Our programmers are not only twice as productive, but they're home in time for dinner, too.

Robert Gregory
West Orange, N.J.

'Not the Usual Piffle'

I'd like to thank *Computerworld* for publishing Barry L. Abramson's article "Reducing Security Risks Associated With VM Access" [CW, Dec. 5]. This delightful piece of humor brightened an otherwise gray day here.

Abramson's situation is a perfect backdrop for comedy — sharing one VM virtual machine among six divisions. Where I sometimes pretend to work, a typical programmer will have six virtual machines for his own use.

Another masterstroke was to add the interminable series of prompts before allowing someone to edit a file. I invoke the EDIT command at least 100 times a day. I'm surprised Abramson didn't let his comic sense run free and have a team of system programmer commandos tunneling under the raised computer room floor to bomb the CPU into tiny pieces of silicon.

But the concept that makes Abramson's piece a work of genius, and not the usual piffle that we have to wade through in our daily lives, is the policy he describes of requiring all users to submit a written request for any given file to be erased.

What an idea! What opportunities for bureaucracy. The reams of paper. I can see it now: "Why do you want to erase that file? We'll just give you another zillion cylinders of storage — that way you can save *everything*."

I certainly hope Abramson has found a way to forbid people from using file modes A0 and A3, from giving out passwords and from insisting on working long hours from remote locations using dial-up lines. In fact, I hope Abramson finds a way to make sure that no power is provided to the CPU: That's a sure way to keep it secure.

LECHT ON SCIENCE/Charles P. Lecht

George Orwell's Roasting: Medium-Well, Please

As we enter 1984, a crowd of folks who should be in the know will be asked their opinions of this year's state of affairs as compared with those depicted in George Orwell's monumental work with that date for its title. Virtually all these experts will observe that if he meant his novel's somber social portrait to serve as an actual forecast for 1984, he was way off base. Often enough, they will go on to say that any real threat of Orwell's dour vision being realized could be indefinitely postponed by increasing our defense spending, developing better surveillance techniques, providing more "pointed" education on who our "enemies" are and exercising yet more intelligent control over our free press.

Indeed, I surmise that if Orwell were around in 1984, he would surely be the subject of one of the grandest "roastings" of all time, although, curiously enough, there is ample reason to believe that it would be unwarranted. Notwithstanding the many discrepancies between the actual state of the world as we near 1984 and the vision Orwell would seem to have had of that same time, it is highly likely that his book was intended more as a parable or as an overarching cautionary tale than as straight prognostication. Indeed, it was some time before Orwell was persuaded to accept the title by which his work came to be known; evidently, his preference had been for *The Last Man in Europe*.

To an extent, the subject and substance of *1984* were drawn from the (barely disguised) fears provoked in Orwell by sociopolitical tendencies emerging in the late 1940s, not only in the West, but in the East and elsewhere. He almost certainly was not offering a literal forecast for 1984, although it must have occurred to him that many people might think so.

> *'Most every government, it seems safe to say, will take the position that the world in which it happens to be living is vastly different from Orwell's imagined one and, by its lights, vastly better. To the extent that any one of them would be prepared to acknowledge some Orwellian characteristics in itself, it would probably dismiss these as relatively minor (albeit warranted for some reason or other) when compared with the massive contamination afflicting the body politic in "enemy" countries.'*

Had he done no more than create a great and enduring sci-fi novel (which he did), he would, in *1984*, have earned himself a degree of respect that rarely attaches to authors in that genre; for his ideas on totalitarianism were so thoroughly and convincingly worked through that he succeeded in giving to the language, in his own name and that of Big Brother, two shorthand terms by which the whole world now recognizes the sort of monstrous dictatorship that leaves us no moment or place of refuge from total terror. Whatever Orwell's actual intentions, we can be grateful to him for providing us with a special reason to reflect upon world government as we enter 1984 and to seek out new insights into it and ourselves. And this, we know, is always useful.

Orwellian Characteristics

Most every government, it seems safe to say, will take the position that the world in which it happens to be living is vastly different from Orwell's imagined one and, by its lights, vastly better. To the extent that any one of them would be prepared to acknowledge some Orwellian characteristics in itself, it would probably dismiss these as relatively minor (albeit warranted for some reason or other) when compared with the massive contamination afflicting the body politic in "enemy" countries.

Governmental variations upon this theme are as wide as the planet itself: from the Italians, who can be forgiven if they view any government they elect as fully Orwellian, after having lived through Mussolini, to the Soviets, who admit no trace of Orwellianism, apparently, viewing their enforced reeducation camps in Siberian subzero temperatures as a rewarding experience for their citizens who do not share the Communist party's opinions.

Just how much Orwellianism exists in any country is hard to determine, but I think there is strong (circumstantial) evidence to support the thesis that the world described in *1984* has more or less globally arrived in 1984. Certainly, most of the world takes the view that most of (the rest of) the world is comprised of more-or-less Orwellian, totalitarian states. The roughly equally populated East and West blocs appear to hold that opinion of each other, and both of them behave as though they regarded the Third World in that way.

Instrument of Propaganda

Did or did not Orwell's work foresee that an inevitable fixture of 1984 would be "the enemy," an instrument of propaganda utilized by one's own government to keep one alternately enflamed or terrorized into submission to the strictures of one's local polity? One need not look too closely at the "news" programming emanating from the respective Ministries of Truth of East and West to confirm this sad actuality. Big Brother and his enemy seem almost to share the intimacy of the same object reflected in different mirrors, down to the last detail of olive branch and bomb.

Also, it is inarguable that Orwell's

HUMAN CONNECTION/Jack Stone

User Emancipation From Big DP Brother: 1984

The reality of life in 1984, at least within the microcosm of the computer society, is far different from the dire predictions of George Orwell in *1984*, wherein Big Brother and his followers placed the citizenry into a state of virtual slavery.

In the coming year, users are taking the strongest position ever to establish their independence from what many perceive to be the strangling bureaucracy of data processing departments. They are using the political leverage that derives from knowledge, experience and the headiness from installing successful systems themselves, albeit systems on the micros and small minis and, hence, of miniscule dimensions when compared with those running on the mainframes.

Not an insignificant number of users are even elevating themselves into lofty levels of arrogance, making the now oft-heard claim: "With only a personal computer and some quick code written for a $400 generalized data base manager, I've come on-stream with a superpowerful information system." Indulging in such an attitude, and using their gift of gab, users are surely venting their past frustrations with their computer center dealings to the top-level decision makers and attempting to use their personal computer expertise as leverage to get control over the data processing establishment.

> *'Without question, users are making life for DPers more miserable than ever; their ignorance in years past was difficult enough to deal with, but the high-and-mighty distain for computer professionals that some of them display in real time after a few hours of fooling around with a personal computer is really tough to swallow.'*

Without question, users are making life for DPers more miserable than ever; their ignorance in years past was difficult enough to deal with, but the high-and-mighty disdain for computer professionals that some of them display in real time after a few hours of fooling around with a personal computer is really tough to swallow.

User Pseudoknowledge

However, to deal with the alarmingly rapid growth of user pseudoknowledge of computer systems, the answer is not — and cannot be — to avoid it, but to address it head on and in calm, measured, intelligent and rational ways. Here are some thoughts that may be useful to you if you are struggling with your users:

- If you have been around the business for more than just a few years, you surely know that for every generation of new equipment technologies, there arises a new wave of proliferation of machinery in the user areas that is typically acquired not with reasonable justification, but on a helter-skelter, seat-of-the-pants basis.

The current explosion in personal computers is no different, except that it is not untoward to learn of users who select their personals in more bizarre ways than ever, such as how their first graders work with Logo. Surely, central coordination — if not control — of personal computer acquisition is mandatory if the corporate coffers are not going to bleed to death from the constant demand from users for support of computing machines, software, documentation, training and supplies from every nook and cranny of the business.

- Your center must organize, if it has not already, a team of systems specialists whose sole job is to work with the users and help them to separate fact from fiction and whimsy from reality when it comes to the age-old issues of what computers can and cannot do and which ones are the right choices for the solution of user problems.

Users have to be straightened out on many matters that we take as given, but that come as shocks of enlightenment to many of them, such as that disk space is not infinite and some software will not handle files spread across volumes; some systems installed on "fast machines" run agonizingly slowly because the software is poorly written; formal training sessions are not the end of user learning, but rather they are the beginning of a life-long, self-developing experience; and they should search for answers to their trivial technical questions in the documentation, though not by pestering the data processing department.

Orwell's Roasting: Medium-Well, Please

(Continued from Page 107)
description of individual freedom in 1984 fulfills many of our views of its actuality in 1984. His thesis envisaged the subjugation and enslavement of the people by an increasingly automated, mind-controlling state. Certainly, our Communist neighbors, in our judgment, have lent more than sufficient credence to this vision of 1984. Alas, by theirs, so have we.

Startling, isn't it? Almost everyone in the world believes that the preponderance of the rest is in thrall to a Big Brotherly dictator. Each nation speaks of the slavery in which the governments of most others hold their respective populations; the enslavement process is said to be advanced by a group of soulless (that is, robot-like) order followers, whose threats are validated in the eyes of a quivering, cowering citizenry by the appearance on their screens of a fleshless, Big Brother video image. Americans affirm that individual freedom in 1984 is Orwellian for at least 75% of our brethren here on Earth, by my reckoning. Not bad, as an example of accuracy in a futurist.

And what is there to say for Orwell's view of history and books in 1984? Subjected to brainwashing and physical torture, citizens are compelled to relearn history — or fail to do so at their peril. They are adjured to understand that to control the history books (and their analogs) is to control and, thus, to invent history.

Revised Histories

Since the turn of this century alone, many countries have seen fit to revise their official histories in response to political upheaval, economic dislocation, population migrations and other such traumatic manifestations.

Not long ago, some Germans believed that they could revise history by burning books and that it might even be more thorough if they incinerated a few flesh-and-blood authors and readers into the bargain.

It does not take too much imagination to intuit that the history of Persia endorsed by the Ayatollah Khomeini may vary from that promulgated by the supporters of the late Shah Rizah Pahlavi. Could we argue against the importance of knowing how to relearn history if, having been born into yesterday's version of it, we now wished to live happily in today's Iran, Cuba, Vietnam, USSR, People's Republic of China, Yugoslavia, Poland, Czechoslovakia, Hungary, Rumania, Tibet and so on? The official alternatives to reeducability have often been unpleasant, when they have not been terminal.

Examples of Orwell's accuracy as a forecaster (never mind whether he aspired to forecasting) abound. In Beirut, an international peacekeeping contingent could attest that war is peace. It is hard to think of a single communist country in which we, as Americans, would not see their freedom as slavery; as to their strength, we would just as surely view it as the product of the most lamentable, state-enforced ignorance.

All right, all right! Nineteen eighty-four may not resemble 1984 all that closely, but it is still too close for comfort. Consider this excerpt from the diary of the novel's protagonist, Winston: "April 4th, 1984. Last night to the flicks. All war films. One very good one of a ship full of refugees being bombed somewhere in the Mediterranean."

'Next Time We Count the Votes by Hand.'

MSA Launches System Aimed At Two Types Of Manufacturers

ATLANTA — Management Science America, Inc. (MSA) has introduced packaged software tailored specifically for manufacturers with schedule-driven operations.

As a cost-free enhancement to the MSA Manufacturing System (MRP II), the features can be used by both repetitive manufacturers and job-shop manufacturers who have some repetitive processes in their operations, the vendor said.

According to the vendor, most manufacturers consider themselves either job shop or repetitive, although the majority are both.

The system operates on IBM mainframe hardware under Cullinet Software, Inc.'s IDMS, Datacom/DB, IBM's IMS and DL/1 or Cincom Systems, Inc.'s Total data base management systems.

The schedule-driven capabilities combine MRP II, Japanese methodology and zero-based inventory concepts. Using those features, manufacturers can establish a production schedule, set a production rate, check on production progress and report on production vs. schedule automatically in an on-line, real-time environment.

According to the vendor, the system provides maximum support of "just-in-time" inventory policies. It gives manufacturers stringent control over their materials and labor, since it automatically reduces inventory and accounts for labor used at various checkpoints in the production process, the vendor said.

The system is priced from $150,000 to $350,000, depending on the number of modules, hardware and operating environment.

MSA is located at 3445 Peachtree Road N.E., Atlanta, Ga. 30326.

With TI, IBM; Service Also Introduced

UIS Inks OEM Agreements

KANSAS CITY, Mo. — United Information Services, Inc. (UIS) has announced its entry into the microservices market with the signing of multimillion dollar OEM agreements with Texas Instruments, Inc. and IBM and the introduction of its Vista Service.

According to the company, Vista integrates microcomputer hardware and software into the UIS worldwide communications network and large-scale host and application software services. The OEM agreements authorized the sale of TI's Professional Computer and IBM's Personal Computer with the information services of UIS. Vista currently works with TI's Professional Computer, and UIS said it plans to announce the IBM Personal Computer link in January 1984.

In addition to providing stand-alone processing capabilities, the microcomputers reportedly will act as a window to UIS's teleprocessing services. The interface software — dubbed Vistacom — included at no extra charge with the microcomputer, is said to control all asynchronous communications with UIS host services.

A spokesman for UIS said that when host computer services and communications are needed, Vista users will have the ability to link into UIS's teleprocessing network. Micro software packaged with Vista will enable users to perform word processing, spreadsheet, business graphics and records management functions. All third-party software written under Microsoft, Inc.'s MS-DOS operating system will run on the micros without modification, the spokesman said.

Prices for Vista range from $5,545 for the base unit, which includes the system unit, CRT terminal, 256K bytes of random-access memory, internal modem, MS-DOS and one-year on-site maintenance, to $8,910 for the base unit plus a Winchester disk drive and a 150 char./sec printer.

More information is available from UIS, which can be reached through P.O. Box 8551, Kansas City, Mo. 64114.

Sorting Techniques Enhance Release 6.0 of IBM's DF/Sort

WHITE PLAINS, N.Y. — New sorting techniques that are said to enable large systems to handle more applications are included in Release 6.0 of IBM's Data Facility Sort (DF/Sort) for IBM MVS and MVS/XA operating systems.

The new version reduces sort time by 14% to 40% over IBM's OS/VS Sort Merge Release 5, the vendor said. Enhancements to Release 6.0 include improved fixed-length record sort performance; improved variable blocked, spanned record sort performance; sort performance optimized to larger region sizes; and improved merge performance for variable-length records.

The product is also said to feature improved message handling; new statistics messages; improved installation/execution options; extended parameter list support and MVS/XA support. It also includes several functions from IBM's DOS/VS-VM/SP Sort/Merge Version 2.

DF/Sort operates with all processors supported by IBM's VS1, MVS or MVS/XA. A basic license is $231, with a distributed systems licensing option charge of $173 available through IBM, 1133 Westchester Ave., White Plains, N.Y. 10604.

Investigating Financial Modeling Alternatives

By Len Bergstrom
Special to CW‡

In the first part of this two-part series, Len Bergstrom defined some of the criteria you should establish before investigating the alternatives of financial modeling software. Bergstrom now provides some guidelines for investigating the alternatives.

Once the company's criteria have been established, you are ready to investigate the alternatives. Both general and specific criteria should be evaluated.

General criteria relate to the vendor, while specific criteria are associated with the financial modeling systems themselves. Positive and negative dominant factors should be identified for either category and applied to the full range of potential candidates.

The remaining criteria are then established by major categories (such as modeling and reporting) and weighted by elements (such as financial functions and graphics) within each category. Critical requirements should be emphasized more heavily. Remember that 100% satisfaction is rarely accomplished. Your goal should be to select a product that best fulfills the majority of the company's requirements.

An overview of remote computing services vendors can quickly and easily determine whether a vendor has the general characteristics required. A vendor's history and outlook can provide a comfort factor for subsequent dealings. Also, the type of hardware and operating software may or may not be compatible with needs. Of more direct significance is the availability of the network relative to corporate locations.

Application availability is of prime importance. What major financial systems are available and how do they relate to one another? What about data management? Are your areas of importance able to be accommodated with major systems or companion products? What external data bases and access mechanisms are offered? What are the vendor's future plans? Other areas to consider include pricing structures, service options, system reliability and support, documentation, training and consulting.

If you are evaluating a system for use in house, you should be concerned with product capabilities and the viability of the vendor. The majority of software vendors are relatively young and small, so the kind of general criteria used for remote computing services vendors may not apply. The user must also be concerned with contract negotiations, including performance guarantees and rights to source code under certain conditions. Installations of the product by multiple companies help insure against potential disaster.

Once you determine that a vendor meets your general criteria, analyze whether specific criteria are met by the financial modeling system. Financial systems components are very different according to individual planning systems, both in regard to specific integral components and in style of implementation. Although most claim to be "English language," the low range is actually close to a true programming language. Special attention should be directed to report generation, functions for financial and statistical operations and ease of use of documentation.

Some vendors say everything needed by the user should be embedded in a single system. Others adopt the philosophy of concentrating on specific activ-

(Continued on Page 114)

Startech Announces Release 2.0 of 'Viewcom'

WOODSIDE, N.Y. — Startech Software Systems, Inc. has announced Release 2.0 of Viewcom, an IBM CICS printer terminal spooling and automatic batch report distribution system.

Viewcom's IBM Personal Computer option supports printing from an IBM mainframe running under CICS to be directed to up to three printers connected to an IBM Personal Computer, transparent to the applications running on the Personal Computer, a spokesman said.

This feature can print multiple reports concurrently from the mainframe's CICS Viewcom print queues. A maximum of three printers per Personal Computer can be active simultaneously.

The Viewcom interface runs as a background task in the Personal Computer, independent of the Personal Computer application.

Viewcom Release 2.0 provides automatic transfer facility from the batch spool queue as well as automatic security checking with user exits. Additional functions include automatic unattended printing of reports, a virtual multiregion option and intersystems communications capability of routing any report in the Viewcom queue to another CICS address space in the same CPU or in a remote CPU to any remote job-entry station or the central-site printer. These Viewcom features will also function in a multiregion option or intersystems communications environment, Startech said.

In addition to these routing capabilities, Viewcom allows instant report auditing by allowing users to access sections of the report before printing.

DOS/VSE support in Viewcom Release 2.0 has been enhanced to provide both automatic and interactive on-demand batch report transfers to the on-line CICS Viewcom print queue.

Viewcom Release 2.0 costs $4,995 for DOS and $7,995 for OS packages from Startech at 25-39 Borough Place, Woodside, N.Y. 11733.

Intel Imax 432 Release For Its IAPX System Out

SANTA CLARA, Calif. — Intel Corp. has announced a release of the Imax 432 virtual memory operating system for its IAPX 432 micro-mainframe system line.

According to Intel, the Imax makes available blocks of main memory that contain data that is no longer being accessed and puts them through a process known as "garbage collection," which involves the deallocation of these unused memory blocks. After deallocation, the system performs a compaction process whereby it combines various-size blocks into large contiguous blocks to provide ample memory capacity.

Written in Ada, Imax 432 is said to make use of Ada's generic package concept. For example, the vendor said, a generic I/O sink module can be used to send data from a port to a disk system, a CRT display, a line printer or a laser printer. The programmer takes the generic package or module and fills in the specific information determined by the type of output device. The programmer does not have to write the entire output driver module and can instead work with the appropriate Imax generic module.

The cost of Imax is determined by quantity. The first copy is priced at $8,000 from Intel at 3065 Bowers Ave., Santa Clara, Calif. 95051.

Receipt Aid From CSU Runs On NCR 2950

CHICO, Calif. — California State University (CSU) at Chico has announced a cash receipting software package for use with the NCR Corp. Model 2950 terminal.

According to a CSU spokesman, the package prints receipts, locates and displays information about the transaction on the terminal, prompts for needed data and, at the end of each cashier cycle, transfers the data collected to a Control Data Corp. Cyber series mainframe. The package also is said to print reports with varying levels of detail, and it updates several subsidiary systems. It was designed to interface with the systemwide Financial Accounting System.

The vendor said that the program is easy to modify because of its modular structure.

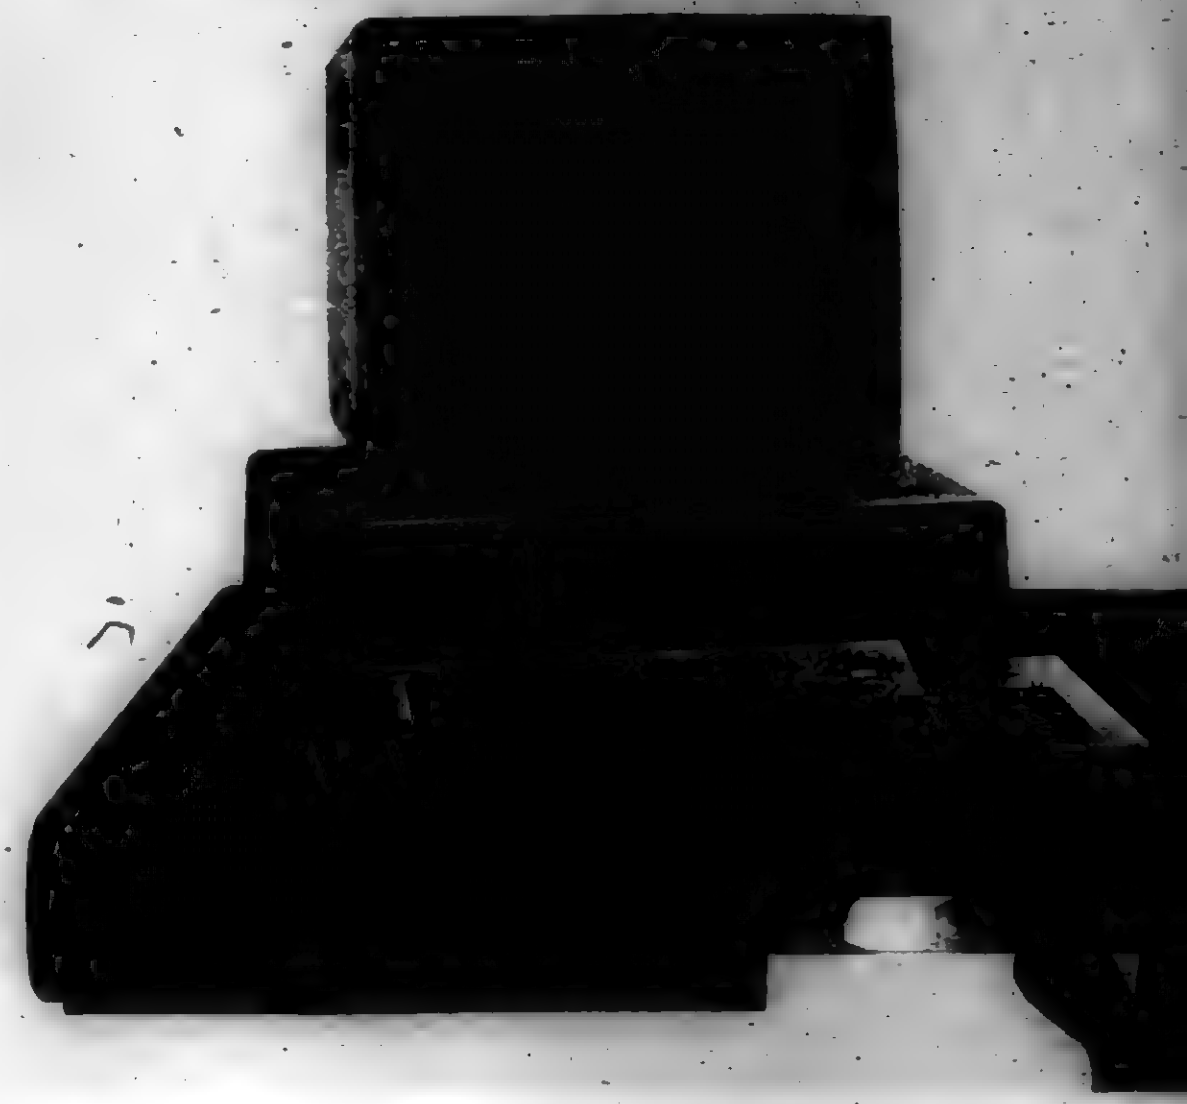
For each transaction, a cashier selects the screen for that transaction type, then follows as it prompts for information. When the transaction is complete, a receipt is printed, a journal tape is printed, and checks are endorsed by slip number and receipt number.

The cash receipting package is said to be a collection of programs written in NCR Basic and Cobol. The NCR Basic programs operate on the NCR Model 2950 terminals, and the Cobol programs operate on the Cyber processor.

The package is priced at $5,000 from CSU, Chico, Business Affairs Office, Chico, Calif. 95929.

Announcing the State of the Smart.

IBM 3270 Personal Computer



Utility Offered for MVS/XA

HOLMDEL, N.J. — CGA Software Products Group, Inc. has introduced a data center management utility designed for IBM's MVS/XA operating system.

According to the vendor, Single Image Software Version 7.1 is able to simplify error-handling diagnosis and reduce the number of load modulest and library size requirements for the operating system. It reportedly supports recent IBM program temporary fixes in the MVS operating system.

The software is now available for lease at $625/mo per site with the vendor's Multiple Systems Integrity Facility, $7,500 per year with the Global Console Director, $7,512 per year with the Multiple Systems Manager and $1,525 per month or $18,300 per year for all three, according to a spokesman for the vendor.

Additional information about the utility is available from CGA Software Products Group, which is located at 960 Holmdel Road, Holmdel, N.J. 07733.

System Utilizes HP's Image DBMS

PHOENIX — EDP Construction Systems has introduced the CAS/3000, a menu-driven, interactive, real-time construction accounting system which utilizes Hewlett-Packard Co.'s Image data base management system on the HP Series 3000 processors.

According to the vendor, all subsystems are totally integrated, allowing single-entry processing and multicompany, divisional and departmental processing within a single data base.

Subsystems include accounts payable, general ledger, job cost and accounts receivable, the vendor said.

The price is $30,000 and includes one year of system maintenance and initial training. EDP Construction Systems is located at 2910 E. Camelback Road, Phoenix, Ariz. 85016.

Lexis, Nexis Now Available Via IBM Personal Computer

DAYTON, Ohio — Mead Data Central, a division of Mead Corp., has announced that its Lexis and Nexis data base services are now available via the IBM Personal Computer and other terminals.

Nexis and Lexis, previously available only via terminals leased from Mead Data Central, reportedly can be accessed through the IBM Personal Computer, the IBM Displaywriter, the IBM 3101 terminal and the Televideo 950 terminal.

The company also has reported that it is negotiating with other computer manufacturers regarding the use of those computers to access the data base services.

Prime-time connect rates for Lexis and Nexis reportedly are $90 per hour for up to five hours monthly, $75 per hour for six to 10 hours, $60 per hour for 11 to 100 hours and $30 per hour for more than 100 hours. Off-peak rates are $45 per hour for less than 100 hours and $30 per hour for more than 100 hours. In addition, there is a surcharge of 45 cents for each word search unit.

More information is available from Mead Data Central, 9393 Springboro Pike, P.O. Box 933, Dayton, Ohio 45401.

If you're looking for a personal computer that will satisfy your company's professionals and managers, IBM now has exactly what you need. The new IBM 3270 Personal Computer.

The fact is, many personal computers can be *too* personal for many business environments. Not the 3270 Personal Computer. Its strength is the ease with which it communicates with IBM hosts and office systems—in the next room or around the globe.

The 3270 Personal Computer is designed to accommodate the way people actually work. It can display in color up to seven windows of information at one time. Four with data from host computer applications (on the same or different hosts), two electronic notepads and one personal computer session. And despite its impressive capabilities, the 3270 Personal Computer is small enough to sit on a desk without taking it over.

The information windows can be moved, just as a person moves papers on a desk. They can be made bigger or smaller, put on top for immediate attention or temporarily hidden when not in use. Information on the screen can be processed, printed or exchanged between windows. And the 3270 Personal Computer can be programmed by the data processing professional to meet the needs of each end user or department.

The IBM 3270 Personal Computer offers outstanding price/performance. And volume discounts are available. It could turn desks throughout your company into very Smart Desks.

Source Members To Receive E-Com Service

MCLEAN, Va. — Source Telecomputing Corp. has announced that members of the Source, its on-line information and communication service, will now be able to utilize the U.S. Postal Service's Electronic Computer-Originated Mail (E-Com) from their microcomputers.

According to Source Telecomputing, the E-Com service provided on the Source is contracted through an E-Com-certified telecommunications carrier in New York, where messages are received from members of the Source, batched, processed, sent on to serving post offices and delivered as first-class mail. Reportedly, the arrangement allows individual members to use E-Com as often as necessary without having to send a minimum of 200 messages per day, which is required of E-Com's corporate clients.

E-Com is one of several messaging services provided through the Source. Messages can be composed on-line using the editing capabilities of the Source or off-line where they can be uploaded for electronic delivery. The three primary messaging services are E-Com, which costs $1.35 for the first page and 25 cents for subsequent pages; Western Union Mailgram messages, which range in cost from $3 to $5.15; and Sourcemail, which delivers messages to any other member of the Source beginning at 13 cents per minute.

The Source is said to be compatible with any microcomputer or terminal and can be accessed via a local telephone line in 500 U.S. cities. Costs include a one-time $100 membership fee, with basic hourly connect charges ranging from $7.75 to $20.75 from Source Telecomputing, 1616 Anderson Road, McLean, Va. 22102.

Genesys Launches 'Search-All' for IBM DOS, OS

LAWRENCE, Mass. — Genesys Software Systems, Inc. has announced what it describes as a one-button human resource information and decision system for mainframes using IBM's DOS and OS.

Search-All reportedly is designed to work with Genesys' IBM Payroll Accounting, Personnel Administration and Deferred/Cafeteria Benefits Management Systems. It is said to integrate into one application capabilities such as query, information generation, on-line report writing, modeling and forecasting.

Search-All is said to let users decide what to look for and what to do with it in determining alternatives and to refine qualifications continually. The system is said to be menu driven, eliminating the need for users to know complicated syntax.

According to Genesys, Search-All will be available Feb. 1 as a free added feature for its All-Screen package, or at $40,000 for DOS systems and $45,000 for OS systems. All-Screen reportedly costs $35,000. Genesys may be reached at 20 Ballard Way, Lawrence, Mass. 01843.

Price Hike Announced for 'DOS Jars'

McLEAN, Va. — Johnson Systems, Inc. has announced an immediate increase in the price of its DOS Jars Job Accounting Report System for use in IBM's DOS and OS operating system environments. The new permanent license fee is $7,500, including the DOS/Power/VS option, a spokesman said.

DOS Jars is an accounting, billing and performance measurement system that enables users to account accurately and bill equitably for all resources used in the DOS and OS environment. The package consolidates information about computer resources on IBM's System 370, 30 series, 4300 series and compatibles.

Johnson Systems' Marketing Services Department is located at 6300 Greensboro Drive, McLean, Va. 22102.

IBM 5080 Gets Graphics Tool

BOULDER, Colo. — Precision Visuals, Inc. has announced DI-3000, graphic tools support for the IBM 5080 Graphics System.

The system can be utilized by system integrators and application developers in engineering, scientific and computer-aided design installations.

Written in Ansi Fortran, DI-3000 is an integrated system of 200 user-callable subroutines developed in accordance with both Core and evolving Ansi standards, the vendor said.

The package supports a range of graphics terminals and hard copy devices and simplifies access to more advanced hardware features by presenting the application developer with a "virtual device" interface.

Prices for a 25-year license including the new driver will depend on the IBM host machine's class but will start at $12,000 for the 4300 series, $15,000 for the 3030 series and $19,000 for the 3080 series. The driver alone, which will be released concurrently with the IBM 5080 system, will range in price from $2,000 to $4,000 depending on mainframe.

Further information is available from Precision Visuals, 6260 Lookout Road, Boulder, Colo. 80301.

Tape System For HP 3000 Unwrapped

SAN JOSE, Calif. — Mednick Enterprises has announced the Tapes/3000 tape management system for the Hewlett-Packard Co. HP 3000 computer.

According to the vendor, Tapes/3000 reduces the risk of losing or overwriting data by requesting and cataloging magnetic tapes as they are used. The package reportedly also performs most tape librarian functions. It will accept data from on-line users and operators, from job streams and the HP 3000, and it uses the data to keep track of each tape in the system.

There are four programs in Mednick's tape processing system. The Tapes Maintenance program is used to maintain information about data set characteristics and tapes in the system. The File Request program is used to request input and output tapes to be used by the job or session. A Scratch program is used to automatically scratch all tapes that have expired according to the date or generation/version count. The Operator Utility program is for special cases such as handling missing scratch tapes, resetting in-use flags, inputting non-HP 3000 tapes into tapes and getting the current Scratch tape count.

Tapes/3000 is priced at $2,500 from Mednick Enterprises, located at 1680 Arbor Drive, San Jose, Calif. 95125.

INTELLECT.™
NO SOONER SAID
THAN DONE.

To use INTELLECT, the natural language query system, all you have to do is ask—in everyday conversational English—and you'll retrieve. Immediately, in either text or full-color graphics.

INTELLECT, the world's only successful true natural-language query system, is an ideal tool for your information center. INTELLECT's powerful information retrieval capabilities are so advanced that it understands questions and responds with answers as if you were talking to a knowledgeable colleague. Executives access data themselves,—more easily than ever before—without learning any technical jargon or "computerese." It's so easy to use, it doesn't even have a training manual!

Whether you use INTELLECT as a retrieval system or as an effective data analysis tool, it transforms raw data in the data base into information and presents it in finished color graphics in a matter of seconds. It's a live dynamic interface that fully integrates your existing database and graphic systems.

Already hard at work in hundreds of organizations, INTELLECT is ideal for marketing, finance, personnel, manufacturing, and banking applications.

INTELLECT is an important technological breakthrough. You can learn more about it by attending one of our nationwide seminars. Or put its amazing power at your fingertips in minutes with one of our demonstration tapes.

Call or send coupon for more details. Look into INTELLECT, and be an eyewitness to the future of computing.

Tell me more about INTELLECT.

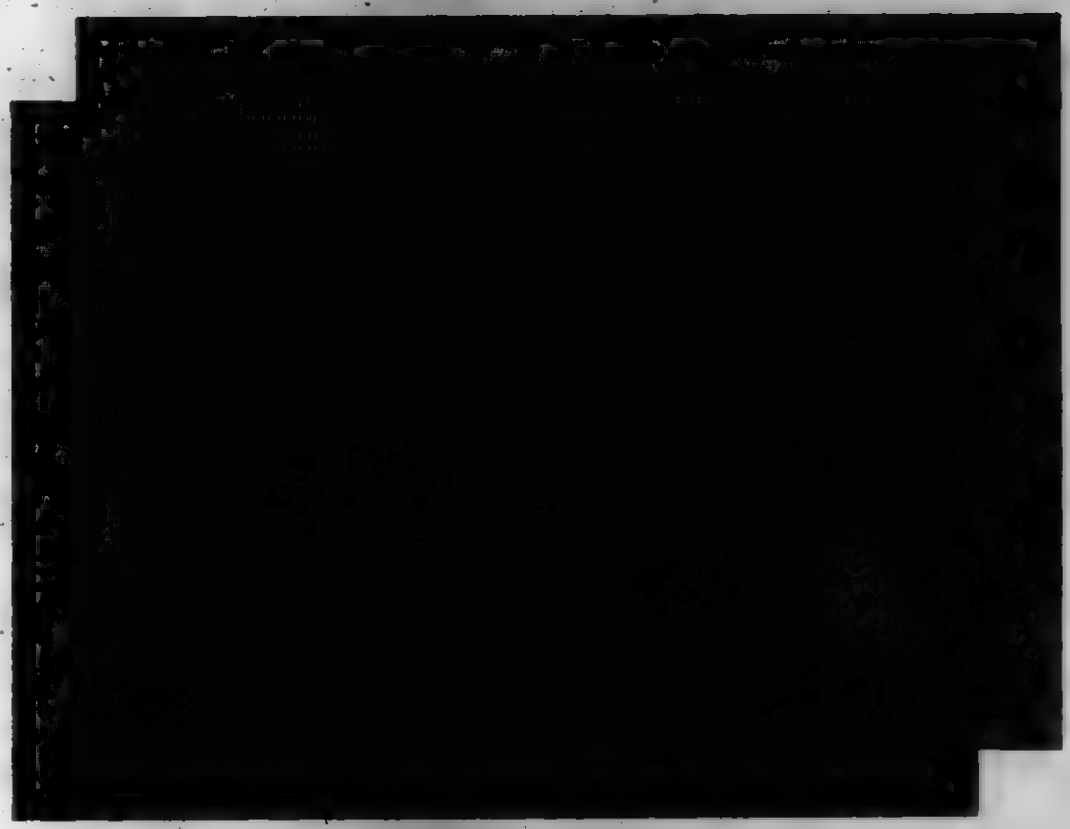
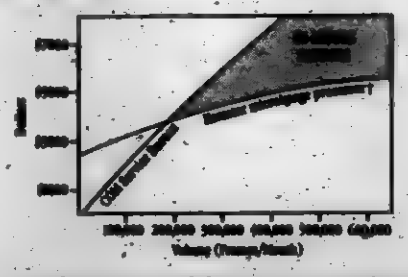
Don't pay this bill.



Run your own in-house COM for less with a Kodak Komstar microimage processor.

The decision is long overdue. Especially if your monthly computer output is close to a quarter-million pages.



That's when a Kodak Komstar microimage processor not only pays great dividends in faster, easier turnaround but can pay for itself in two years or less.

The chart here shows the break-even point based on the above service bureau bill.

But what it doesn't show are all the applications you're probably putting on paper: Internal SYSOUT. Security reports. Or time-sensitive data.

So instead of spending lots of money on a COM Service Bureau, spend it on your own Kodak Komstar 100, 200, or 300 microimage processor.

Send in the coupon today. Or call toll-free 1-800-44KODAK (1-800-445-6325), Ext. 300. And take the smart way out of next month's bills.

Please have one of your representatives contact me with more information on a Kodak Komstar microimage processor.

Set of Design, Development Tools

National Semi Unveils 'Plan'

SANTA CLARA, Calif. — National Semiconductor Corp. has announced the Plan software package, a set of interactive design and development tools to simplify the implementation of systems with Monolithic Memories, Inc. Programmable Array Logic (PAL) devices.

The Plan system, according to the vendor, automatically selects the correct PAL configurations, reducing the amount of time spent in search and evaluation. The package consists of three programs, Plus, Serv and Prog, which were developed to guide designers from initial Boolean logic expressions through device selection and documentation to the actual programming of the devices.

The Plan package is said to interface with most programming systems and uses notations similar to those of Monolithic Memories' Palasm design tools. Its comprehensive messaging operation includes error alerts, device-selection guidance and prompts.

Serv allows assignment of the previously defined logic to a different device and reassigns pin-outs, provides pin-out diagrams, fuse maps or equations to the CRT terminal or printer for documentation. Prog provides the logic and device data to a device programmer for programming or verification, automatically selects the proper PAL and pin assignments and creates a permanent disk file representing the defined logic equations and the device fuse map in the chosen format.

The package is priced at $195 from National Semiconductor, 2900 Semiconductor Drive, M/S D3696, Santa Clara, Calif. 95051.

Fortran Engine Accelerator Off-Loads IBM, DEC Units

SEATTLE — Flexcomm Corp. has announced the Fortran Engine accelerator, which the company said can be used to off-load IBM mainframes and Digital Equipment Corp. VAX-11 minicomputers.

The accelerator is reportedly a turnkey system that uses a Gould, Inc. Concept 32 superminicomputer and Flexcomm's proprietary communications software executing in both the Gould processor and the host, which are connected by a high-bandwidth data link.

The Fortran Engine is said to allow an installation to recover large amounts of CPU resources that are currently consumed by computation-intensive Fortran applications.

The package offers conversion services to transport the existing Fortran applications to the Gould supermini, according to the vendor.

It will be priced at approximately $500,000, depending on configuration, from Flexcomm, which is located at 15245 Pacific Highway S., Seattle, Wash. 98188.

Madic Adds General Ledger Module To Corporate Information System

SANTA CLARA, Calif. — Madic Corp. has announced a general ledger module as an addition to its Corporate Information System, an integrated closed-loop management information system for manufacturers and distributors.

The general ledger contains features that enable users to produce detailed financial statements from multiple levels of general ledger files and runs on Pick Associates, Inc. and compatible computers.

According to the vendor, the module's major features include comprehensive audit trails, customized financial statements and an extensive budgeting system.

The Corporate Information System is available for $105,000 (individual modules not available) from Madic, 3960 Freedom Circle, Santa Clara, Calif. 95054.

Selecting Financial Modeling Systems

(Continued from Page 109)

ities with interfaces to various functions. Again, user criteria determine what style is most appropriate.

An in-depth benchmark problem review should be performed to learn how different systems accomplish identical tasks. While this is not a complete answer, it can provide some solid comparisons from which commonly used activities can be viewed. How easy are models to build and change? How does one ask "what if" questions, perform sensitivity analysis or do backward iteration or goal seeking?

Selected benchmark usage should be observed in light of the established criteria. If you need features such as automatic reordering of logic statements and the solution of simultaneous equations, the field of choice narrows dramatically. Benchmarks allow you to obtain an additional level of comfort. They are often "decision clinchers" in many feasibility studies.

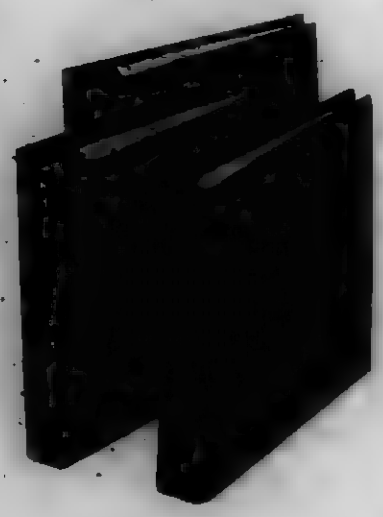
Comparative cost factors need to be understood. However, it is not a simple matter of looking at the different costs of CPU time. Connect charges and storage costs can far outweigh the cost of computations. Personnel time may turn out to be the overriding factor. The availability of discounts, minimums and initiation of service charges must be considered. Also, differing rates for remote job entry and remote and local batch processing can be influential, especially if you are willing to wait a few hours for results.

If you are selecting a product for in-house use, costs are a very different concern. Many authors offer their products on a free-trial basis before a license agreement is enacted. Maintenance, documentation, training and consulting are usually offered on a variety of terms. The effect of the product on system efficiency is difficult to ascertain unless the product is put up on your in-house environment.

The final step is to contact user references, especially those in your industry segment with similar applications and environments.

Now some disconcerting news: Once a system is carefully selected, your job is not complete. It is essential that users evaluate and periodically reevaluate their criteria and the changing means of satisfying those criteria.

Bergstrom is a principal and vice-president of consulting services at Real Decisions Corp. in Stamford, Conn.



DASD MANAGEMENT AWARD WINNER

The world's leading DASD management system, installed in more than 750 Fortune 1000 sites. Tailored to IBM VS1 and MVS, operating environments, yet doesn't rely on any IBM utility. DMS/OS — with disaster recovery — gives you more space and more usable DASD reports. Here is a direct-access storage device management system that dramatically reduces DASD conversion time, frees up operator time, and provides enforced control standards.

Is it any wonder that over 75% of world's leading industries turn to Sterling Software Marketing and DMS/OS for DASD management?

For a free on-site evaluation without obligation, call TOLL FREE 800-824-8512. California, Alaska, Hawaii, and Canada call collect 916-441-7234. Ask for Ext. 41.

Innovator 300 LPM Printer System

Now! Compatible with nearly any micro, mini, and mainframe.

The Innovator printer system can interface with your IBM, Burroughs, DEC, RS-232 Serial and many additional communication protocols. Also, the highly reliable, field proven Teletype™ mechanism provides years of virtually maintenance free performance, significantly lowering your cost of ownership. Starting at..... $4,995

FEATURES:
- Impact printer with fully formed characters
- Ultra quiet acoustically damped cabinet
- BSC/SNA compatibility
- Micro-processor controller/interface board
- 132, 80 column, heavy-duty print mechanism
- Low cost nationwide service

The Barrier Security Unit

Security Unit Said To Limit Access To Minis, Micros

ORANGE, Calif. — International Anasazi, Inc. has announced a data security device designed to limit access to minicomputers and microcomputers that receive data over 300 to 1,200 bit/sec dial-up asynchronous lines.

The Barrier reportedly allows calling terminals to connect with the dialed host only after accepting the appropriate user-programmable password. It is said that the user can program up to 63 characters for the access greeting message and another 63 characters for the access granting message.

According to the company, the Barrier is designed to hang up after three invalid password attempts. The unit is said to function with all 300 to 1,200 bit/sec modems and is installed between the modem and the secured computer.

The Barrier is available now in limited quantities and is scheduled to be available in large quantities by February 1984. It costs $369, according to the vendor. International Anasazi is located at Suite 202, 2914 E. Katella Ave., Orange, Calif. 92667.

Home Banking Seen Poised To Displace Check Writing

By Jim Bartimo
CW Staff

There are 100 million checks written each day in the United States totaling 40 billion annually, and each check is handled by an average of 10.2 people.

But within 10 years, writing checks could be displaced by computer-aided home banking just as many bank teller windows have been displaced by the automated teller machine (ATM).

Home banking usually refers to access by the customer to his account via a personal computer and modem. In addition to offering up-to-date account information, home banking may offer access to financial services, such as Individual Retirement Accounts, and the ability to send checks electronically.

At the Bank of America in San Francisco, one of the first complete home banking programs was introduced at the end of November, and 25,000 home banking programs are expected to be on-line by the end of 1984. The $8/month service is available 18 hours a day, seven days a week and eliminates much of the need for writing checks.

Customers can transfer funds directly from their accounts to many department stores, home mortgage companies and utilities. Users have constant access to their account status simply by dialing the bank's computer. Unlike most home banking programs restricted to IBM or other major micros, Bank of America accepts any communicating personal computer.

"We think home banking will play a significant role in banking," according to Maury Healy, vice-president/director of marketing/public relations. "Years ago, the trend was to have a lot of branches — then it was ATMs. The need for brick and mortar branches is lessening now as banks harness these new technologies."

Indeed, the development of ATMs is comparable to the development of home banking. While 50% of the computer-literate Silicon Valley customers of Bank of America use ATMs, it has taken at least 10 years for the cash-dispensing machines to

(Continued on Page 116).

Davoxnet Allows Transmission Of Voice, Data

MERRIMACK, N.H. — A series of products to form a network allowing simultaneous transmission of voice and data, in both IBM 3270 and asynchronous protocols, over standard twisted-pair telephone wire was introduced recently by Davox Communication Corp.

Known collectively as Davoxnet, the products include two workstations that can be connected to the Davox controller by either telephone wire or coaxial cable; an interface for converting the standard controller from telephone wire to coaxial cable and for adding an expansion controller connected by telephone wire; and a software package for file transfer between IBM Personal Computers and IBM mainframes and the Davoxnet components.

The 1911 Intelligent Terminal reportedly provides for IBM 3270, Digital Equipment Corp. VT100 and other asynchronous emulation along with hookup capability for $2,175. The Professional PC Deskset workstation provides an additional feature on an integrated feature phone for $2,375.

The eight-port Davoxnet Interface is priced at $750, and the PC/Host file transfer is priced at $800. The Smart Button Administrator enables workstation soft keys to be changed remotely by an administrator or automatically by a host program and costs $750.

More information is available from Davox, 6 Continental Blvd., P.O. Box [illegible], Merrimack, N.H. 03054.

Zstem Debuts for Zenith's Z100

VANCOUVER, B.C. — KEA Systems Ltd. has developed Zstem, a smart-terminal emulator for the Zenith Data Systems Corp. Z100 running under the firm's Z-DOS operating system.

Zstem emulates a Data General Corp. Dasher D200 terminal and is said to provide parallel and serial printer support and bidirectional file transfer capability. Zstem users may configure several features, including data rates from 45.5 bit/sec to 38.4K bit/sec, the number of data, parity and stop bits, flow-control protocols and half- or full-duplex communications.

Zstem-D200 costs $124.95 from KEA Systems, Department ZCW-2, 11-811 Beach Ave., Vancouver, B.C., Canada V6Z 2B5.

Instant Cure for Computer Indigestion

John Beall & Company, Inc.

HP Net Analyzer Designed To Expand Test Capability

PALO ALTO, Calif. — Hewlett-Packard Co. has announced a network analyzer designed to expand testing capabilities for device characterization in the research and development laboratory and for production testing.

The HP 3577A network analyzer reportedly provides an integrated three-input receiver, graphics display and synthesized source. Also, the companion HP 35677A and HP 35677B S-parameter test sets are said to work with the network analyzer. The test sets reportedly also allow simultaneous display of transmission and reflection parameters.

The HP 3577A is said to be programmable over the HP Interface Bus. The company said simple programming codes minimize development time for automatic measurement software.

The product reportedly is useful for audio, video, baseband, intermediate-frequency and radio-frequency measurement problems and in areas such as sonar and digital communications.

The HP 3577A is said to cost $23,500, and the HP 35677A and HP 35677B cost $3,500 each, with delivery six weeks after receipt of orders. The company is located at 1820 Embarcadero Road, Palo Alto, Calif., 94303.

Terminal Ties Commands Of VT100, Tektronix 4027A

IRVINE, Calif. — CIE Terminals, Inc. announced recently a dual-personality, color graphics terminal that reportedly allows simultaneous use of Digital Equipment Corp.'s VT100 alphanumeric software commands and Tektronix, Inc.'s 4027A color graphics command structure and 4010/4014 emulation mode.

The CIT-467 employs Ansi X3.64 control sequences and provides rectangle, polygon, circle, arc and pie command functions, a company spokesman said. Compatible with 4027A graphics primitives, it also reportedly features full dot addressability, user-programmable scale factor and relocatable origin.

Video features include a 7- by 9-char. matrix, 132- by 80-char. column display, eight colors with 64 programmable combinations and a variable-speed smooth scroll up to 2,400 bit/sec, the spokesman said.

The unit costs $2,995 from 2505 McCabe Way, Irvine, Calif. 92714.

Fiberlink Units Announced For RS-232 Ports

WESTBURY, N.Y. — The Fiberlink Products Group of Math Associates, Inc. has announced a direct plug-in RS-232 Fiberlink, fiber-optic transmission system.

The XR-1150 reportedly connects two RS-232 serial ports between computer peripherals or microprocessors in the same manner as a standard interface cable. Contained within the shielded package is a full-duplex, 100K bit/sec optical transceiver said to allow operation at distances exceeding a mile between units.

Power for the XR-1150 can reportedly be supplied through spare pins on the integral DP-25P connector or by means of a plug-in ac adapter.

The units are priced at $349 per pair from Math Associates, 2200 Shames Drive, Westbury, N.Y. 11590.

Home Banking May Displace Check Writing

(Continued from Page 115)

become as widely accepted elsewhere.

Home banking "is certainly still in the initial phases," according to Sheldon Golub of the American Banker's Association in New York.

But most banks are enthusiastic about the new technology for a number of reasons. One is that banks will save money when paper checks are handled electronically instead of by 10.2 people.

Another reason is that banks are looking for ways to keep their customers. "With home banking, you're talking about a far greater capability for investing," Golub said.

The increased investment opportunities come about when the time lag involved in withdrawal and deposit is eliminated. So, someone with $100,000 to invest for only two weeks would normally keep the cash in a savings account, but could instead quickly put it into a higher yield investment electronically, Golub pointed out.

But not all banks are as enthusiastic as Bank of America. Shawmut Bank of Boston recently completed a pilot project offering basic home banking services to 100 existing customers.

While waiting for the results of the project to be studied, the bank remains tight-lipped. "We really don't have much to say," said Barbara Roux, project manager of electronic banking services.

Nearly Nine Million Computer-Involved People Around the World Rely on Our Publications For the News They Need.

We're CW Communications/Inc.; the world's largest publisher of computer-related newspapers and magazines. And wherever you go in the computer world, you'll find computer-involved professionals reading—and relying on—our publications. With highly trained and experienced editorial staffs all over the world, our publications give readers the best and most up-to-date information available in this rapidly changing industry.

Around the world:

We publish, co-publish or provide editorial services to the leading computer publications in the world, including publications in all of the following countries:
Scandinavia—Denmark, Sweden, Finland and Norway.
Western Europe—Germany, United Kingdom, France, Italy, Spain, Greece, the Netherlands.
The Mid-East—Kuwait, Saudi Arabia.
Asia/Africa—People's Republic of China, Korea, Japan, Singapore, Southeast Asia, South Africa.
The Southern Pacific—Australia.
Central and South America—Mexico, Brazil, Argentina, Chile.

In the United States:

In the world's largest computer market, we publish a whole series of publications that cover different aspects of the industry. Our largest publication, with more than half-a-million readers every week, is *Computerworld*, a weekly newspaper aimed primarily at larger computer users. Its companion publications include *Computerworld Office Automation*, *Computerworld On Communications* (each published semi-monthly) and a series of *Buyer's Guides* covering all major segments of the industry.

In addition, we publish *MICRO MARKET WORLD* for dealers, distributors, retailers and others involved in the microcomputer marketplace. For microcomputer users, we publish *InfoWorld*, *Microcomputing*, *PC WORLD*, *80 Micro*, *inCider*, *Run*, and *Hot CoCo*.

No one in the world publishes more computer information for more people in more countries than we do. And we'd be happy to give you more information on any of our publications. Just send a telex to our U.S. offices, attention CW International Marketing Services, (telex #95-1153) or write us at the address below.

CW COMMUNICATIONS/INC.

Ven-Tel Micro Modems Bow

SANTA CLARA, Calif. — Ven-Tel, Inc. has introduced four modems designed for use with various personal computers, including the IBM Personal Computer and Personal Computer XT and the Hewlett-Packard Co. HP 150.

All four are autodial, autoanswer, 1,200 and 300 bit/sec and are designed to run with varied software packages, including Microstuf, Inc.'s Crosstalk-XVI.

The modems are the PC Modem Half-Card, PC Modem 1200, HP Internal Modem and 1200 Plus.

The PC Modem Half-Card reportedly was designed to fit in the small expansion slot on the Personal Computer XT, leaving a standard slot for additional memory or other peripherals, and to fit in any slot of the Personal Computer. The system reportedly features automatic dialing and logon, terminal emulation and automatic data capture. It is priced at $549.

The HP Internal Modem is designed to fit into one of the HP 150 expansion slots and is reportedly compatible with HP software, including DSN/Link and PPC. It is priced at $425.

The PC Modem 1200 is said to be a full-size version of the PC Modem Half-Card, fitting in the Personal Computer, Personal Computer XT, Compaq Computer Corp. computers and Eagle Computer, Inc. computers. It reportedly will cost $499.

The 1200 Plus stand-alone smart modem reportedly features LED lights on the front to allow easy monitoring of the phone call and both a self- and a remote-diagnostic test. It is priced at $499.

The four modems will be available in January. Ven-Tel is located at 2342 Walsh Ave., Santa Clara, Calif. 95051.

Ven-Tel, Inc. 1200 Plus

Transmission Units Debut, Said to Cut Errors, Misuse

CHERRY HILL, N.J. — Datatel, Inc. recently announced two data security units said to protect against unauthorized data transmission over telephone lines and to eliminate transmission errors for users of asynchronous terminals.

The DCP4010 Originating Unit is installed at the remote site, between terminal and modem, and the DCP4015 Answer Unit is installed at the central site, between computer and modem, a company spokesman said.

Each unit is programmed with a four-digit code that must be matched by the two units at either end of the transmission link: the DCP4010 is programmed with four thumb-wheel switches, and the answering unit is programmed with four dual in-line package switches. Other features include a cyclic redundancy check for error detection and data retransmission and a 16K-byte buffer for storage and protection against buffer overflow, a vendor spokesman said.

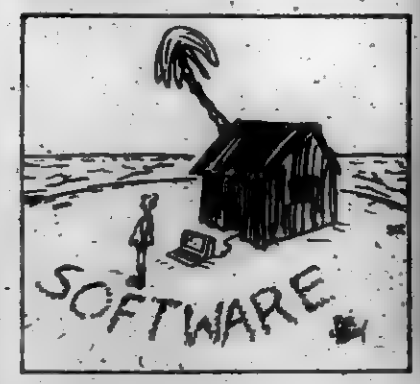
Pricing starts from $750 per unit from Datatel at Cherry Hill Industrial Center, Cherry Hill, N.J. 08003.

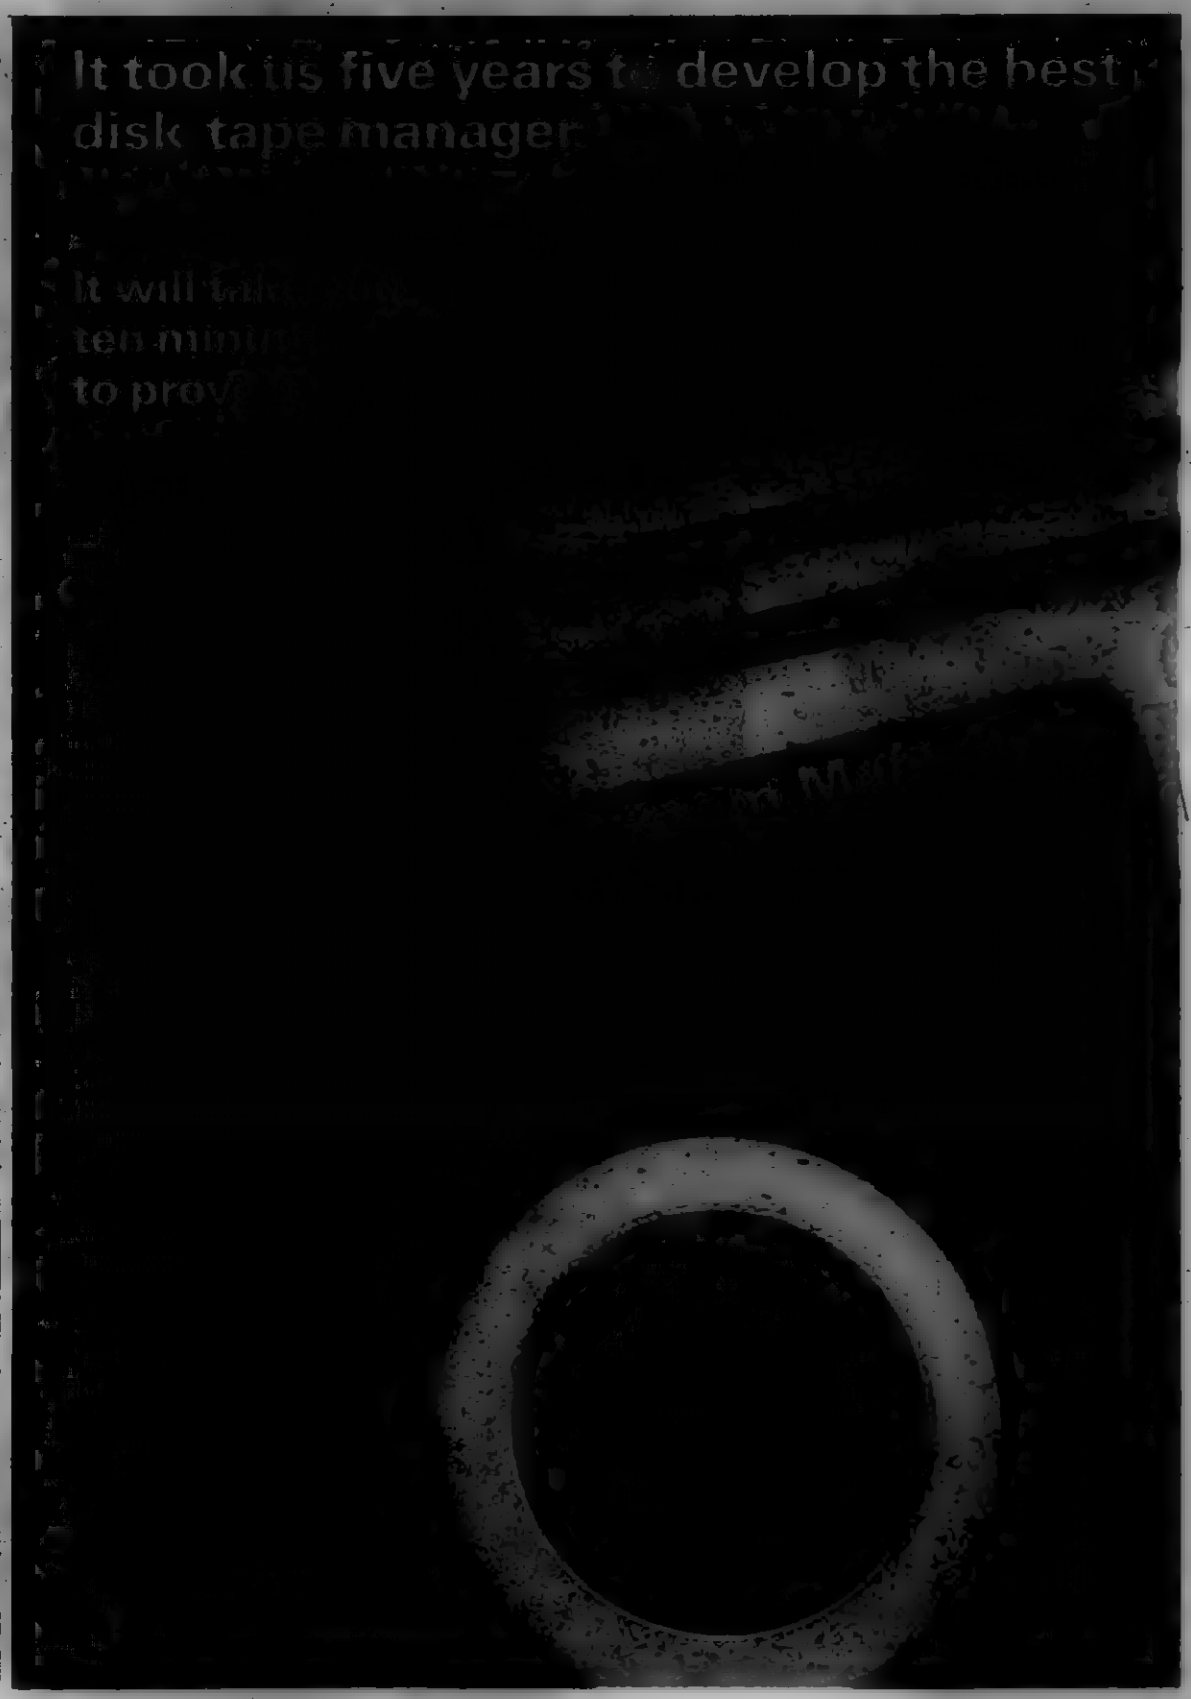
Cable Tester For Technicians Out For RS-232

SEATTLE — Datacom Northwest, Inc. has announced an RS-232 cable tester with a remote indicator for use on the bench or in the field by data communications technicians.

The Datacom RS-232 Cable Tester reportedly tests by two methods — the manual step mode or the continuous scan mode. Fifty LEDs are said to indicate connections on each end of the cable, while three more LEDs indicate open, short or continuity for each connection of the cable under test.

The device reportedly operates with the Datacom line of breakout boxes and pocket cablers. According to the company, the device will be available in January for $399. Additional information is available from Datacom Northwest, which is located at 11300 25th Ave. N.E., Seattle, Wash. 98125.





Modem Offers European Protocols

YOUNGSTOWN, Ohio — Western Datacom Co. has introduced an autoanswer, autodial modem that is said to enable any computer to telecommunicate with other modems located anywhere in the world.

Worldcom 200 is a standalone unit that uses the protocol of the country called, while maintaining compatibility with Federal Communications Commission (FCC) and Bell system standards for connections to the U.S. switched telephone network. The same RS-232C connection used for data also accepts dialing commands compatible with most half-duplex modems.

According to Western Datacom, the Worldcom 200 features FCC Part 68 registration with European protocols and tone or pulse dial on 1,200 bit/sec half-duplex lines or 300 bit/sec full-duplex lines. Operating modes include Bell 103/113, Bell 202, CCITT V.21, CCITT V.23 and videotex.

The price of the unit is $595 from Western Datacom, 5083 Market St., Youngstown, Ohio 44512.

Converters Eliminate Need for Leased Lines

HYANNIS, Mass. — Fibronics International, Inc. has introduced a pair of converters that use fiber optics between T1 modems or multiplexers, eliminating the need for leased telephone lines.

An FM-T1 converter translates into optical signals the 1.544M bit/sec bipolar T1 output and transmits the signals to the second FM-T1, which reconverts the information back to bipolar signals.

Prices for a pair of Fibronics FM-T1 fiber-optic converters start at $2,000. Delivery takes two to four weeks. More information is available from Fibronics International at 218 Main St., Hyannis, Mass. 02601.

Tektronix Offers Capability To 4115 Units

BEAVERTON, Ore. — Tektronix, Inc. has announced that its Autoconvergence capability is now a standard feature on all of the company's 4115 computer display terminals.

Autoconvergence is said to allow users to resolve the problem of color beams failing to intersect precisely at any point on a terminal.

Tektronix notes that beam convergence naturally drifts due to factors such as heat, position and equipment age, causing visual fatigue and loss of color information and images.

The 4115 terminal is priced at $19,950, according to the vendor.

More information is available from Tektronix, which can be contacted through P.O. Box 500, Beaverton, Ore. 97077.

Broadcast Scheduled For Feb. 9

WASHINGTON, D.C. — Tele-Update '84, a regulatory update for major telecommunications users, will be broadcast from here Feb. 9 to various teleconference locations around the country.

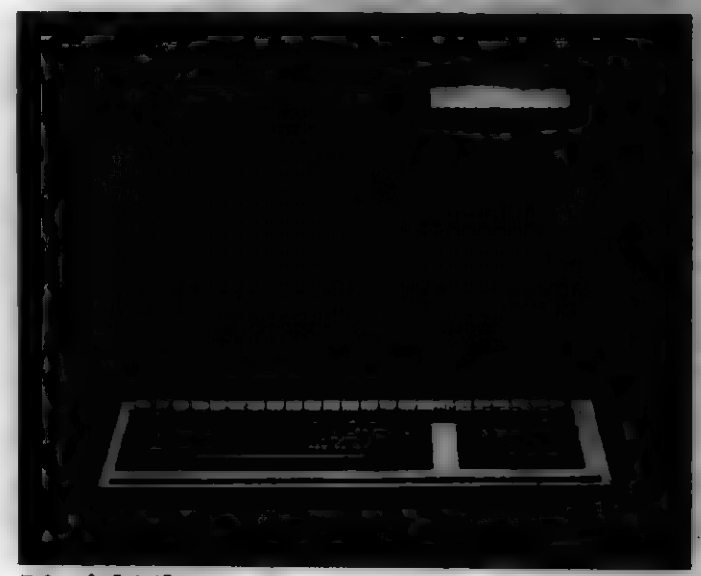
Sponsoring the conference is Jon Taylor and Co.'s Satellite Seminars.

The four-hour program tentatively is planned to include three panel discussions. The discussions will focus on topics such as: access charges, bypass systems and universal service, featuring participants from government agencies and Bell operating companies; deregulation of equipment and services, with representatives of the Federal Communications Commission, AT&T, other common carriers and the interconnect industry; and state regulation.

The program will feature two-way audio communications, according to the sponsors, and advance registration is priced at $75.

More information is available from Satellite Seminars through P.O. Box 356, Salt Lake City, Utah 84110.

CAN YOU FIND THE IBM* 3278 HIDDEN IN THIS PICTURE?



It's right there.

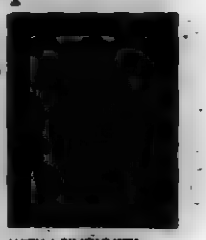
Inside the Advanced Personal Computer from NEC Information Systems.

In fact, the Advanced Personal Computer is the best personal computer for direct connect 3278 emulation, with 3274 and 3276 controllers.

Get the advantages of personal computing plus direct connect 3278 emulation.

With the APC, your people will be more productive than ever before.

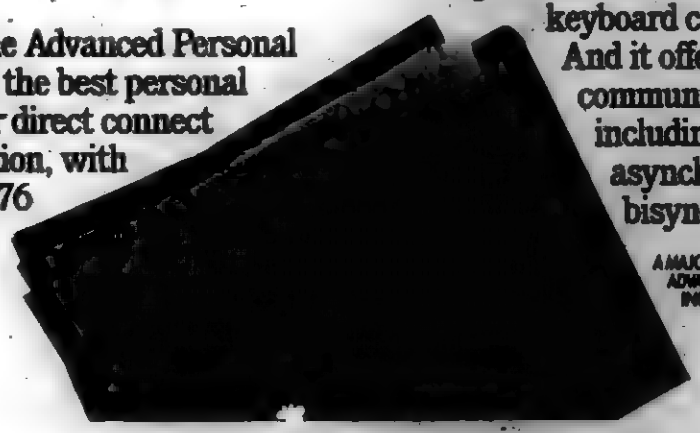
They can easily perform all their existing 3278 applications. Then, with a single keystroke, switch to a full function personal computer, quickly and easily.



WITH A SINGLE KEY-STROKE, YOU CAN SWITCH FROM 3278 EMULATION TO A FULL FUNCTION PERSONAL COMPUTER.

And the APC is fully compatible with all 15 different 3278 keyboard configurations.

And it offers a full range of communications protocols, including SNA/SDLC, asynchronous and bisynchronous.



A MAJOR INSURANCE COMPANY IS USING THE ADVANCED PERSONAL COMPUTER TO GREATLY INCREASE WORKER PRODUCTIVITY.

Prentice Announces Modem for Public Nets

SUNNYVALE, Calif. — Prentice Corp. has announced the 9600 A/B which, the company said, is a 9,600 bit/sec modem that functions over public-switched telephone networks.

The unit reportedly also operates over less expensive 3002-type unconditioned lines, and in leased-line operation, the 9600 A/B is compatible with CCITT Recommendation V.29. In both leased-line and public-switched network modes of operation, the unit conforms to CCITT Recommendations V.24 and EIA Standard RS-232C, according to the vendor.

The modem reportedly is designed for high-volume data communications between pairs of multiplexers in computer-to-computer data transfer applications or in medium-size to large networks. Said to be a compact desk modem unit, the 9600 A/B incorporates advanced large-scale integration for reduced power consumption.

The 9600 A/B is priced at $2,995 from Prentice, 266 Caspian Drive, P.O. Box 3544, Sunnyvale, Calif. 94088.

Seminars to Cover Micro Networks

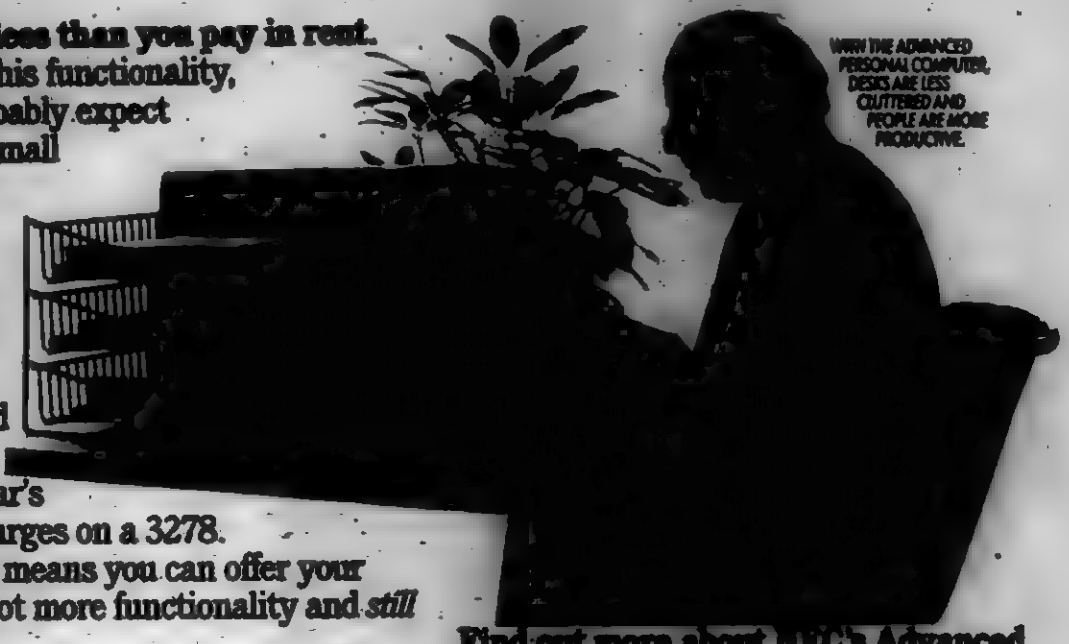
MINNEAPOLIS — Architecture Technology Corp. recently announced "Personal Computer Local Networks," a series of seminars to be held at five locations in March and April.

The seminars are set for: Phoenix, March 8-9; Atlanta, March 15-16; Minneapolis, March 22-23; Washington, D.C., March 29-30; and San Francisco, April 12-13.

The registration fee is $645. Architecture Technology can be reached through P.O. Box 24344, Minneapolis, Minn. 55424.

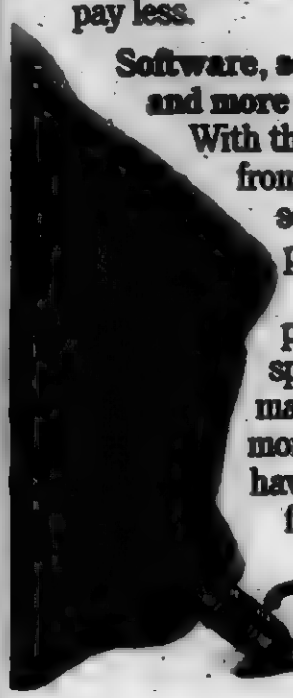
Own for less than you pay in rent.
With all this functionality, you'd probably expect to pay a small fortune for the APC. Surprise! The APC can be purchased for less than 1 year's rental charges on a 3278.

Which means you can offer your people a lot more functionality and *still* pay less.



Software, software, and more software.
With the APC, you can choose from hundreds of different software applications programs.

You can get word processing, forecasting, spreadsheets, database management and much more. In fact, we probably have a software program for any need you might have.



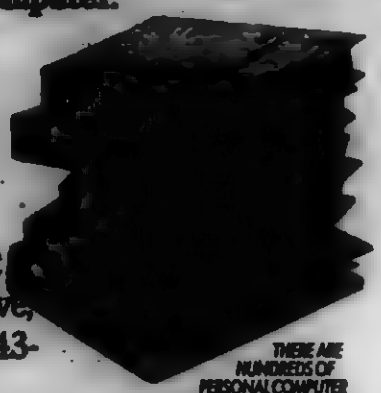
YOU CAN OWN AN NEC ADVANCED PERSONAL COMPUTER FOR LESS THAN THE COST OF LEASING A 3278 FOR 1 YEAR.

The APC also offers you the best color graphics in the industry, and a wide range of graphics software. The most storage capacity of any computer in its class. And the kind of reliability that NEC is famous for.

All for less than you're paying now.

*[illegible] is a registered trademark of International Business Machines Corp.

Find out more about NEC's Advanced Personal Computer.
For more information about the APC, or for the location of your nearest NEC representative, call 1-800-343-4419.



THERE ARE HUNDREDS OF PERSONAL COMPUTER SOFTWARE PACKAGES THAT RUN ON NEC'S ADVANCED PERSONAL COMPUTER.

And find out why so many 3278 users are saying "NEC and me".

NEC AND ME

NEC Information Systems, Inc.

Boxborough, MA 01719

Terminal Enhanced By Addition Of Graphics

ANN ARBOR, Mich. — Ann Arbor Terminals, Inc. has combined a graphics controller with its Ambassador terminal to offer an integrated alphanumerics/graphics terminal with high-resolution output.

The graphics controller processes industry-standard Tektronix, Inc.'s 4010-4014 codes with a resolution of 768 pixels by 600 pixels, the vendor said.

According to the company, the user has control of the mapping from program drawing area to viewport, the size and angle of the alphagraphic characters and numerous graphics modes, including polygon draw and fill.

Over 50 graphics control parameters may be specified through either a set up menu or commands.

Hard-copy graphics output to a dot matrix printer is standard, according to the vendor.

The alphanumeric features of the terminal reportedly include a 60-line display with vertical scroll and zoom, Ansi-standard coding, editing and formatting controls and RS-232C printer output.

Thirty-eight keys are programmable on 60 levels with any Ascii string.

Common graphics commands may be downloaded to the function keys to facilitate execution, the company noted.

Data line monitoring functions provide diagnostics for checkout of both alphanumeric and graphics output, according to the vendor.

Displays may be set up to contain alphanumerics only, graphics only, or a combination of both, the vendor said.

The Ann Arbor Ambassador graphics terminal package reportedly is available for $3,090.

Ann Arbor Terminals is located at 6175 Jackson Road, Ann Arbor, Mich. 48103.

Provides Centralized Data Base

Netman Ready for VM/CMS Sites

SANTA MONICA, Calif. — California Software, Inc. has announced that its Netman data center and data communications management system is now available for IBM VM/CMS environments.

Netman is said to provide a centralized and integrated data base and to allow a user to perform inventory control, configuration management, order tracking, problem reporting, vendor analysis, failure notification, financial management, invoice verification, budget preparation and change management.

Netman VM/CMS includes more than 30 on-line screen, extensive batch and on-line reports and interfaces with popular report writer systems. It is said to utilize a single server machine to manage data base access for an unlimited number of users.

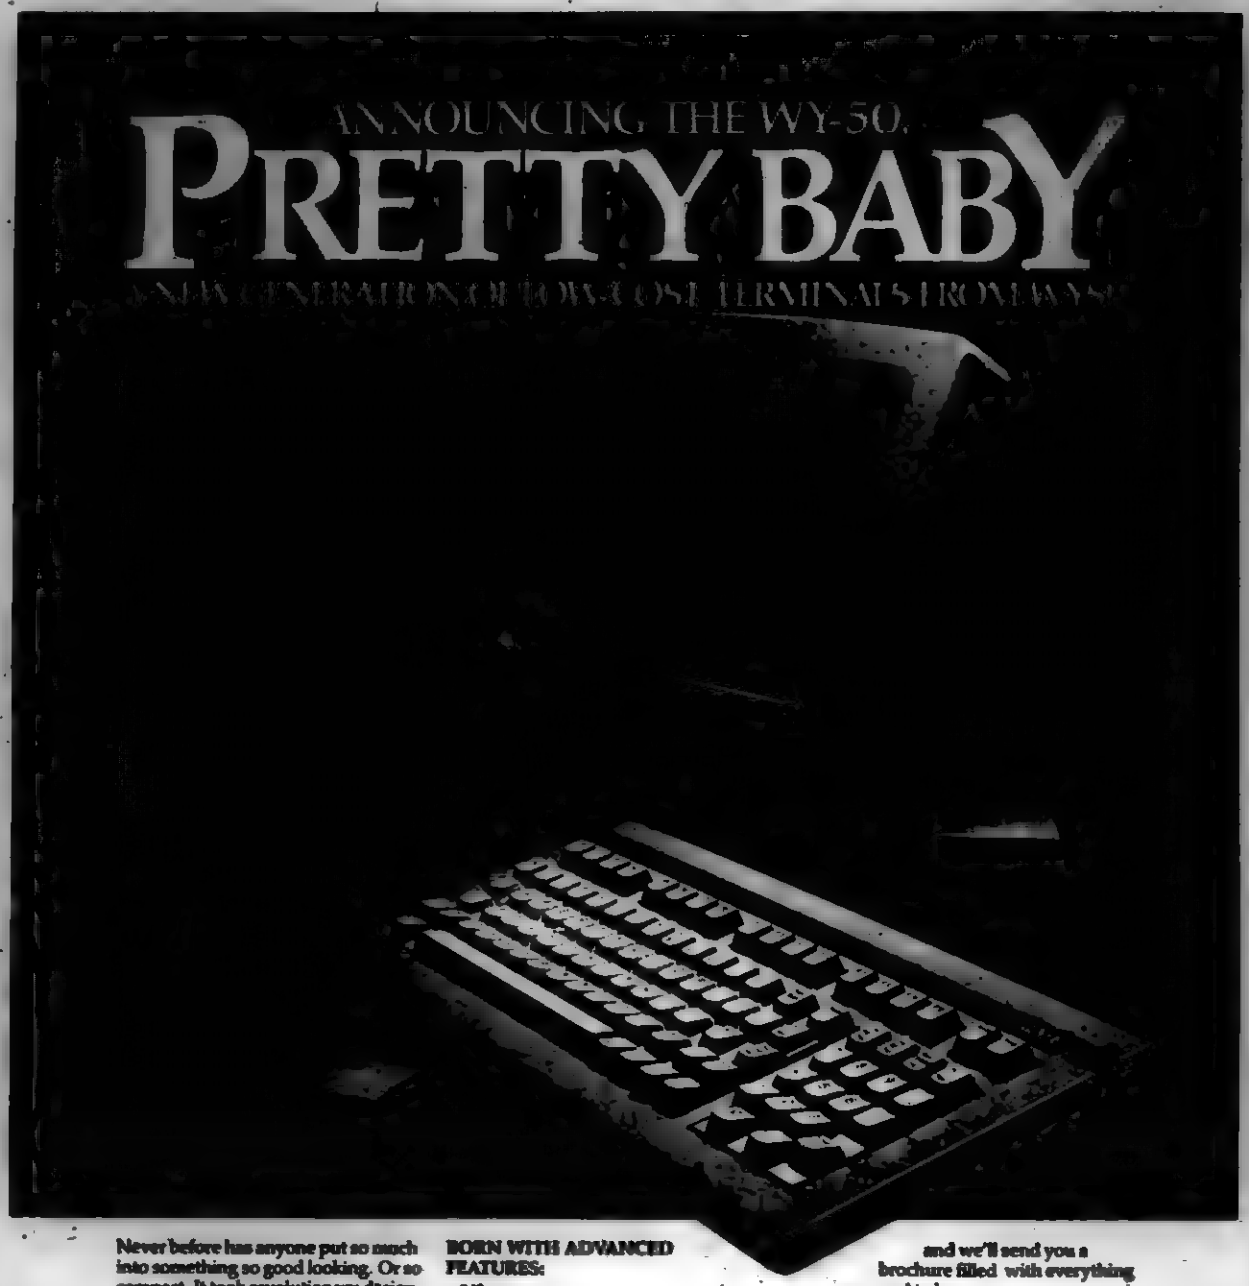
Netman VM/CMS is available now at an introductory license fee of $32,500 from California Software, 1460 Fourth St., Santa Monica, Calif. 90401.

IBM's PCjr Gets In-Board System

NORWOOD, Mass. — Microcom, Inc. has introduced an in-board communication system for IBM's PCjr.

Called Era 2, the system includes a 1,200 bit/sec modem and communications software. It incorporates the Microcom Networking Protocol for transfer of text or data files between personal computers and any other personal computer, minicomputer or mainframe. Era 2 also accesses remote data bases and utilities.

A free subscription to Dow Jones and an MCI Communications Corp. mail promotion are bundled with each Era 2 package. Priced at $429 per unit, the Era 2 carries a four-year warranty from Microcom, 1400A Providence Highway, Norwood, Mass. 02062.



Never before has anyone put so much into something so good looking. Or so compact. It took revolutionary design to do it. Design a lot of people couldn't accomplish for the price. But we did.

In fact, the birth of the WY-50 introduces a new standard for low cost terminals. It was conceived to give you 30% more viewing area. Developed to meet the most advanced European ergonomic standards. And best of all, delivered for a surprisingly low price.

The WY-50 sells for only $695.00.

BORN WITH ADVANCED FEATURES:
- 14" screen.
- 80/132 column format.
- Soft-set up mode.
- High resolution character.
- Low-profile keyboard.
- Industry compatible.
- Only $695.00.

For more information on the revolutionary design, outstanding features and unique good looks of our Pretty Baby, contact WYSE TECHNOLOGY and we'll send you a brochure filled with everything you need to know.

The WY-50. It's a real beauty.

Racal-Milgo Adds Omnimode 96 To Modem Line

MIAMI — Racal-Milgo, Inc. has introduced an addition to its Omnimode series of modems.

The Omnimode 96 reportedly operates at data rates of 4,800-, 7,200- and 9,600 bit/sec. The modem can reportedly be configured to operate with CCITT V.29 standards and for backward compatibility with the Racal-Milgo MPS 9601 or CMS 9601 modems. Test features for local and remote modems reportedly include standard tests, as well as CCITT V.54 loops.

Options on the modem include a Remote Modem Control and a multiport option for four-port operation, allowing data rates to be assigned in any combination of 2,400-, 4,800- and 7,200 bit/sec, according to a vendor spokesman.

The unit price for the Omnimode 96 ranges from $3,650 to $5,350, depending on the configuration. More information is available from Racal-Milgo at 8600 N.W. 41st St., Miami, Fla. 33166.

Ku-Band Tech Focus of Meet For February

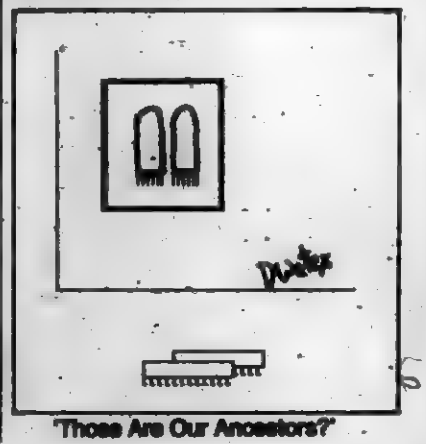
BETHESDA, Md. — Phillips Publishing, Inc. has announced a seminar to be held Feb. 16-17 in Washington, D.C., titled "Ku-Band Satellite Communications in the '80s."

The leader of the 1½-day seminar is Richard E. Wiley, former chairman of the Federal Communications Commission (FCC), one of the founding members of the law firm of Wiley, Johnson & Rein.

The topic of the seminar is the far-reaching impact which Ku-Band satellite technology will have on business and personal communications during the remainder of this decade.

According to the vendor, only one domestic Ku-Band satellite system is in operation, but the FCC has authorized an additional seven systems to be built and launched. The satellites are expected to have particular impact on business communications, because smaller earth station antennas for this band can be located on rooftops, making them accessible in high-density areas.

The price of the seminar is $595 per person. Phillips is located at Suite 1200N, 7315 Wisconsin Ave., Bethesda, Md. 20814.



"Those Are Our Ancestors?"

Compatible With IBM Personal Computer

Strategic Technologies Unveils Micro

ATLANTA — Strategic Technologies, Inc. has announced a briefcase microcomputer, the PC Traveler, which is software compatible with the IBM Personal Computer.

The unit weighs 28 lb and uses an Intel Corp. 80186 microprocessor. The PC Traveler uses Release 2.0 of Microsoft, Inc.'s MS-DOS operating system and features a 9½-in. diagonal ac gas plasma display with an 80-col. by 25-line format. The vendor claims to be the first to offer a micro incorporating a gas plasma display.

Other features of the unit include an integrated printer that can accept both letterhead and fanfold stationery. The printer can operate at 80 char./sec and print 80 or 132 char./line. Multiple print fonts, character sets and dot-addressable graphics are also supported.

The PC Traveler includes a 6.2M-byte cartridge disk drive. Conventional half-height diskette drives are also available, the vendor said.

The PC Traveler comes with 128K bytes of standard random-access memory, which is expandable to 256K bytes. In addition, the unit can be equipped with an internal modem.

Strategic's PC Traveler

The PC Traveler costs $4,495, Strategic Technologies said from 7001 Peachtree Industrial Blvd., Building 3, Norcross, Ga. 30071.

Microfilm Aid Ties Indexing, Addressing

KINGSTON, N.J. — Advanced Data Management and Intec Equipment, Inc. have announced Computer-Aided Retrieval (CAR) capability for the storage and access of microfilmed documents for their data base management software product, DRS.

This capability combines the indexing and rapid addressing features found in computer data bases with storage capabilities of microfilming. CAR was designed to be compatible with Digital Equipment Corp.'s PDP-11 minicomputers and VAX series superminicomputers and IBM's System 370, 4300 series and 30 series mainframes.

The price for CAR ranges from $15,000 to $52,000. Additional information is available from Advanced Data Management through 15-17 Main St., P.O. Box 601, Kingston, N.J.

Charles River Introduces Two Processors

FRAMINGHAM, Mass. — Charles River Data Systems, Inc. has added two 32-bit processors to its Universe line of superminicomputers.

Called the Universe 68/35 and the Universe 68/67, the units are based on the Motorola, Inc. 68000 microprocessor and incorporate a 32-bit Motorola Versabus I/O bus. The units also offer a 4K-byte cache memory, the vendor said.

The Universe 68/35 features a 5¼-in. Winchester disk drive with a formatted capacity of 35M bytes. The unit offers up to 3M bytes of main memory and can support up to 64 users. The 68/35 uses an integral 8-in., double-sided, double-density floppy disk drive for program loading and backup storage, the vendor said.

The Universe 68/67 uses a higher capacity 8-in. Winchester disk drive with a formatted capacity of 64M bytes. A built-in 45M-byte streaming tape drive is used for system backup. The Universe 68/67 comes with 512K bytes of main memory, which is expandable to 5M bytes, the vendor said.

Like other products in the Universe line, the 68/35 and 68/67 support the Unix operating system as well as Charles River's Unos operating system, the vendor said.

The Universe 68/35 including 512K bytes of main memory with byte parity checking, 35M bytes of Winchester disk storage and 1.25M bytes of floppy disk storage costs $14,900. Delivery time is 30 days, the vendor said.

The Universe 68/67 with 512K bytes of main memory, 64M bytes of Winchester disk storage and a 45M-byte streaming tape drive costs $24,900. The unit will be available in the first quarter of 1984, the vendor said.

Charles River Data is located at 983 Concord St., Framingham, Mass. 01701.

CDC's Subsystems Boast 18M-, 30M-Byte Storage

MINNEAPOLIS, Minn. — Control Data Corp. has introduced two 5¼-in. Winchester disk subsystems that offer 18M and 30M bytes of storage, respectively. The units can be used with microcomputers employing an IBM architecture.

Called the Storagemaster 518 and 530 subsystems, the devices will be available in the first quarter of 1984 at Sears Business Systems Centers and participating Computerland outlets, the vendor said.

Based on CDC's Wren disk drives, which previously were only available to OEMs, each subsystem includes a disk drive, power supply and fan. A single-board controller is supplied for installation, without adjustment, in the IBM Personal Computer processor unit, the vendor said.

The Model 518 costs $2,595 and the 530 costs $3,390, the vendor said.

In addition, CDC announced the Storagemaster Premium series of 5¼- and 8-in. flexible diskettes. The diskettes are offered with 48 or 96/100 track/in. densities with single- or double-sided recording. Storage capacities range up to 1M byte per diskette with various format options available. The diskettes are available in packages of 10 and cost approximately $45 to $65 per package, Control Data said from 2200 Berkshire Lane, Minneapolis, Minn. 55441.

Polo Workstation Debuts

MOUNTAIN VIEW, Calif. — Polo Microsystems, Inc. has introduced an integrated personal computer workstation that includes monitor, dual disk drives and modem.

The Polo system is supplied with a 128K-byte CPU, expandable to 768K bytes, a 12-in. color monitor and two double-sided, double-density, 5¼-in., 360K-byte disk drives. Memory can be expanded an additional 10M bytes with the hard disk option. Microsoft, Inc.'s MS-DOS and Digital Research, Inc.'s CP/M emulator operating systems are standard.

Priced at approximately $3,400, the system is available from Polo Microsystems at 2570 El Camino Real W., Mountain View, Calif. 94040.

Ricoh Releases Printers, Floppy, Plotter

FAIRFIELD, N.J. — Ricoh of America, Inc. recently introduced a number of peripheral products, including several types of printers, an IBM-compatible floppy disk drive and a four-color plotter.

Among the printers is the LP 4120, a tabletop laser printer that operates at 12 page/min. It weighs 112 lb and provides four interchangeable type fonts. The printer also features overlay and portrait/landscape conversion capabilities and can be interfaced to a variety of data processing and networking systems, the company said.

Ricoh's line of three serial impact printers features a double-daisy printing wheel and bidirectional printing. All of the printers accept optional forms tractor feeder, letter guide and cut-sheet feeder. The units range in speed from the 20 char./sec 1200N to the 40 char./sec 1500Q to the 50 char./sec 1600Q.

The Ricoh TP-X is a thermal printer capable of printing up to 100 char./sec. The 24-element printing head delivers an output resolution of 180 dot/in.

The RF8160, a half-size, 8-in. double-sided floppy disk drive, features double-density design that accommodates up to 1.6M bytes of storage. It is said to be compatible with a range of IBM units, including the 3740 and 32 drives, the 3600 and 4964 double-sided drives and System/34 drives.

Finally, Ricoh has introduced the GP-1, a four-color ballpoint pen plotter/printer for business and personal computers. At a printing speed of up to 120mm/sec, the GP-1 can print in black, blue, red and green ballpoint and felt-tip pen type. It features 26 plotter commands and an oil pen that is said to last 1,000 meters.

The LP 4120, which has a suggested retail price of $14,000, will be available from Ricoh in the first quarter of 1984. The serial impact printers will be available at the same time from retailer Hamilton/Avnet. Suggested retail prices are $900 for the 1200N, $1,800 for the 1500Q and $2,700 for the 1600Q. Prices for the TP-X, RF8160 and GP-1, which will be released in the second quarter of 1984, are not yet available. More information is available from Ricoh, 20 Gloria Lane, Fairfield, N.J. 07006.

Multimodel Desktop Operates As Stand-Alone Using CP/M

MINNEAPOLIS — Computer Designed Systems, Inc. has introduced its Adviser Micro Plus, a multimodel desktop computer.

The unit can communicate with the company's Adviser series of interactive microcomputers or operate as a stand-alone system using Digital Research, Inc.'s CP/M operating system. Accounting and word processing software is available, in addition to programs for graphics and electronic spreadsheets, the vendor said.

The basic system comes with an 80-col. printer and a 12-in. CRT terminal that displays 80 columns by 24 lines. Also included is one 5¼-in. disk drive. Storage capacity of the diskette drive versions ranges from 500K bytes to 2M bytes; optional hard disk storage is available, the vendor said.

A standard feature is a detachable 96-key typewriter keyboard with a 10-key calculator pad. Micro Plus is available in either monochrome or color versions, the vendor said.

The base price of Micro Plus is $2,000. More information is available from Computer Designed Systems, 10911 Olson Memorial Highway, Minneapolis, Minn. 55441.

Controller Joins DEC Processors, Industry Drives

GARDEN GROVE, Calif. — An emulating 5¼-in. floppy disk controller, said to feature Zilog, Inc. Z80-based design, is available from Distributed Logic Corp. (Dilog) for interfacing Digital Equipment Corp. LSI-11-11/23 Plus and Micro/PDP-11 processors to one or two 96 track/in., double-sided, double-density 5¼-in. floppy drives with industry-standard SA450 interface.

The Model DQ619 controller reportedly is contained on one dual-height printed-circuit board that includes all control and interface electronics for DEC RX02 disk drive emulation supported by DEC RT-11, RSX-11 and RSTS operating systems — without software patches or modifications.

The controller introduces dc motor control and includes 22-bit addressing for 4M-byte access, the vendor said. Other features include a full sector data buffer, on-board self-test and compatibility with DEC XII data reliability diagnostics.

The Model DQ619 costs $595 in quantities of 50. More information is available from Dilog at 12800 Garden Grove Blvd., Garden Grove, Calif. 92643.

Firm Announces RAM Board For IEEE-696 Bus

DALLAS — SDSystems, Inc. has announced the Expandoram IV, a random-access memory (RAM) expansion board for systems based on the IEEE-696 S-100 bus.

The product comes with 256K bytes of parity-checked memory. The board supports both 8- and 16-bit data transfers and may reside anywhere in the 24-bit address space of the IEEE-696 bus, the vendor said.

The Expandoram IV utilizes 150-nsec, 64K-byte dynamic RAM chips. The board is also designed to use 256K-byte RAM chips as they become available. The 256K-byte chip configurations yield a memory capacity of 1M byte, according to the vendor.

The Expandoram IV costs $1,145, the vendor said. SDSystems can be reached through P.O. Box 28810, Dallas, Texas 75228.

Disk Drive Series Targeted At OEM, Mini Markets

SANTA CLARA, Calif. — Memorex, Inc. has introduced a series of 8-in. Winchester disk drives with 166M bytes of storage aimed at the OEM small business computer and minicomputer markets.

The Memorex 230 series contains three models to match the storage requirements of small systems: Model 233 (83M bytes), Model 234 (1.1G bytes) and Model 236 (1.6G bytes). Each of the models has the industry standard storage module drive interface with a 1.2M byte/sec transfer rate, the vendor said.

The 230 series features 30-msec average access time with a switchable option that permits cartridge module drive interface users to integrate the drives without changing the interface.

The series permits 6.4G bytes of storage to be configured in the same space as a single 14-in. drive or 3.3G bytes in half the space, the company said.

Evaluation units will be available in January 1984, with production quantities available in March.

The Model 233 will be priced at $2,420, the Model 234 at $2,640 and the Model 236 at $3,080.

More information is available from the vendor, which is located at San Tomas at Central Expwy., Santa Clara, Calif. 95052.

FOR THREE DAYS IN TEXAS WILL TURN

No single computer, personal or otherwise, has so profoundly affected all of business and industry as the IBM Personal Computer.

And now, for three days only, you can see, touch, use and compare the hardware, software, peripherals and compatibles that run on, like or with this revolutionary machine. It's the PC *World Exposition* in Houston, and you are invited to join us.

You'll see hundreds of exhibits from all the product leaders. Both makers and marketers of hardware, software, printers, peripherals, add-ons and services in a giant exhibition and retail selling event. Here's a list of some of the product leaders you'll see:

Alpha Software Corp.

Shugart Offers Winchester Series, Microfloppy

SUNNYVALE, Calif. — Shugart Corp. has introduced a series of intelligent 5¼-in. Winchester disk drives that reportedly provide device independence from CPUs and a double-sided 3½-in., 1M-byte disk drive for desktop and portable computers.

The Shugart 700S series of Winchester disk drives, the 706S and 712S, are said to utilize intelligent small computer system interface controllers and half-height disk drives in an integrated, system-level product. The devices reportedly require only the connection of the drive to the host with the small computer system interface cable for integration.

The 706S is designed for a 5M-byte formatted capacity, and the 712S offers a 10M-byte formatted capacity. Both units reportedly have the intelligence to relieve the processor and controller of housekeeping functions such as formatting, data error detection and correction, defect mapping, data buffering, automatic retries and self-arbitration.

Shugart's latest microfloppy disk drive is the Shugart 350, which the company says occupies only one-fourth the volume of a standard 5¼-in. minifloppy drive.

The 350 reportedly operates with the Ansi working standard 3½-in. hard-shell cartridge media format, while providing 1M byte of unformatted capacity, 6-msec track-to-track access time and 80 tracks per side.

According to the company, the 350 may be incorporated into current systems with minimal impact on controllers and software investments and is quieter than minifloppies because it has only nine moving parts.

The 700S series and the 350 will be available for evaluation during the first quarter of 1984, with volume slated for the second quarter. The 350 costs about $200 in OEM quantities. The 706S costs $661, and the 712S costs $716 in OEM quantities.

Shugart is located at 475 Oakmead Pkwy., Sunnyvale, Calif. 94086.

Personal Computer Unveiled By Royal Business Machines

WINDSOR, Conn. — Royal Business Machines, Inc. has introduced a personal computer that features 64K bytes of random-access memory and the ability to handle programs written under Digital Research, Inc.'s CP/M operating system.

Called the Royal Alphatronic Personal Computer, the system is based on a Zilog, Inc. Z80A microprocessor and includes 32K bytes of read-only memory (ROM), consisting partly of Microsoft, Inc.'s Basic Interpreter. According to the vendor, the computer addresses a variety of professional business and tutorial applications.

Built-in interfaces connect a cassette recorder, two disk drives and a Centronics Data Computer Corp.-type printer. An RS-232C communications interface has also been included for connection of printers, modems and other peripherals.

Any color or black-and-white television or professional-quality red-green-blue monitor can be used with the Alphatronic system. Depending on the monitor, the computer can display either 80 or 40 columns by 24 rows, allowing the flexibility of a wide range of programs. The system's high character resolution is provided by an 8- by 12-dot matrix, and eight foreground and eight background colors can be selected.

Keyboard features include a built-in 79-char. keyboard with 6 double programmable function keys (Ascii layout), separate numeric key pad, separate cursor control keys, two oversize return keys, positive touch keyboard and card holder for key function references.

Options include a line of ROM cartridges, which plug into the top left side of the computer for optional game and tutorial software, and two disk drives — a 5¼-in., slim-line double-density drive with controller (320K bytes) and a 5¼-in., slim-line double-density drive without controller (320K bytes).

The price for the computer is $695 from Royal Business Machines at 500 Day Hill Road, Windsor, Conn. 06095.

Interface Cable Out From IQ

BELLEVUE, Wash. — IQ Technologies, Inc. has announced the SC8J7 Smart Cable, an RS-232 interface cable.

The product interconnects computer systems, terminals, modems, printers and other devices with an RS-232 interface. The cable connects handshake lines used in specific applications and functions at transmission rates of up to 19.2K bit/sec, the vendor said.

The price is $119.95, according to IQ Technologies, which is located at Suite 308, 11811 N.E. First St., Bellevue, Wash. 98005.

FEBRUARY, ALL EYES IN TO THE IBM PC.

Plus, we'll present personal computer experts from around the nation in an up-to-the-minute conference program. You'll learn how to choose and how to use the technology and equipment surrounding the PC family of microcomputers. Here's a partial listing of the conference sessions:

Wednesday, February 1, 1984
User Sessions:
The Benefits of the IBM PC for Small Businesses
Financing Options and Tax Advantages
Available Add-Ons and Peripherals
Software: What's Available and How to Find It
What Do the Compatibles Have To Offer?
How I Became Compatible With My IBM PC
Medical/Dental Applications for the PC
The PC in the Law Office
PC's and Real Estate
Manufacturing Resource Planning with the PC
Investment Software for the PC
CPA Software: The Bottom Line
Software for Insurance Applications
Distributed Control Software for the PC

Thursday, February 2, 1984
User Sessions:
The Anatomy of the IBM PC
Defining Levels of Compatibility Between Systems
Overview of Compatibles: Desktops and Portables
Word Processing Software
Database Management Software
Business Graphics Software
Analyzing Your Software Requirements
Overview of Major Business Applications Software
Integrated Software Solutions

Friday, February 3, 1984
User Sessions: The PC in the Corporate Environment
Review of Policy and Planning Issues
Implementation Strategies
Use of PC to Mainframe Communications (Includes Security Issues)
Local Networking for the PC

Quite simply, the PC *World Exposition* is the biggest event in Texas for the most important computer in history.
Don't miss it.

FREE ADMISSION to one Conference Session of your choice. Just present this coupon at the Registration Desk any day of the Show, pay the regular $10 exhibits only admission and choose any one Conference Session free of charge. One coupon per person.

The PC World Exposition
Houston
February 1-3, 1984, Astro Hall

SAVE $5.00 on Full Exhibit & Conference Admission. Present this coupon at the Registration Desk and pay just $25.00 for a Conference Pass entitling you to attend all Conference Sessions and three days of exhibits. One person per coupon.

IT'S WHAT THE WORLD IS COMING TO.

The PC *World Exposition* is produced by Mitch Hall Associates
in cooperation with CW Communications, Inc., publishers of PC World, MICRO MARKETWORLD, InfoWorld, and Computerworld.

Three-day admission to all exhibits and conference sessions is $30.00. Admission to the exhibits only for three days is $10.00. Show hours run from 10:00 AM to 5:00 PM Wednesday and Thursday, February 1 and 2, and from 10:00 AM to 3:30 PM on Friday, February 3. Conference sessions run from 8:30 – 10:30 AM and 1:30 – 5:30 PM on all three days.
For speaker and conference information, call CW Communications at 1-800-336-4880.
For information on exhibiting, call Mitch Hall Associates at 1-617-369-7401.

MCBA introduces shrink-to-fit software.

With nine years in minicomputer software, 15,000 installations worldwide and an established reputation in the mini world, MCBA is proudly shrinking its software line.

Down to micro size.

We've taken the impressive power of minicomputer software and made it available for micros. Right now.

Alter the fit? Absolutely.

Alter the functionality, modularity and capability? Not one bit…so to speak.

This new line of serious microcomputer software is by far the most comprehensive, well-tested and sophisticated in the industry today. By whose standards? Thousands of MCBA users who rank it the best in the business.

MCBA's library of 16 integrated manufacturing, distribution and accounting packages can be installed in whatever combination

nd sequence a user eeds for his or her usiness.

It grows with businesses. No matter what size they are now. Or want to be later.

And MCBA software now runs in RM/COS,® UNIX™ and UNIX look-alike environments.

In other words, we've tailor-made our newest software to fit micros—as comfortably as it fits user needs.

So whether you're a dealer or a user, find out about it. Call us now at (818) 957-2900.

Shrink-to-fit software. For growing businesses.

MCBA®

Minicomputer Software for Micros.

RM/COS is a Registered Trademark of Ryan-McFarland Corp. Unix is a Trademark of AT&T. MCBA is a registered trademark of MCBA, Inc.

Bits & Pieces

Two Nonstop Power Units Designed for Applications

DALLAS — Bits Power Systems, Inc. has announced two uninterruptible power supplies (UPS) for computer applications requiring dedicated, continuous and isolated electrical power.

According to the vendor, the units are always on-line. Utility line power is used only to maintain a full charge on the internal gel-type batteries.

Model UPS-200 and UPS-400 have visual, audible and remote alarm functions. Standard full load backup time from internal batteries is 10 minutes. External 12V batteries may be plugged into a connector for extended backup time and automatic charging, the vendor said. Four standard grounded output receptacles are provided.

UPS-200 (200W) measures 5-in. high by 13-in. wide by 16-in. long and weighs 35 lb. Model 400 (400W) measures 6-in. high by 16-in. wide by 18-in. long and weighs 55 lb.

The price for the UPS-200 is $795 and $995 for the UPS-400.

Further information is available from Bits Power Systems, Suite B114, 11020 Audelia Road, Dallas, Texas 75243.

Plug-In Security Module, Software Back IBM Micros

ANNANDALE, Va. — Advanced Computer Security Concepts, Inc. has announced a plug-in module and associated software that will prevent unauthorized disclosure or modification of confidential or proprietary data on the IBM Personal Computer or Personal Computer XT.

The module contains a Zilog, Inc. Z80 microprocessor, 4K bytes of random-access memory, a minimum of 2K bytes of erasable programmable read-only memory, buffers and flags, a software implementation of the Data Encryption Standard, interface software and data protection software that enciphers all data residing on a diskette or hard disk. The data is deciphered only after being loaded into the memory and is again enciphered before being written back to the disk file, the vendor said.

The system operates under IBM PC-DOS Release 2.0 and costs $795. Further information is available from Advanced Computer Security Concepts, 4609 Logsdon Drive, Annandale, Va. 22003.

Desktop Chubb-8900 Offers Security Manager System

TORONTO — Chubb Engineered Systems has announced the desktop Chubb-8900, a computer-based security management system.

The unit can be handled by one operator and performs a variety of control/command functions, such as recording and controlling access via card readers, monitoring doors and intruder detection devices and signals heating, ventilation and air conditioning abnormalities. It can also unlock doors, turn lights on and off and sound required signals at prescheduled times or in response to specific conditions, the vendor said.

The system can handle 32 card readers, 5,000 pass cards and provide monitoring and command functions for 1,000 individual zones.

Prices begin at $35,000 and vary according to the size and complexity of the application, the vendor said.

Further information can be obtained from Chubb Engineered Systems at 80 Horner Ave., Toronto, Ont., Canada M8Z 4X9.

Storage Control Device Simplifies Winnie Use

SAN JOSE, Calif. — Priam Corp. has introduced an intelligent storage control device designed to simplify integration of Priam Winchester disk drives into multiuser computer environments.

The Delegate DS201 reportedly manages combinations of up to four 5¼-in., 8-in. and 14-in. Winchester disk drives with data rates of up to 1.8M byte/second has ports for ¼-in. tapes and floppy disks.

It contains an autonomous microprocessor with its own memory and I/O controllers, allowing it to delegate operations with minimal host involvement.

The DS201 is the second Delegate-series control device. It offers the ANSC Intelligent Peripheral Interface rather than the Smart-T interface of the earlier DS101.

The unit will be available during the first quarter of 1984 at a price of $975 in OEM quantities.

Priam Corp. is located at 20 W. Montague Expwy., San Jose, Calif. 95134.

Digital Optical Disk Drive Fits OEMs, Integrators

PARIS — Thomson-CSF Communications has announced the Gigadisc GD 1001, a read/write digital optical disk drive for OEMs and systems integrators.

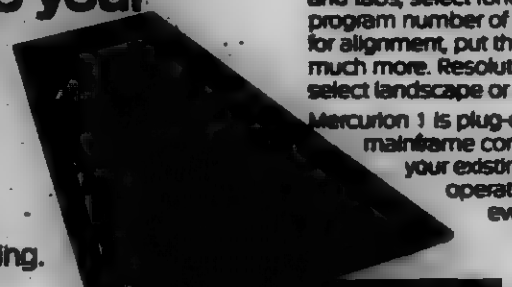
The product is capable of storing 1G byte of formatted data on a single-sided, 12-in. optical disk. The unit is available in both a 19-in. rack-mountable version and a stand-alone tabletop unit, the vendor said.

The unit costs between $6,000 and $9,000 and is currently available in OEM quantities, the vendor said.

Thomson-CSF can be reached at 23 Rue de Courcelles, Bureau 8.02, BP 96-08, 75362 Paris Cedex 08, France.

Mercurion 1

The page-per-second non-impact printer matched to your computer



...and priced to change all your thinking.

Now Mercurion 1 makes non-impact printing as cost-effective as it is performance-effective. Revolutionary ion deposition imaging—far simpler and more reliable than laser xerography—gives you letter quality printing, and on standard 8½ x 11 paper now demanded by government and most businesses. All of this, plus 5,280 lines-per-minute.

At an initial cost less than 50% that of conventional non-impact printer systems, Mercurion 1 also substantially reduces maintenance costs, downtime, and per-page operating costs. And does it quietly (55dBA).

A simple, user-friendly control panel lets you set margins and tabs, select fonts (up to 8 styles and sizes), program number of copies (1 to 255), feed a single sheet for alignment, put the system through self-test, and much more. Resolution is 240 x 240 pixels, and you can select landscape or portrait orientation.

Mercurion 1 is plug-compatible with all popular mini- and mainframe computers. It's designed to replace your existing impact line printer directly—no operating system software changes. We even supply the cable.

And you can count on SSI quality and service support. Thousands of our printer systems are in use worldwide.

Call us or mail the coupon below for a fully-detailed brochure on this great new printer system.

Soup up your Volkswriter.

Everybody knows Volkswriter, the word processing software package that's become synonymous with high performance. Now, there's a way to get even higher mileage out of your Volkswriter. Hook it up to a Dataproducts P Series dot matrix color printer.

The versatile P Series translates the executive class, word processing capabilities of the Volkswriter into brilliant full color charts, graphs and text. It delivers a full page of text quality print in nothing flat while its sheet feeder automatically prevents loading hassles. And the P Series uses pin feed or plain paper and has the brains to fill every appropriate line with crisp, sharp copy, even if it has to justify to do it. And the P Series color printer has dual speed capability for correspondence quality output for the Volkswriter's many word processing applications and high speed output for draft and spreadsheets.

The Dataproducts P Series color printer. Think of us as a supercharger for your Volkswriter.

For more information go to your nearest computer store and ask about the Dataproducts P Series color printer, or call Dataproducts, 1-800-258-1386.

As Info Equipment Proliferates

Flexibility Called for in Integrating OA

By Lynn Haber
CW Staff

FRAMINGHAM, Mass. — The critical role of communications for major business productivity gains has come to the forefront as the shift in office automation moves away from a fragmented approach toward a more integrated approach, according to a recent report published here.

"In present and future office environments, the nodal points for the communication of information will include workstations, computers, file servers, printers and other peripherals, personal computers and other types of equipment, as well as telephones and memos on paper. The ability to link all of these requires more flexible and more fully connective communications methods than those used in the past," according to "Office Networks," prepared by International Data Corp. (IDC).

The report praised the broad range of information processing equipment available to meet the changing office automation needs, but cautioned against this great flux which has resulted in a lack of standards in an environment of rapidly changing technology.

"With the availability of newer networking solutions for office communications comes the promise of higher level, cost-effective applications to support the automated office of the future. However, with this promise, some confusion exists," according to the report.

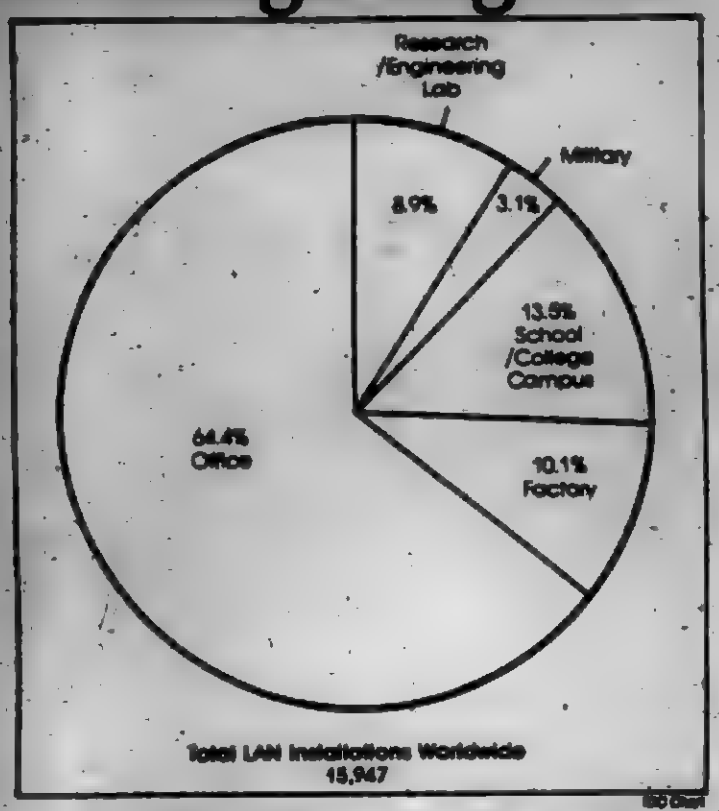
In the course of the study, IDC examined user needs and considerations for planning to implement an office communications network. Two important networking options explored were local-area networks and the voice/data private branch exchange (PBX).

According to the researchers, there are currently some 15,960 local-area networks of all types installed worldwide, with 64.4% of these in the office (see chart). The number of local-area networks installed worldwide is expected to reach 103,210 by the end of the year 1988.

The study also predicted an emergence of the PBX as a means of office networking. A number of third- and fourth-generation voice data PBXs have already become available, and these are expected to compete against local-area networks.

One constant theme throughout the report is the need for careful planning of an office network before any discussion of technology takes place. "The network in place should support the desired applications, not dictate what applications are possible. The best office network is the one that satisfies present, as well as future, business requirements," the report said.

The report is available for $3,500 from IDC, which may be reached at Five Speen St., Framingham, Mass. 01701.



Type of Premises With Local-Area Net Installation

HP Package Provides Networking For Its 9000

PALO ALTO, Calif. — Hewlett-Packard Co. recently announced a network package to provide local-area networking among its HP 9000 32-bit computers running under HP-UX, the company's version of the Unix operating system.

The HP LAN 9000 reportedly connects Series 500 computers via an Ethernet-compatible 10M bit/sec link and is said to allow users with little or no data communications knowledge to gain access to files, transfer files within a network, start or stop processes on other systems in the network and automatically communicate between processes running simultaneously.

The system is comprised of a microprocessor-based local-area network unit linked to a host HP 9000 computer through a dedicated HP-IB interface, a company spokesman said.

The network unit is connected to a 10M bit/sec coaxial cable, and software from the host is downloaded to the network unit to handle the transfer of information from the computer to other computers on the network via a transceiver and a cable, according to the vendor spokesman.

The package is priced at $5,035, and delivery is estimated at eight weeks after receipt of order. More information is available from Hewlett-Packard, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

Inconix Local-Area Net Connects to IBM Micro

NATICK, Mass. — Inconix Corp. has introduced a local-area network that can be used for direct connection to the IBM Personal Computer via an RS-232 link.

The Cinchnet network provides for access by up to 124 Cinch Pac primary automation control units over a distance of 4,000 ft at a speed of 28.8K bit/sec without the need for polling, the company said. Each Cinch Pac offers local control intelligence for stand-alone operation without control instructions from or intervention by a host computer, a spokesman for the firm pointed out.

The combination of Cinch Pac with the Personal Computer via the network reportedly provides distributed digital control capability at a cost of about $1,000 per loop.

More information on the local-area network is available from Inconix, which is located at 10 Tech Circle, Natick, Mass. 01760.

DG Offers Amber Screen

WESTBORO, Mass. — Data General Corp. has announced that its Dasher Model D210, D211, D410 and D460 workstations are now available with an amber video screen.

Said to be compatible with earlier green-phosphor Dasher models, the workstations can reportedly be used with existing applications, including Data General's Comprehensive Electronic Office (CEO) system.

The CEO package consists of word processing, information management and decision support products. The price for the amber monitors ranges from $820 to $1,610. DG can be reached at 4400 Computer Drive, Westboro, Mass. 01581.

Corvus Out With E-Mail, Software

SAN JOSE, Calif. — Corvus Systems, Inc. has announced an eight-program integrated software package for its Corvus personal workstation and an electronic mail package for various personal computers.

The Corvus Isys software package reportedly integrates a word processing package, a 225-row by 127-col. spreadsheet, business graphics, list management, data communications, sorting, rapid information retrieval and desk tools.

Corvus Isys allows the user to transfer data between programs and among computers using the Corvus Omninet local-area network. Computers on the network reportedly can share numerical data, standard text paragraphs or lists from common mass storage systems.

Corvus Omnimail is available for various personal computers, including those from Corvus; Apple Computer, Inc.; IBM; Digital Equipment Corp.; and Texas Instruments, Inc. It reportedly manages network mail traffic and allows users to track correspondence, edit, file and distribute messages and data parcels to several locations.

Corvus Isys, available now, and Omnimail, set for delivery in the first quarter of 1984, are priced at $495 each from Corvus Systems, 2029 O'Toole Ave., San Jose, Calif. 95131.

To Increase 270% in '83, Report Says

Floppy Drive Shipments Skyrocketing

MOUNTAIN VIEW, Calif. — Worldwide shipments of floppy disk drives in 1983 will total an estimated 5.5 million units, up a whopping 270% over 1982's shipments, while growth to 23.6 million units shipped is expected by 1986, according to a recently released report from Disk/Trend, Inc.

The report showed further that a surge in 1983 shipments has made two-sided, 5¼-in. minifloppies the dominant flexible disk drive configuration. The trend to half-high versions of 5¼-in. drives is well established, the report found, especially with two-sided models from the Japanese manufacturers.

Considering worldwide unit shipments of all minifloppy drives, more than 90% of two-sided drives and more than 60% of one-sided drives will be half-high models by 1986, the study reported.

In addition, Disk/Trend's annual survey found that IBM is expected to start internal production of two-sided, 5¼-in. floppies next year with a program that will increase to production of an estimated 1 million drives in 1986.

However, the company's consumption of minifloppies by that time will be so great that IBM will likely buy as many minifloppies as it manufactures, the report said.

IBM's Plans for Drives

The report also noted that IBM will start using 1.6M-byte, 5¼-in. drives on new models in its Personal Computer line, which will supersede older word processing and small business systems. This will stimulate IBM's competitors to use compatible floppy drives, creating an active market in the U.S. for the 1.6M-byte format, originated in Japan.

This format will capture more than one-quarter of the 1986 shipment level of two-sided, 5¼-in. drives, the study said.

Other findings of the survey included:

- Despite continued confusion over competing microfloppy standards and stern competition from half-high 5¼-in. drives, microfloppies are starting to reach significant production quantities, with next year's worldwide shipments up to 810,000 units and shipments of more than three million expected by 1986.
- Worldwide shipments of 8-in. floppies are flat at present, with a slight growth for two-sided drives offset by declines in shipments of one-sided drives. After 1984, shipment declines of more than 10% (20% in 1985) are expected for drives in this category.
- For the first time in 1982, a different company held leadership in worldwide OEM shipments in each of the product groups analyzed. Tandon Corp. led in two-sided, 5¼-in. market share with 38%, and Shugart Corp. led in the one-sided, 8-in. market with 63%.

The study, prepared by James N. Porter, includes information on individual revenue and unit shipment projections for flexible disk drives in five separate product groups and provides statistics and analysis on installed drive populations, average OEM selling prices, competitive market shares of manufacturers and a basic review of competing data storage technologies.

The report also contains basic specifications of 285 flexible disk drives and profiles on 57 manufacturers of flexible disk drives worldwide.

The report is priced at $675 from Disk/Trend, located at 1224 Arbor Court, Mountain View, Calif. 94040.

Worldwide Flexible Disk Drive Shipments

Distribution Of Software Electronically Fast Growing

By Lisa Raleigh
Special to CW‡

Electronic distribution of software is more than a probability favored by futurists. It's happening now, but is viable only for game software and other small programs at this time.

The potential for electronic distribution of business software will not be realized for many months and possibly years, according to industry analysts. Because business programs are so much larger than games, and because they require a great deal more support, many issues remain to be resolved.

It is already possible to download software from a central source via a modem to a retail store or even to an end-user location. However, the transmission of large programs requires a sizable chunk of time, sometimes more than an hour. Dealers wonder if their customers will sit still longer than 10 minutes waiting for a program to download.

Even if speed were not an issue, documentation and support remain untransmittable. An exception is on-line documentation, but that only makes large programs larger still. Also, even if big programs

Xerox Merges Versatec, Office Products Division

LOS ANGELES — Xerox Corp. has announced the consolidation of two corporate organizations into a new division of the company and the appointment of a divisional president, according to Robert Adams, group vice-president and president of Xerox Systems Group.

The new Information Products Division will combine the resources of Versatec, Inc., a Xerox company in Santa Clara, Calif., and the Xerox Office Products Division in Dallas, where the new division will be located.

Named to head the Information Products Division is Renn Zaphiropoulos, president and co-founder of Versatec Co., who will retain his Versatec responsibilities and assume direction of three business units and staff functions in the former Office Products Division.

The three business units are electronic typing, information processing/personal computing and telecopiers, the company said.

In addition to Versatec's electrostatic printer and plotter line of equipment, the new division's products will include Xerox's Memorywriter typewriters, 860 information processing system, 820-II and 16/8 personal computers and 295, 455, and 495 Telecopier facsimile transceivers.

William C. Jackson Jr., former president of the Office Products Division, will join the Dallas-based Genra Group, which recently acquired Xerox's computer retail stores, as president.

Tandy's Model 2000 Seen Impacting IBM's Plans

By Jeffry Beeler
CW West Coast Bureau

With the recent announcement of its Model 2000 microcomputer, Tandy Corp. has gained a "temporary advantage" over IBM in the crowded IBM-compatible personal computer field and will force the industry giant to strengthen its next move in the personal computer arena.

That assessment of the Tandy machine's market impact comes from industry analyst Robert Fertig, president of Greenwich, Conn.-based Enterprise Information Systems, Inc.

In response to Tandy's first IBM-compatible micro, Big Blue will probably add extra technological muscle to its long-rumored Popcorn Personal Computer, which Fertig envisions as a multiuser workstation incorporating a 32-bit Intel Corp. 8286 microprocessor.

The announcement of Tandy's Model 2000 has, in Fertig's view, also "pulled the rug out from under" Sperry Corp. and "completely neutralized" the latter company's own IBM-compatible micro only days after its formal debut at the Comdex/Fall '83 show [CW, Dec. 5]. The Sperry 16-bit machine incorporates a 7.16MHz Intel 8088-2 and boasts a 50% greater

Outpaced.

This DP department doesn't have the skills to stay ahead of new hardware/software developments. DELTAK CAN HELP.

As the pace of technology keeps changing, even seasoned staffers find their skills are falling behind. Meanwhile, applications backlogs are skyrocketing. And in most companies, there's no sign of a departmental staff-up in sight.

That's the problem. So what's the solution?

It all starts with training. You see, a properly planned DP training program can help personnel gain the practical knowledge they need to stay up-to-date. It can also ease applications backlogs by boosting productivity.

And proper training starts with DELTAK. We offer over 800 multimedia and computer-based courses for all levels of MIS professionals, from COBOL programming to database management. And since we're the world's leading DP educator, we can show you the latest ways to keep your people informed and productive.

For all the facts, call or write DELTAK today. And watch the pace pick up right away.

Local Nets Can't Aid Corporate User

Software Publisher Bemoans Lack of Micro Tools

By Robert Batt
CW West Coast Bureau

SAN DIEGO — The computer industry has created hundreds of thousands of "first-time losers" because of inadequate microcomputer software, an industry expert claimed recently.

Hal Tilbury, president of Bluebird Systems, Inc., a Carlsbad, Calif.-based software publisher, charged that the lack of powerful software means local-area networks are unsuited to the needs of today's corporate user.

"A first-time loser is one who soon discovers that what he bought won't do what he wanted, and disillusionment quickly sets in," Tilbury said here during a work session at the Multi-User Systems and Local Networks Forum, sponsored by Future Computing, Inc.

In large part, it is the computer industry that is to blame, he continued. "We blitz the buyer with Madison Avenue advertising campaigns that make micro-based software sound as if it is just as sophisticated as that found on a mainframe. We sell software designed for personal use to a business without taking the time to determine if it can do a job that it was never really designed to do."

Tilbury said local-area networks are not suited to provide the kind of transaction processing environment required by business data processing users.

What a business needs, he asserted, is the ability to do transaction processing from a centralized common data base, constantly and instantly available to the people in the organization who have a need to know. The user of the system must be allowed to initiate any job from any workstation at any time, and the software available has to be powerful and flexible enough to do the job, he added.

"No wonder the user became a loser. We didn't have the software he needed," Tilbury proclaimed. "The available micro-based software is all oriented to personal computing or support of a single-user work session and just does not match up to the user's needs."

'A first-time loser is one who soon discovers that what he bought won't do what he wanted, and disillusionment quickly sets in.' — Hal Tilbury, president of Bluebird Systems, Inc.

Local-area networks were not designed to accommodate transaction processing, Tilbury said. Rather, they were created out of the desire to allow several micros to share expensive disk and printer resources and to communicate with each other. While excellent for individual work session tasks such as word processing, graphics and spreadsheet analysis, local-area networks still do not fit the corporate bill.

Tilbury described local-area networks as too slow and expensive for the business environment. They cannot efficiently accommodate a common shared data base and cannot really handle true record-locking or file-sharing functions, he complained.

Furthermore, he said, the software used by local networks is Digital Research, Inc. CPM- or Microsoft, Inc. MS/DOS-based and consequently has been written for a single-user approach.

"Generally speaking, the most successful microcomputer software was written to accomplish a narrowly defined specific purpose. This has not been done with most micro-based operating systems, which have tried to be all things to all people."

Wang Offers Vision Support

SAN JOSE, Calif. — Wang Laboratories, Inc. has joined a growing list of computer makers offering support for Visicorp's Vision, the company's integrated operating environment product.

Wang and Visicorp have inked an agreement giving Wang exclusive marketing rights to Vision applications manager and related Vision software applications for Wang's personal computer. The agreement specifies that Wang will be responsible for the distribution, licensing and promotional activities associated with the marketing of Vision on Wang's micros.

In November, Visicorp reached a similar agreement with IBM for distribution of Vision on the IBM Personal Computer XT. Other computers that will support Vision include Compaq Computer Corp.'s Plus; Texas Instruments, Inc.'s Professional Computer; Honeywell, Inc.'s 7900 system; and Eagle Computer Corp.'s Spirit and PC Plus.

Our giant commitment to OEMs

BOARDS TO SYSTEMS.

YOU NAME IT.

CIE Systems is committed to being your source for the very latest in micros and all that goes with them.

The micros are the CIES 680™ Business Computers with the advanced 32/16-bit 68000 microprocessor and Intel's Multibus™ architecture. So from boards to systems, you can easily configure your product line for virtually any business.

There are four 680 models. The 680/30 (shown above), 680/20 (on the right), 680/35 and the 680/40.

The 680/30 and 680/35 will accommodate up to eight interactive users. The 680/20 expands to four users. And the 680/40 expands to as many as 20 users.

Disk capacities range from 10 to 300 Mbytes, memory from 256K to one Mbyte.

Operating systems include REGULUS™ (UNIX™ compatible) and RM/COS.™

Language processors include BASIC, FORTRAN, COBOL and PASCAL.

Applications offered are general accounting, financial worksheet and word processing, as well as a wide range of vertical applications.

And you can include PRO-IV,™ the applications processor that allows you to develop applications in one-tenth the time or modify applications in one-hundredth the time it normally takes.

Boards up to complete CIES 680 systems. Our name or your name on them. That's an ongoing commitment to OEMs from CIE Systems, the company backed by the third largest trading company in the world with well over $50 billion in sales.

Just call or write CIE Systems, Inc., 2515 McCabe Way, Irvine, CA 92713-6579 (714) 660-1800. Call toll free 1-800-437-2341. In California, call 1-800-458-6279.

Electronic Distribution of Business Software

(Continued from Page 129)

could be sent quickly, error-free transmissions cannot be guaranteed.

Piracy is another serious concern of software publishers who fear losing control when others take responsibility for making copies of their products. They worry that a legitimate copy may be difficult to tell from an illegal one when factory packaging is not part of the sale.

Nevertheless, interest in the concept is building. Eric Bedell, manager of retail marketing for Lotus Development Corp., reported that the subject is "the topic of the month," judging from the number of phone calls he receives each week from market researchers studying electronic distribution. Taylor Coleman, founder of Softwareland, an Ariz.-based chain of software stores, pointed to similar growing interest.

"I think it has a place down the road, but in the short run it's not viable," Coleman said. "The trend is toward bigger and bigger programs. The successful programs are monsters. It won't work until you can speed up the transmission time dramatically."

At 1,200 bit/sec, a 192K-byte program such as the Lotus 1-2-3 would take at least 20 minutes to transmit; at 300 bit/sec, it would take more than an hour and a half. These are minimum elapsed times, however. Many experts say additional time must be allowed to account for errors in transmission.

"There is a question of integrity. Even one bit dropped means that the program won't run" and would need to be sent again, according to Enzo Torresi, co-founder of San Jose, Calif.-based Businessland.

Consequently, an additional "20% to 30% error-correcting factor" is customarily tacked on to the average downloading time, said Dave Wagman, chairman of Softsel Computer Products, a physical software distributor which plans to undertake some form of electronic distribution in the future.

Wagman said one of his major concerns is proper documentation. "To send something electronically now, the program must be very small and must require no documentation. Getting the documentation to the customer will be a problem. You could put it on-line, but then you'd have even bigger programs to transmit," he said.

The significance of personal assistance is a factor many dealers and software developers emphasize when discussing the prospects for electronically distributed software.

"It's still important, on the average, that there be a human interaction in the sale of software," Wagman said. He cautioned, though, that this might not always be the case. "If it gets to the point where people don't need point-of-sale, then electronic distribution will displace retail," he said.

Supplemental Channel

Executives at both Softyme and PC Telemart claimed that electronic distribution will function as a supplemental channel, handling perhaps 10% of the software distributed.

Most retailers appear unconcerned that downloading services direct to users will take away their businesses. "A significant part of the cost of software is in the form of added value," said Rick Inatome, president of Inacomp Computer Centers, headquartered in Troy, Mich. "And I can speculate from the current state of software that the existing distribution channels will be necessary for a while. I'm very confident that I can continue to add value."

Packaging, too, is an area where electronic distribution is expected to run into some snags. The consumer-oriented marketing lessons they have learned over the last couple of years might not be applicable.

"The big issue is that it's a move toward products becoming intangible," Bedell said. "Packaging and merchandising have become very important as ways for software companies to distinguish themselves."

Beyond marketing considerations, the prospect of unpackaged products also raises many questions about security. An authorized program diskette can look exactly like one that has been illegally copied. "With electronic distribution, the software vendors will lose one important thing that they have today — the fact that every copy looks like it came from the manufacturer," Wagman noted.

Not surprisingly, no major software publishers have yet made a commitment to any type of electronic distribution scheme. Many of them cite the potential for piracy as their chief worry. Others, like Dennis Carelli, director of sales for Software Publishing, voiced concern about maintaining their existing channels. "It will be part of our distribution, but I can't say when," Carelli said. "The lifeblood of our firm is the retail dealer, so we're not going to do anything that takes away from the retailer."

Publishers may be slow to sign up, added Ester Dyson, president of Rosen Research, "because a lot of things have to be worked out. There's no rush, so they're waiting for the other guy to do it first. The idea will catch on, but it will take some time."

Raleigh is an associate editor at Micro Market World, *a sister publication of* Computerworld.

Words Alone Don't Describe The Lasergrafix™ 1200 Printer.

The QMS Lasergrafix 1200 is a breakthrough in electronic page printing. But words alone just don't describe it. Because QMS designed the Lasergrafix 1200 to do so much more than words. With a built in intelligent controller that takes simple print commands through your normal data stream. Built-in applications firmware eliminates the need for additional software—and frees your computer's resources for other work.

The difference is graphic—for all your business, scientific and individual printing needs. Create forms that have multiple typefaces and letters up to ten inches high—all on the same line. CAD/CAM. Bit mapped and vector graphics. Pie charts. Bar charts. Even barcodes. At a crisp resolution of 90,000 dots per square inch. With a printing speed of 12 pages per minute.

And, of course, letter quality word processing.

The Lasergrafix 1200 interfaces with just about any computer system. With versatility that lets you take business graphics to the limits of your imagination. Ask for a demonstration. You'll discover that the whisper-quiet performance of the Lasergrafix 1200 speaks softer than words.

And says a whole lot more.

Tandy Seen One Up on IBM, for Now

(Continued from Page 129)

execution speed than its IBM counterpart, the company said.

The new Tandy micro, announced only three days later, is built around an 8MHz Intel 8186 and reportedly offers twice the clock speed of the industry giant's micros. A reportedly superior microprocessor and doubled clock speed enables the Model 2000 to operate from 2.5 to four times faster than IBM's XT, according to Tandy executive vice-president Ron Stegall.

But if the Tandy machine constitutes something of a coup from a purely technological perspective, Fertig claimed that from a marketing standpoint the company's announcement may have been ill conceived.

"Tandy shot itself in the foot by introducing the 2000 at Comdex," Fertig said. "The company's sales force was caught off guard by the announcement and hadn't been trained to demonstrate or sell the product."

Fertig also faulted Tandy for neglecting to provide users of its existing systems with a clearly delineated migration path to the Model 2000. Because of its ability to run the same software as the IBM Personal Computer, the firm's latest offering lacks compatibility with its older sister systems, which support Tandy's own proprietary operating system.

The Model 2000 thus marks a sharp departure from its developer's traditional product direction and will "make the company's [existing] users wonder whether they're going to be left out in the cold," he said.

The abrupt change in product course will also create additional uncertainties among the firm's users about what systems moves their supplier is likely to make in the future, he added.

Fertig further criticized Tandy for reportedly failing to accompany its Model 2000 announcement with price cuts for the company's existing systems, thus creating a "lopsided" pricing structure that works to the old products' disadvantage. "Why would anyone want to buy one of Tandy's existing [personal computers] now that the 2000 has arrived on the scene?" he asked.

Taken together, Fertig concluded, the mistakes in Tandy's latest microcomputer introduction make the firm's entry into the world of IBM compatibility look "haphazard" and create the impression that the vendor acted "without considering all the possible ramifications."

Tandy's Stegall rejected Fertig's claim that Tandy failed to prepare adequately its sales force for the Model 2000's announcement. "Every one of our 6,500 sales people received four hours of training on the machine" prior to its debut, he said.

Stegall also minimized the significance of the 2000's incompatibility with its sister systems and defended his firm as having compiled an impressive track record for "sharp" retail pricing. "The lack of compatibility with our other systems isn't really all that important because the Model 2000 was never intended as a replacement for any of our existing products," he said.

In any event, Stegall added, Tandy's history of supporting its customers with distinct migration paths has been "outstanding."

In general, he characterized the company's recent Model 2000 announcement as well planned and executed.

Talking to the French computer world is now easier than you think...

... with our sister publication Le Monde Informatique.

France's rapidly growing market for computers and data processing systems is one of the largest in the world. Currently, the installed value of general purpose computer systems is more than $11.1 billion, and a tremendous continuing demand for data processing equipment will cause outside spending on computer-related equipment to increase at an annual rate of 16%, between 1981 and 1985.

When choosing new equipment and keeping up-to-date with this ever-changing industry, top systems executives will read *Le Monde Informatique*. *Le Monde Informatique* is a weekly tabloid newspaper with a uniquely targeted circulation of 22,000 copies. The circulation profile was developed by International Data Corporation, the world's leading EDP market research firm, to reach the decision-makers and buying influences at the most important DP facilities in France.

CW International Marketing Services Department can give you one-stop advertising service in countries around the world. For more information about *Le Monde Informatique* or any of our other foreign publications, just fill out the coupon below.

WE WROTE THE BOOK ON DOCUMENTATION. AND THEN WE THREW IT AWAY.

Communication Sciences Introduces Explain. *The system that puts your software documentation where you need it most—online and in your data base.*

With Explain, you can create online user help, training procedures, program documentation and more. Because Explain uses the power of your DBMS, you can maintain the documentation as easily as you do the rest of your business data.

Access to the online documentation is at the user's fingertips. With simple commands, users can retrieve the help they need—directly from any application you link to Explain.

Chosen by Comserv Corporation as the online help system for AMAPS/3000, Explain is a powerful tool for both writers and readers of software documentation. And it's available to users of HP/3000/Image and IBM series 30xx and 43xx systems.

With Explain, you can afford to throw the books away. And keep the documentation.

For more information: call us at (612) 332-7559, or write to Communication Sciences, Inc., 100 North Seventh Street, Minneapolis, MN 55403.

The American Electronics Association (AEA) has announced a 17% increase in new members in 1983. A total of 2,350 electronics and information technology companies are participating in the organization, according to the AEA year-end report. The number of AEA associates — financial, professional and business organizations that maintain close relationships on a continuing basis — increased from 397 in 1982 to 473 in 1983.

• • •

Joseph J. Kroger, president, Computer Systems operations at Sperry Corp., has announced a consolidation of the office information systems and the communications terminals operations. The combined organization will be headed by Stuart J. Miller, vice-president, office information systems.

Nickels & Dimes

Compaq Computer Corp. has begun an initial over-the-counter offering of six million shares of common stock. The offering price per share was $11.

$$$

Analog Devices, Inc. has reported a 23% increase in sales and an 87% increase in net income for the fiscal year ended Oct. 29, 1983. Sales reached $214 million, and net income was $18.4 million.

$$$

Wyle Laboratories has reported sales for the quarter ended Oct. 31 of $79.7 million, up 33% over the same period last year. Net income was $2.5 million, or 33 cents per share, compared to a net loss of $1.5 million last year.

$$$

Televideo Systems, Inc. has reported sales of $168.7 million and net income of $22.4 million for the fiscal year ended Oct. 31, increases of 71% and 76%, respectively.

$$$

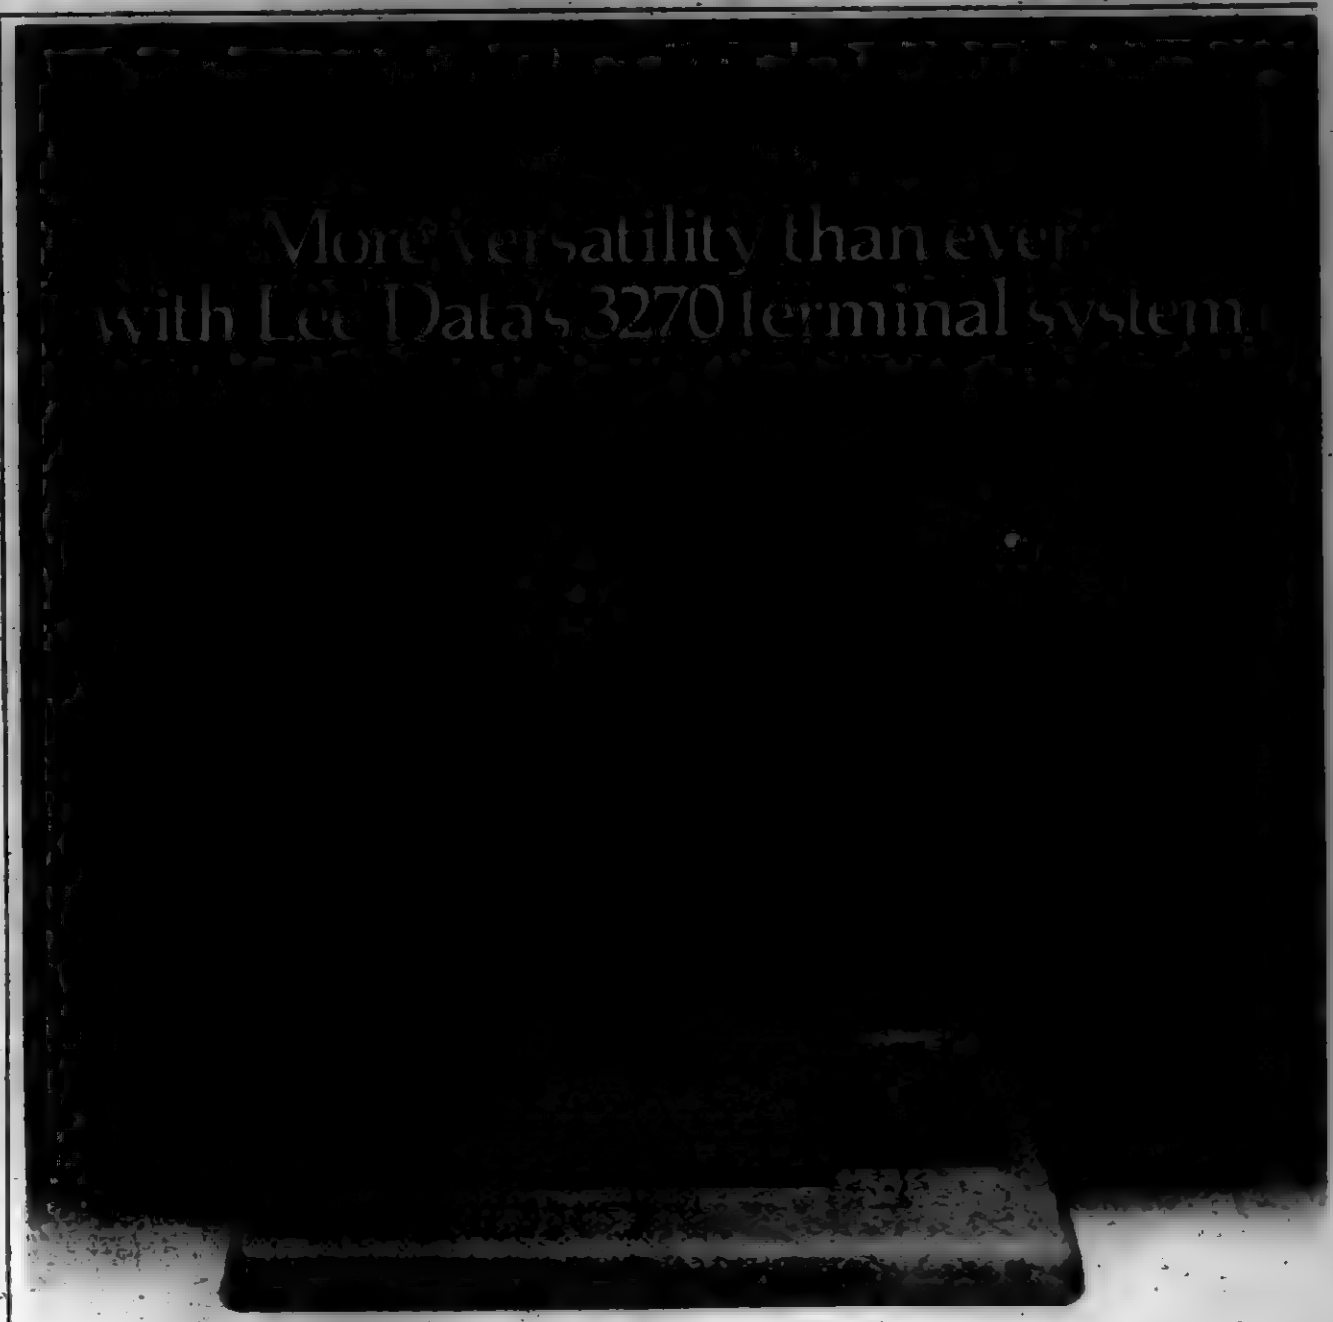
Western Digital Corp. has completed a public offering of 2.8 million common shares. Proceeds totaled $24.4 million, of which $17.5 million will be used to repurchase 2.2 million shares of the company's stock presently held by First Interstate Bank of California. Remaining proceeds will be used to reduce short-term debt.

$$$

AM International, Inc. has reported a $7.1 million increase in net income on a 4.4% increase in revenues for the first quarter of fiscal 1984, ended Oct. 29. Net income was $2.5 million, or 24 cents per share, compared with a net loss of $4.6 million, or 45 cents per share, for the first quarter of 1983.

$$$

Cambex Corp. has reported a loss of $1.9 million, or $1.09 per share, for the fiscal year ended Aug. 31, compared with income of $76,000, or 4 cents per share, for fiscal 1982.



Lee Data's new Personal Workstation now lets you enjoy all the advantages of professional business computing plus have both 3270 and asynchronous access to CPU-based applications—all from the same Lee Data workstation!

That's right! Completely-integrated, IBM-compatible personal computing —offering the latest functional capabilities and these value-added features:

Support for a wide variety of popular applications, including all compatible IBM Personal Computer software.

Personal Workstation-to-host file transfer capabilities that allow transfer of data from CPU-based files through existing system communications networks, meaning no new communications networks are ever required.

A single board design that incorporates both display station and printer support, as well as 128K of random access memory standard—with up to 256K of expanded memory on the same board. Plus a dual diskette drive feature that offers two 5¼-inch floppy diskettes, each with 320K of storage capacity!

And four standard system expansion slots for add-on requirements as your needs change.

3270 and asynchronous application access and new personal computing, too—all part of an advanced system design by Lee Data.

Let us show you how easily personal computing can become a part of your company's terminal system.

POSITION ANNOUNCEMENTS

Join a Winner

MASSCOMP offers you that rare career opportunity...the opportunity to put yourself at the center of action as we shape the computer future with our new MASSCOMP/500 Series computer and workstation:

This is the computer awarded "1982 Product of the Year" by **Electronic Products Magazine** *and winner of the "IR 100" competition for* **Industrial Research and Development** *magazine. This is the same computer that combines the performance of a large UNIX™-based 32-bit computer with the flexibility and user-ease of a mid-range minicomputer. Already it's had a significant impact on the scientific, engineering and industrial markets it was designed to serve. And it's become the standard by which all other computer systems will be judged.*

Our expansion has created key openings for the kind of professional who wants to join forces now and share in the excitement of a bold young company, fast-becoming an industry leader. As we see it, we're building much more than computers, we're building a future that will take us as far as your vision can reach. MASSCOMP offers a high-energy, rapid growth environment, where your contributions can have a major impact on a company with unlimited potential. Now is the time to start sharing in the personal and professional rewards of a key contributor's position.

For confidential consideration, direct your resume, including salary history, to:

Personnel Manager
MASSCOMP
One Technology Park
Westford, MA 01886
(617) 692-6200

An Equal Opportunity Employer

Marketing Software Systems Engineer

The individual we are seeking will provide pre-and post-sales support for third party application software vendors. Responsibilities will include: converting systems dependent code, converting, running and optimizing benchmarks, and consulting with vendor personnel on UNIX™ and MASSCOMP specific facilities. Some travel to customer sites will be required.

Qualifications for the position include: a minimum of 2 years FORTRAN programming experience, and 1 year experience as a UNIX™ user although 2 years experience as a systems programmer on any multi-user operating system may be substituted for the UNIX™ experience. Additional experience that would prove helpful would include experience in user support or as pre- or post-sales analyst for computer vendors in technical markets. Experience converting technical third-party software is also desirable.

OEM Marketing

The individual we are seeking will develop large OEM markets. Responsibilities will also include planning and executing strategies for future target OEM markets; as well as designing special promotional programs.

The qualified individual will have worked within the OEM environment for at least 4 years in a sales or marketing capacity dealing with technical applications. A BSEE or BSCS would be helpful.

MASSCOMP

MASSCOMP is the trademark of the Massachusetts Computer Corporation.

MVS SYSTEMS PROGRAMMERS

THE RECENT ACQUISITION of an MVS based IBM system has created the need for experienced IBM software specialists at Roadway's corporate headquarters in Akron, Ohio. Preferred candidates will have achieved good academic records while earning either (1) Associate's or Bachelor's Degree in Computer Science, Computer Programming, MIS or Data Processing, or (2) Bachelor's Degree, math or business-related major.

SUCCESSFUL CANDIDATES will have at least two years experience in:

- MVS System Generation and Maintenance
- JES 2
- TSO/SPF
- Performance Measurement and Tuning
- Capacity Planning
- Software Evaluation

Your experience in the above areas will allow you to participate in establishing standards and directions for future growth.

CASH COMPENSATION includes excellent starting salary and incentive pay. Fringes include stock plans, pension and insurance.

IF YOU WANT TO BE CONSIDERED for one of these positions with an established industry leader, please send your resume with college transcripts and salary requirements to the address below. Candidates whose resumes are received by January 15 will be given first consideration.

HOW TO MAKE OVER $80,000.00 A YEAR ON CICS COMMAND LEVEL PROGRAMMING

Acquire one of the most demanded & rewarding programming skills in months instead of 2 years. A complete self-study book based on CICS latest version 1.5, written in COBOL and with special emphasis on VSAM. It covers virtually every CICS technique you will ever need. Fifteen sample programs address all CICS major applications. Over 150 ready-to-use examples. Sample programs include: Menu, Add, Update, Delete, Browse, Print 24x80, Print 66x132, Print Any Size Report, Message Routing, Screen Refreshing, VSAM Alternate Index Setup and Manipulation, Constant Table Setup and Use and more.

It is hard to believe the learning can be so easy until you try it. In hours, you can start to create your own BMS maps; in days, you can start to write your own pseudo conversational CICS programs. Some CICS techniques are especially hard. When you are stuck for the technical problems, you'll be thankful you have this book.

Moonlighting on CICS projects is very rewarding. A typical 10-screen system can mean $15,000 cold cash. This book also tells you how to market your services, locate the contracts, write a proposal, make a presentation, quote the right price & draw a contract agreement without a lawyer.

But act now. Send $34.95 (plus $2.00 for shp. & hndl.) for $32. ea. for 2, $30 ea. for 3, $28. ea. for 4 and over. (shp. & hand. incl.) in Check or money order to: CCD ONLINE SYSTEMS, INC., P.O. BOX 795759, DALLAS, TX 75379. Allow 1 to 2 weeks for delivery. Full refund within 10 days if not satisfied.

What are the cold, hard facts on computer salaries?

Find out in our new, free Salary Survey.

No doubt during 1983, you knew that many organizations took a hard line on awarding liberal salary increases.

The effects of the salary freeze were felt by many computer professionals. Firms enacted across-the-board cuts, lowered compensation ranges for "new hires," restricted bonuses and benefits or set forth other policies to lower their personnel costs in countless situations.

Yet, on the other hand, did you know that salaries for *some* computer professionals *soared* right on through the uncertain business outlook?

A favorable climate for skilled professionals.

Our 1984 Computer Salary Survey and Career Planning Guide will give you new insight on trends that impact compensation, provide current salary figures and review ways the computer profession will be affected in the future. It will also explain why many computer professionals are able to advance their careers more successfully than others.

In the new Survey, you'll learn how salary differences between computer professionals are becoming more pronounced than ever:

- How some professionals—performing the same work and having a similar amount of experience—are earning significantly more than their peers.
- Why some professionals now earn as much as 25% more than they did last year.
- What emerging skills are most in demand and which positions command high salaries now and in the future.
- How size of firm and computer installation greatly affects compensation levels.

Cold, hard data with helpful tips.

The new Survey is based on contacts with more than 44,000 computer professionals and 35,000 organizations. Not only are salary averages for fifty-eight positions reviewed (including ten new ones which we never before covered), but high and low compensation ranges are also covered.

Included are positions in programming, software, systems design, data base/data communications, Edp auditing, operations, computer sales, marketing, marketing support and management. The new 32-page Survey is available without charge.

Since 1968, this annual report has helped approximately a quarter of a million computer professionals understand current trends in technology and compensation, realize how and where they fit in and what they need to do to reach their fullest potential.

Programmer/Analyst

Get Out Of The Office And Into The Mainstream.

Wilton, Connecticut
Chicago · San Francisco Bay Area · Dallas

D&B Computing Services, a leader in database management software and remote computing is seeking data processing professionals to join its national Professional Services group in the above locations.

As a Consulting Programmer Analyst, you'll accomplish more than simply cranking out code or maintaining someone else's systems. Instead, you will support and extend our marketing efforts by meeting with our Fortune 500 clients, identifying their needs, and developing and implementing a variety of interactive applications.

With the training and resources our organization can provide, you will grow professionally, learning and applying 'leading edge' technology and skills: Nomad 2 relational DBMS, sophisticated application development tools and project estimating/monitoring techniques. Concentrating on custom software development to address our clients' business needs, you will take a system from the specifications stage right through implementation and user training.

You may be an ideal candidate if you have 2-5 years of solid applications design and programming experience with one or more high level languages - preferably COBOL. DBMS experience using FOCUS, RAMIS, or NOMAD is essential. Additionally, excellent written, verbal and interpersonal and problem solving skills are necessary to perform well in this exciting, client-oriented position.

In return, we'll back you up with the business and software resources of a multi-national computer services company servicing more than 70% of the Fortune 500. In short, you'll experience a variety of challenging assignments and a high degree of visibility conducive to career growth.

Finally, you will enjoy the security and benefits of being associated with the Dun & Bradstreet family of companies, including generous medical and dental coverage, profit sharing and tuition assistance.

For immediate consideration and more information, send us a copy of your resume, in confidence, to: P. Bean, MS#11, D&B Computing Services, 187 Danbury Road, Wilton, CT 06897.

THE RIGHT DOOR?

CONSULTANT SYSTEMS, INC.

1984

For many the career path is a dark hallway with many doors. Some say ENTER, but should really say EXIT. Some say NOWHERE, though you can't see it at the time. Some say ALMOST EVERYTHING YOU EVER WANTED, but they are locked.

At CONSULTANT SYSTEMS we have an open door policy. We've taken the excellent compensation, good fringe benefits, job security, and added:

VARIETY	(in assignments, systems and applications)
ENHANCEMENT	(Building upon existing skills)
ADVANCEMENT	(Based strictly on performance)
RECOGNITION	(Visibility on projects of prime importance)
ELIMINATION	(Of corporate red tape)
ENVIRONMENT	(professionalism and personal growth)

As specialists in commercial data processing services, CONSULTANT SYSTEMS advises and assists major corporations in the areas of systems planning, technical support, customized application development, hardware/software evaluation and educational/training support.

If you're good at what you do, we'll create a place for you. Skills with CICS (Command or Macro levels) or IMS DB/DC or Honeywell DBMTP or HP IMAGE/QUERY or IDMS are a plus. Call COLLECT or drop us a line. We have a lot to talk about.

A Happy New Year is just through an open door...

Good people making technology work.

Laser Isotope Separation Program

Located 40 miles east of San Francisco in the diversified East Bay Area, the Lawrence Livermore National Laboratory is an applied science research and development facility operated by the University of California for the U.S. Department of Energy.

We currently have a position available for a Senior Group Leader in the area of Control Systems. In this position, you will report to the LIS Program Leader and be responsible for the development and implementation of a common approach in I&C hardware, software, systems protocols and man-machine interfaces for the next generation of laser and laser isotope separation separator systems located at the Laboratory and at production plant sites. Additionally, your responsibilities will include a major program activity involved in the development of process instrumentation and control subsystems.

We are seeking an individual with an MS/PhD or equivalent in Electrical Engineering or Computer Science plus demonstrated experience in planning and construction of large computer-based control and/or data acquisition systems. Proven experience in dealing with off-site organizations and demonstrated ability to work in large multi-discipline groups and communicate effectively with systems users also required.

To apply for this position, send your detailed resume with full employment history and objectives to: Art Wang, Employment Division, Lawrence Livermore National Laboratory, P.O. Box 5508, Dept. ECSI-910, Livermore, California 94550.

U.S. citizenship is required.

An Equal Opportunity Employer

You Decide.

If you want opportunity and challenge, the choice is Tandem's Software Development Team.

We pioneered the field of fault-tolerant computing. And, with our new TXP* system, we've taken on-line transaction processing further than anyone had imagined.

As career go, however, what makes Tandem different—and, we believe, better—is that we support the notion that the essence of success in our business is founded in opportunity and challenge for each of us:

Database Management

Relational Database Management

Requires 3+ years' experience in relational database management systems development to contribute to a new project, and an understanding of query processing, various data access methods, data description and data manipulation concepts. Implementation experience with architectural design and distributed DBMS.

Application Development Tools

Design/implement high-level application development tools in the areas of application specification and generation, non-procedural language design, human engineering and ergonomics.

Diagnostic Technical Leader

Design/specify the maintenance and diagnostic architecture, design methodology and diagnostic tests for support of distributed fault-tolerant systems. MSCS/MSEE and previous project management experience desirable.

Quality Assurance

Software Product Quality

Experience in the design/implementation of quality computer systems. Use your analytical and creative abilities to influence product design, implement test tools and develop regression test libraries in database management, operating systems, data communications and compilers.

QA Tech Leader

Lead a group building quality into new system software. Write test programs, design a regression test system and develop a release control library system. Sound knowledge of database management software, software reliability and operating systems.

Operating Systems

Positions involve detail design, implementation and debugging skills, substantial operating systems development experience, and excellent writing and verbal skills:

Disc Access Method and Transaction Management.

High-level design skills. Experience with file systems, access methods, device independent I/O, locking, failure recovery, transaction management.

Disc I/O Design and Implementation

Background in low-level disc I/O, disc space management, resource management, and performance optimization.

Datacommunications

Develop and enhance software from link level protocols to access methods. Projects involve ADCCP, SNA, SDLC, HDLC, X.25 and networking.

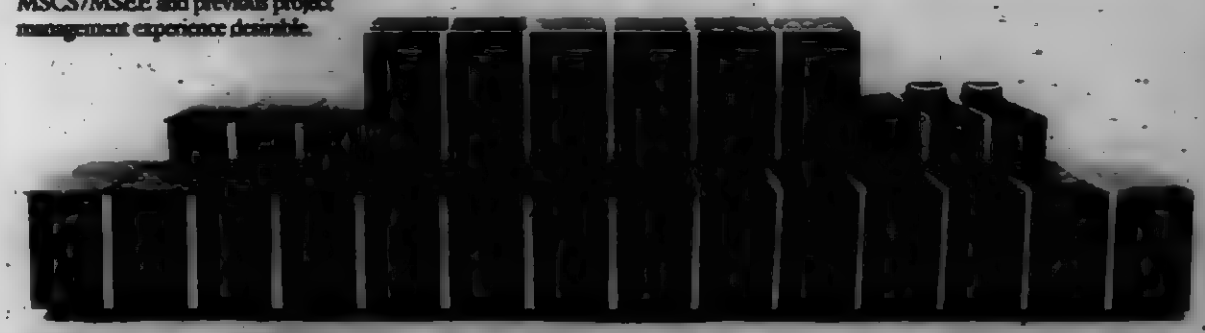
Processor Microcode

Design and develop processor instruction set and I/O channel microcode, participate in microarchitecture definition. Requires 5-7 years' experience developing instruction set firmware or related hardware design.

Call Joy Mar COLLECT at (408) 725-9097 for more details about these positions. Or send your résumé to her attention, Tandem Computers, Inc., Dept. 12/3, 19333 Vallco Parkway, Cupertino, CA 95014. We are an equal opportunity employer.

Principals only, please.

TANDEM



Makers of TXP,* the most powerful on-line computer in business today.

*TXP is a trademark of Tandem Computers, Inc.

DIRECTOR OF FINANCIAL SYSTEMS MANAGEMENT

For a Southwest based corporation. Responsibilities include documentation of current financial reporting and accounting systems, the determination of present and future management information needs, the development of alternate methods for providing the information required by management, as well as conversion and implementation. Candidates must possess an undergraduate degree in accounting, a strong background in systems design and superior analytic capabilities with effective interpersonal skills.

Software engineers. This is the place.

At Kodak, computers play a vital and ever-increasing role in every step of production. And we need skilled professionals who want to share in the challenges and rewards of technological leadership.

We're looking for talented software and computer engineers with a BS or MS and technical experience in minicomputer and microprocessor systems used in the development of software for real-time equipment control. Assignments may involve design of software systems for products or manufacturing control; programming mini- and/or microcomputers; integrating computer software and hardware into complex electromechanical systems; and quality assurance of computer programs.

Kodak also has opportunities for electrical engineers in the areas of design and development, video, test, systems and optical engineering.

We offer competitive salaries, liberal benefits, and opportunities for individual contribution and growth. Positions are available now. If you have the necessary skills and drive to meet the challenge of working for a corporation in the forefront of technology, send your resume today.

Internal Auditing Opportunity

WE'RE RELIANCE ELECTRIC — an Exxon affiliate with 24,000 employees generating an annual sales volume of $1.6 billion. Our products include a wide range of electrical/electronic/mechanical equipment and control systems and related components, with specific applications for the world's diverse industrial marketplace. Our internal auditing activities are broadening and offer the following opportunity:

SENIOR EDP AUDITOR

Your accounting and/or computer science major and minimum 5 years' career experience, with emphasis on business information systems auditing, will qualify you for consideration for the present opportunity. Your high technical skill level will be a key factor. You should be proficient in one or more programming languages (COBOL, RPG, BASIC), as well as have experience with report writer/generator software. You should also have the ability to work with various financial and manufacturing systems.

Primary responsibilities will be to: evaluate and test security and control of computer operations, programs and systems; review new systems for proper internal controls and development methodology; apply computer-assisted audit techniques using audit software; provide technical assistance and training to the general Audit Staff; and assist in the development of EDP audit plans and schedules.

This position presents a challenging opportunity with excellent internal growth potential, either within Internal Audit or in other controllership assignments. You'll also appreciate our competitive salary/benefits plan and attractive suburban location. For immediate, confidential consideration, send your resume outlining your career experience to:

Computer Application Analysts

Mobil Exploration and Producing Services, Inc., provides advanced geophysical and geological data support to Mobil Oil Corporation's exploration activities worldwide. We currently have several excellent opportunities for experienced and entry level Computer Applications Analysts. As a member of our Seismic Support Group, you will be involved in challenging assignments working with some of the most sophisticated technology available.

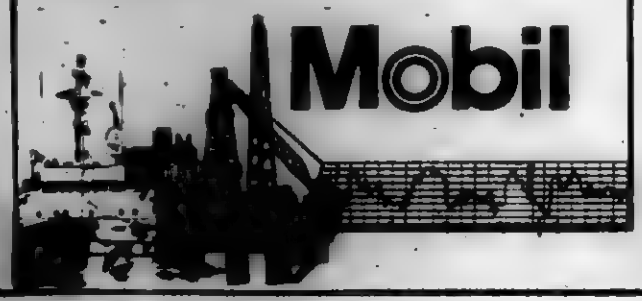
To qualify you must possess the following:

- Minimum 1-3 years technical programming experience or equivalent credentials. Experience with CDC, Cray computers or familiarity with seismic techniques/processing desired but not required.
- B.S. degree in Mathematics, Physics, or Geophysics.
- Solid knowledge of FORTRAN and good familiarity of hardware and OS software concepts.

Responsibilities include:

- Develop and implement software incorporating new seismic technology.
- Function as part of a team on a large scale software development or conversion project.
- Interact with units in MEPSI and other divisions within Mobil to provide user support/training.
- Write user/programmer support documentation for seismic software.

Mobil offers the salary and comprehensive benefits package that you expect from an industry leader. Qualified candidates should send their resume to: Glenda Lear, Employee Relations, Mobil Exploration & Producing Services, Inc., Dept. CW 12, P.O. Box 900, Dallas, Texas 75221. An equal opportunity employer, m/f.



LOOKING?

Find the job you want in Computerworld's classifieds.

No other publication carries as many ads for computer professionals as Computerworld, so no other publication can give you as wide a choice of jobs, salary and location as Computerworld.

You can even try a "Position Wanted" ad to look for exactly what you want, where you want.

Be sure you look over our recruitment ads every week, so you don't miss the opportunity that's just right for you.

MINI/MICRO PROGRAMMER ANALYST

Excellent career opportunity for motivated self-starter to design, specify, and build software systems & interfaces for IBM PC & other mini/micros as required. Heavy user/engineering interface; training & guidance to entry-level programmers in implementation phase.

The qualified candidate will have a BS in Computer Science or related discipline - graduate work an asset. 4 - 5 years broad programming & analysis experience with mini or micro systems. Experience in both high-level and Assembler languages required.

We have an excellent benefit package with 100% tuition reimbursement.

Send resume and salary requirement to Personnel Director.

Sohio

Geophysical Software Professionals

Discover Sohio in Dallas, Texas

Opportunities exist in our Geophysical Systems Development staff for individuals with experience in seismic systems development to develop state of the art seismic processing systems in a DEC VAX 11/780 - CRAY IS/X-MP environment.

The successful candidates will work within a structured analysis and design project team environment to provide seismic systems development support for the Geophysical Research and Development staff at Sohio's Geophysical Data Center in Dallas.

Geophysical Systems Analyst

Requires expertise in using structured analysis and design techniques to analyze, design, specify and test state of the art seismic systems for Sohio's aggressive exploration programs.

Minimum 3 years' experience in seismic software development including time series analysis or geophysical signal processing is required.

Individuals should have above average skills in interpersonal relations, written and oral communication. Project management skills are also desirable.

Geophysical Programmer Analyst

Seismic software experience, including development in seismic analysis and interpretation techniques (wavelet and/or velocity analysis, event tracking, filtering), signal processing and color graphics.

These positions require a BS or MS in geophysics or physics with strong skills in software development, or a BS or MS degree in computer science or math with strong skills in seismic software development.

Geophysical Data Base Analyst

Requires expertise in using structured analysis and design techniques to analyze, design, specify and test geophysical data base management systems for use with state of the art seismic interpretation systems.

BS or MS degree in computer science, math or related field is required. Minimum 3 years' training and experience in the analysis, design, specification and testing of software systems under a structured environment is required.

Individuals should have above average skills in interpersonal relations, written and oral communications. Project management skills are desirable.

All positions require familiarity with FORTRAN '77. Experience with DEC (VAX-11/750 & VAX 11/780) and CRAY IS/X-MP systems is desirable. DEC assembler, DEC systems internals, data base management systems, graphics software and hardware experience is preferred.

It's time to consider joining the Sohio adventure where the compensation package, including benefits, is outstanding. The opportunity for visability is unequaled, and to top it off, Sohio has one of the best relocation programs in the industry: To find out more, send your resume, complete with salary history, to Dan Allman, SOHIO PETROLEUM COMPANY, Dept. PROJECT ATHENA OPENINGS

The Massachusetts Institute of Technology recently launched Project Athena, a $70 million educational effort based on the integration of modern computer and communications capabilities into all phases of the educational process. Project Athena involves the use of 3,000 new DEC and IBM computers. Individuals will work closely with MIT faculty and students as well as the DEC/IBM/MIT staff members assigned to the project.

The following positions are now open and require a minimum of a Bachelor's degree or equivalent combination of education and experience.

Applications Consultant (A340)

Individual will assist in the development of education software which achieves the dual purpose of curriculum enrichment and technical coherence. Qualifications include: three to five years' in applications development with particular emphasis on graphics. Must have at least two of the following languages: C, LISP, Fortran and Pascal.

Education/Support Specialist (A338)

Individual will: 1) evaluate educational needs of user community and provide educational courses and materials to meet needs; 2) plan and supervise on-site consulting to users in terminal rooms as well as a staff "hotline" for unresolved questions; and 3) organize and publish a library of Athena-developed courseware/software. Qualifications include: excellent administrative, organizational, verbal and written communication skills. Experience in preparation of educational materials and documentation formatters (i.e., nroff, Scribe or TEX). Familiarity with design of user interfaces, software verification or graphics systems desirable.

Operations Coordinator (A339)

Individual will assist in planning and performing the administrative and technical activities involved in hardware and software installation and operation of all Project Athena computers. Develop and implement procedures and establish control. Communicate with users and interface with hardware/software vendors. Assure system and user file backup and recovery. Qualifications include: experience with UNIX operating system, supervision of computer systems operations and maintenance, and logistics/support in academic environment. Excellent interpersonal and communication skills required.

Please send 2 copies of resume, referring to appropriate job number (ex: Ms. Sally Hansen, MIT Personnel Office, W9-220, 77 Massachusetts Avenue, Cambridge, MA 02139.

MIT is an equal opportunity/affirmative action employer.

Sysorex International Inc.

DECISION SUPPORT ANALYST

Business Analysis Group

As the computer company leading in office automation, Wang today stands #264 on the Fortune 500, with continued sales revenue growth of over 30%. And that's still only just the beginning. Continued expansion has created an opportunity for a Decision Support Analyst to join our Business Analysis Group.

As a senior level individual contributor and project leader in the development and implementation of Revenue Cycle Decision Support Systems, you'll provide critical management information for key Wang decision-makers. Working with senior Business Analysis personnel and corporate management, you'll identify business issues to be addressed using Revenue Cycle DSS. Responsibilities will include developing quantitative analyses, reports and recommendations, and providing direction to others in the application of DSS tools to key business issues and problems.

The successful candidate will possess a minimum of 4-6 years related experience demonstrating a general business or business systems background, with specific experience in the use of fourth generation software tools (FOCUS, EPS, etc.) in business analysis applications. A general understanding of the principles and practices of database development and management is essential. Exposure to business analysis, automated systems development, and end-user computing desirable. MBA a plus.

Leading the way in benefits.

Wang offers one of the best benefit programs in the industry including profit sharing, stock bonus, long term stock option and stock purchase plans, company paid dental, medical and life insurance, tuition reimbursement and our employee country club.

Contact us today.

Send resume with salary history to Karen Connolly, Personnel Supervisor, Wang Laboratories, Inc., M/S 5121A, Dept. CW1/84, 12 Elizabeth Drive, Chelmsford, MA 01824.

We are an affirmative action employer.

WANG

The Office Automation Computer People

CORPORATE MIS DIRECTOR

SOFTWARE ENGINEERS

TRW's Defense Systems Group is a world leader in engineering, advanced electronics, information data systems, and software development. Our continued expansion has created career opportunities for the following Software Engineers:

PROJECT ENGINEER

To provide technical and programmatic support to a Navy customer by monitoring real-time digital data and display processing subsystem development activities performed by Navy contractors; will assess development contractor progress, initiate requirements, participate in design and test reviews, and make recommendations to the customer as a result of the reviews. A general knowledge of electronic hardware and real-time software design and application, and the ability to learn the functional capabilities and interface requirements of a number of digital computer-based electronic devices required. Degree in EE/Computer Science or equivalent with 10-12 years experience. Position is in San Diego, California.

SENIOR SOFTWARE ENGINEER

To provide software developing skills to complete development of our existing PHASE I navy project Office MIS. The selected individual will develop data base administrator support tools and procedures for the system. In addition, the person will prepare requirements for and develop system enhancements. Work will be done on a WANG VS-80 using the TOTAL data management system. Degree in Math/Computer Science/Engineering with 5-10 years experience. Position is in McLean, Virginia.

Top professionals at TRW find excellent salaries and benefits (including flexible work hours, medical/dental/vision plans, and a Christmas week shut-down.)

To explore the opportunities TRW offers, forward your resume along with your salary history and requirements in strictest confidence to:

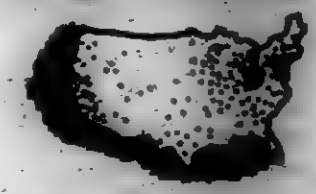
RANDOLPH'S APPROACH TO COMPUTER LEASING... AND WHY IT WORKS.

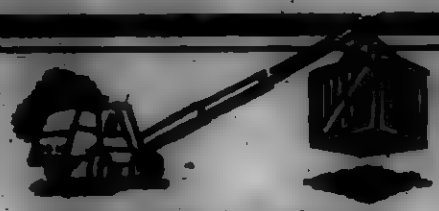
Started in 1964, Randolph has been saving its customers 30% to 70% of their DP hardware dollars . . .

And we know leasing is still the most financially attractive method of acquiring computer equipment at low cost without draining working capital.

But we learned early that the dollar-and-cents approach to computer leasing is only part of a company's concern. Equally important are: prompt installation . . . dependable servicing . . . flexible upgrade capabilities . . . and full support services. Our commitment to this approach is the key to satisfied customers . . . and our success.



RANDOLPH . . . COAST TO COAST
We presently serve customers in over 300 cities and towns from Maine to Hawaii.



EQUIPMENT ON THE MOVE
We have under management IBM computers with an original cost of over one-half billion dollars . . . and we're adding to this investment to meet the changing needs of our customers. Whether it's an IBM 3081 or 4300 system, additional tape drives, disk storage, printers or other peripherals, our equipment inventory is available to meet your company's requirements. Even hard-to-get machines are sought out and acquired for Randolph customers.

BUT . . . SERVICE MAKES THE DIFFERENCE
The real story behind Randolph's success is our approach to customer support services. To keep computer operations running smoothly and efficiently, these support services have proven to be valuable assets to our customers' D.P. operations.

Continuous IBM Maintenance Program
Manufacturer's service is available day or night, seven days a week, to insure optimal use of your system.

On-Going Technical Support
Randolph's technical staff is on call to help you reconfigure your system to meet changing data processing requirements.

Active Remarketing Division
We assure maximum return on your investment in computer equipment which you no longer use.

MEMBER OF THE FIRST NATIONAL BOSTON FAMILY
In 1972, The First National Bank of Boston purchased our S/360 leasing business, and we became a wholly-owned subsidiary.

With the Bank's financial capabilities behind us, Randolph customers benefit even more from the combined efforts of the best computer leasing and financing people in the United States.

HOW ABOUT YOU?
If your company is not presently leasing computer equipment from Randolph, you'll be interested in our new brochure outlining our special customer support services, and important facts on how we can reduce your computer costs. Call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Honeywell, IBM, NCR, Sperry Univac, Software, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 419 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Costs: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

THE
"1 - 2"
YEAR-END SOFTWARE PRODUCT SALE
FROM
HARRIS DATA SERVICE, INC.
"Our most dramatic "1-2 Punch" sale of software for the
IBM System/34, 36 and 38 computers in 1983!!

HARRIS DATA SERVICE, INC.
11439 W. Dyerbrum Avenue
Milwaukee, WI 53225
(414) 475-1783
Offices Nationally

#1 PAYROLL and FIXED ASSETS
Harris Data Service, Inc. invites you to purchase these traditional year-end emphasis software applications during our special year-end offer period.

From October 1, 1983 through January 15, 1984 purchase one or both of these internationally recognized software products for 1/3 off current selling price!

These products shall be offered with complete source and object code and user documentation as well as the Harris "Lifetime Limited Warranty" Software Product Policy . . . A promise backed by 11 years of successful history.

Now . . . for the 2nd sales punch . . .

#2 ACCOUNTS PAYABLE, GENERAL LEDGER and ACCOUNTS RECEIVABLE,
We invite you to also take advantage of our year-end sale atmosphere by purchasing A/P, G/L and A/R.

During this same year-end sales period - October 1, 1983 through January 15, 1984, Harris Data Service, Inc. will offer any two of these three internationally recognized packages at 1/2 off current selling price, each, with the purchase of one of these three packages at full price.

Buy two . . . Save 50%! Buy three . . . Save 100%!

These products shall be offered with complete source and object code and user documentation as well as the Harris "Lifetime Limited Warranty" Software Product Policy . . . A promise backed by 11 years of successful history.

Contact Harris Data Service, Inc. or an authorized Harris Product Distributor for detailed information and free "demo diskettes" for all applications.
Get your "Hands On" Harris Software Products Today!!

NEED FLEXIBLE SOFTWARE PACKAGES?

15 pointed questions to ask MSA or any software supplier

These questions will help you when you sit down with individual software companies.

They're tough questions. Relevant ones. And any supplier who is worth his salt should be able to answer them without backpedaling.

Ask MSA

We'll answer all these questions to your satisfaction—plus any others you may have.

In fact, we're probably the best equipped to answer them. Because MSA is the software company. We offer the most complete line of totally integrated systems in the software industry, including financial, human resource and manufacturing.

So you avoid the headache of trying to tie together individual systems. (And the even bigger headache of adding to them.)

With MSA's integrated systems, there's no unnecessary duplication of data or effort. Reporting is faster. All your company's information is more timely and accurate—and in the right form.

Our technical edge comes from experience

Staying ahead is easier for a company that's steeped in software technology. MSA has spent years developing, refining, testing and enhancing our systems.

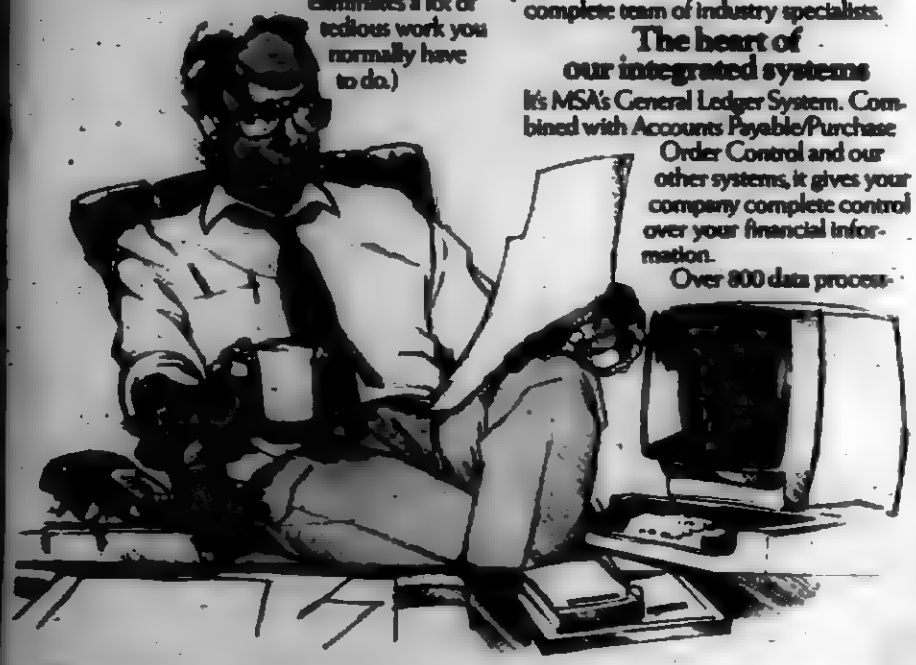
This year alone, we'll invest $25 million to make sure all our systems are technologically razor sharp. That gives us a decided advantage over flash-in-the-pan technology that may not have the bug-free logic of a more experienced system.

It also gives you a decided advantage over "custom" systems you have to update yourself.

MSA relieves you of that time-consuming burden. We update and enhance your software for a full year. Then we continue this service for a surprisingly low annual fee.

Maintenance includes keeping your system up-to-date technologically. Enhancing it with new features that make it work even harder for you.

And making sure it reflects changes in accounting procedures and government regulations, including 401(k), TEFRA, and FAS52. (That eliminates a lot of tedious work you normally have to do.)



Save this box. It can help you make an intelligent software decision.

1. Can you offer us a complete range of software systems designed to work together?
Or will we have to piece together a patchwork of systems?

2. Are your systems just record keepers, or can they really help us make decisions?
Can we pull together information from any of our integrated systems? In exactly the form we want it?

3. Can you provide business software for both mainframes and microcomputers?
Do you develop this software yourself or do you simply market it for another company?

4. Are your systems truly online so all of our information is current?
How many of your systems are online? How secure are they?

5. Will my company have to be the one that discovers the bugs in your brand new system?
Just how long have your systems actually been used, and how have they been tested?

6. Will you update your systems as technology advances and regulations change?
What are some of your most recent updates? Will you keep us current on regulatory changes?

7. Do your systems really do everything you say they will?
Or will we have to change them or add to them to get the features we want?

8. How long have you been in business?
What are your revenues? What is your growth record? Where will your company be five years from now?

9. How many systems has your company installed?
How many of these were installed in the past six months? How many of your earlier customers are still using—and liking—your systems?

10. Do your financial systems handle unlimited foreign currencies?
Do your financial systems use a common set of currency exchange rates?

11. Can you link our executives' computers directly to the mainframe—so they can get their own information?
Is that software available right now?

12. How will you make sure our own people thoroughly understand your systems?
Do you have educational centers near us, or will we have to travel all the way across the country to find one? Will you be there to help during installation and after?

13. How many of your people specialize in software for my industry?
How many accountants work for you? Human resource specialists? Manufacturing experts?

14. Do your systems have built-in features that make them easier to use?
What happens if someone needs help figuring out a feature? Do you have online documentation that's easy to understand?

15. As my business changes will your system be flexible enough to change with it?
Or will we have to pay a lot to revamp it? Or even regenerate it?

35,000 days of training

At MSA, we make sure your people have a firm grasp of our systems. Last year alone, we conducted more than 35,000 student days of customer training for over 1,800 companies. At education centers all over the world, as well as at our headquarters.

From training sessions to cassettes to complete, easy-to-understand documentation, MSA provides the most extensive Customer Education Programs in the industry.

And MSA systems are just as friendly as our people. Our online HELP feature actually guides users through our systems, and EASY-SCREEN™ lets them design their own screens without creating data processing nightmares.

If there's ever a question or problem with our systems, MSA customers are always close to service.

Our Account Managers are knowledgeable, responsive, and backed by a complete team of industry specialists.

The heart of our integrated systems

It's MSA's General Ledger System. Combined with Accounts Payable/Purchase Order Control and our other systems, it gives your company complete control over your financial information.

Over 800 data processing specialists, accountants, and financial experts work together to make MSA's financial systems the most advanced and most highly integrated in the industry.

MSA has the answers

Whatever your size—whatever your business—MSA has a total software solution.

We'll provide the highest quality integrated online software.

We'll tie your business and manufacturing software systems together, using our exclusive Extended Closed Loop™ manufacturing system.

We'll provide business software for your microcomputers, through our Peachtree Software Company.

We'll even link your microcomputers to your company's mainframe—with MSA's Executive Peachpak™ application software. A revolutionary concept that lets executives get the mainframe information they need through their personal computers.

MSA ready-to-install application software

AT&T discounts CPE for users

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — AT&T last week began selling its entire base of installed terminals to its users at discounts of 10% to 20%. Beginning March 1, a company spokesman said, the discounted prices will be reduced an additional 1% each month for a period of 15 months.

AT&T customers interested in buying terminal equipment presently on lease — known as customer premises equipment — should call their Business Service and Sales Center, the spokesman said. The center, which has the customer's equipment service record, will set a "ball-park price" immediately and call back later with a final price.

This procedure applies to systems containing 10 or fewer stations, the spokesman explained. A customer with 11 or more stations should call his marketing branch office. The telephone numbers of the Business Service and Sales Center and the marketing office are on the customer's monthly bill.

Asked for samples of the discounted prices for customer premises equipment, the AT&T spokesman said that installed two-line, four-station Comkey 416 terminals are being offered for $1,489.50, 10% less than the price of the same equipment new. Two-line, six-station Comkey 416s were reduced 10% (to $2,385 from $2,650); the six-line, 10-station Comkey 718 was reduced 15% and now costs $3,792 instead of $4,461.

The spokesman noted that these prices are approximate. He emphasized that the discounted sales price of a particular terminal will vary widely, depending on such factors as its age and complexity. A formula has been devised for relating the terminal's age to its sales price, but the spokesman declined to

See CPE page 2

FYI

Why *Computerworld* looks different this week

What's different about *Computerworld* this week?

Nothing — and everything.

Everything you've found in *Computerworld* in the past is still in the same place. The latest news is still right up front, and product news is still in the technical sections. The In Depth section remains in its convenient place, the center of *Computerworld*, and continues to provide longer, thought-provoking articles on a wide range of topics. The editorial section of *Computerworld* still follows the news section, giving our readers a forum for their insights and opinions.

But a lot is different, too. We've made the wealth of information in *Computerworld* easier to access. Because our readers' jobs require them to absorb more information than ever before, we've added indexes throughout *Computerworld* to help them find that information. We'll be using informational graphics — charts and illustrations — more than ever before to convey information quickly.

The typeface of *Computerworld* is different this week, too. It's a classic newspaper typeface, designed for readability.

And to help our readers do their jobs even better, we've expanded our technical sections with columns by experts in specific fields and by users who have implemented workable solutions to their companies' problems, as well as with columns by *Computerworld*'s own editors.

Something else is new, too — we've added a technical section on microcomputers. Centralizing the increasing amount of news on microcomputers in corporate environments that *Computerworld* has been providing for the past year, the new section will be devoted to single-user and multiuser microcomputer systems, peripherals and software.

Because of the merging of office automation into the mainstream of data processing, the news contained in the former Office Automation section has been folded into the other technical sections. If you're looking for information on electronic mail software, for example, you'll find it in the Software and Services section; local-area networks are now covered in the Communications section.

The move to a new look for *Computerworld* actually began more than a year ago, when our editors began to meet with groups of readers around the nation. After discussing the current state of the DP executive's profession and the time pressures he faces on the job every day, these readers asked us to continue giving them all the news we have been giving them, but to make it quicker and easier to get at.

Computerworld's updated look is the result of six months of work by Robert Lockwood, regarded as one of the foremost newspaper designers in the U.S. His credits include *The Christian Science Monitor*, *Chicago Sun-Times*, *Allentown Morning Call*, *Philadelphia Bulletin*, *Dallas Morning News* and *Baltimore Sun*, among others. The founder and first president of the Society of Newspaper Designers, Lockwood worked with a redesign committee made up of members of the *Computerworld* editorial and production staffs.

The updating of *Computerworld* represents our commitment to serve our readers' needs as they change. We think you'll agree.

AT&T plans high-speed data on voice lines

By Jim Duffine
CW Staff

MURRAY HILL, N.J. — Computers will be able to communicate at high speeds over the same lines used for telephone calls when AT&T's Circuit Switched Digital Capability (CSDC) is implemented in more than 12 cities by the end of this year, the company announced recently.

Calling it a "giant step" toward the totally integrated networks often referred to as integrated services digital networks (ISDN), the newly deregulated AT&T said CSDC will allow companies to send nearly all business communications over conventional phone lines. This data includes voice, graphics and data.

"We're definitely moving toward an ISDN with this," an AT&T spokeswoman said.

Developed by Bell Laboratories, CSDC will allow users to alternate between analog voice calls and digital data transmissions with the touch of a button. Speeds of 56K bit/sec will be achieved for data, AT&T claimed.

The system is now undergoing a trial at the New Jersey Bell switching center here. Initially, the capabilities of CSDC as a high-speed computer connection and as a bulk-data carrier will be tested.

Local telephone companies will install the CSDC equipment, which can be interconnected by long-distance networks of various interexchange carriers.

In addition to bulk data transfer, CSDC's 56K bit/sec digital transmission speed will also allow for teleconferencing, encrypted voice and high-speed facsimile at speeds of 4 sec/page.

CSDC consists of a software package for the Western Electric 1AESS switching system, additional hardware for the switch, modifications to the local telephone lines and some additional equipment at the customer site.

Switching from voice to data

To use the network, customers dial into the service with a five-digit code, then dial the site where the transmission is being sent. Once a call is established, the connection can be alternated between voice and data transmission, AT&T said.

When a customer sends data from a computer, hardware installed at the customer's office permits two-way digital communication over the wire pair running between the customer's site and the central telephone office.

CSDC allows simultaneous, two-way traffic by alternating the signals going in each direction and sending them at high speeds. To accomplish this, a time compression multiplexer is used to send and receive alternately bursts of data. Multiplexers are installed at both the telephone office and the customer's premises, according to AT&T.

Rather than send signals in both directions at 56K bit/sec, the multiplexers send signals at double that rate, but alternate between sending and receiving more than 700 times per second. According to AT&T, this process make it appear to the user that data is moving in both directions simultaneously.

CPE

from page 1

disclose it.

Asked whether a customer could request AT&T to visit his site and examine his customer premises equipment before pricing it, the spokesman said some site visits will "undoubtedly" be made, but the AT&T representative will decide when they are necessary.

Customers who prefer to continue leasing their present equipment can do so for the next two years at specified rates. Until next March 1, according to the spokesman, 1983 charges will continue. After that date, the monthly fee will be based on a "national lease rate," separately calculated for each product category.

The national lease rate is equal to either 70% of the highest state-tariffed charge in effect at the end of 1983 for that product line or the median of all state-tariffed rates in effect at the end of 1983 for that product line, whichever is higher. If a customer has been paying less than the national lease rate, his monthly charge after March 1 will be increased in stages over the following two years until it reaches the national level.

New rate March 1

Customers who have been paying more than the national lease rate will begin paying the new rate March 1.

The selling and leasing of AT&T's embedded terminal base is administered by AT&T Information Systems, the telephone company's deregulated subsidiary. Under the AT&T divestiture agreement, all installed, leased AT&T terminals, along with the terminal marketing and service centers, were transferred from the erstwhile Bell operating companies to the subsidiary on Jan. 1.

Prior to last week, AT&T had said it would offer only about 75% of its embedded terminal base for sale this year. Under the terms of a plan proposed to the Federal Communications Commission early last year, the company could have waited until Jan. 1, 1986 to announce prices for the remaining 25% — which included popular models of electronic private branch exchanges, key telephone, modems and data terminals.

This scheme would have been hard on users because, without knowing what it would cost to buy their installed equipment, the users could not accurately determine whether to replace or retain that equipment.

Last November, however, the FCC ruled that AT&T, after posting a sales price for a particular type of embedded terminal equipment, would have to lease it for two years at the national lease rate.

Nata raps Mountain Bell's Centrex offer

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Mountain Bell Telephone Co. was accused last week of flouting the Federal Communications Commission's Second Computer Inquiry decision.

Mountain Bell's accuser is the North American Telecommunications Association (Nata), whose members include independent manufacturers of private branch exchange equipment that competes directly with Centrex.

The dispute goes back to last March, when Nata complained that Mountain Bell, along with other Bell operating companies, had begun offering "enhanced" Centrex equipment directly despite the FCC's Computer Decision II, which says that such services, if offered by telephone operating companies, must be marketed through separate, deregulated subsidiaries.

The association has been trying to persuade the commission to issue a ruling that "Centrex service may not be expanded to provide enhanced service."

Among those involved in the controversy is the International Communications Association (ICA), a major communications users group.

The heart of Nata's petition is that Computer Decision II bars any addition to network-provided Centrex services beyond those offered in 1980, when the decision was adopted, ICA told the commission last month. "Centrex service is a significant revenue source for local telephone companies," ICA said, adding that if the Nata proposal to freeze enhancement of Centrex were granted, it "would destroy the economic and operational viability of Centrex service . . . The severe dislocation of existing Centrex customers cannot be overemphasized. . . . Moreover . . . there is simply no way companies could have effective communication systems if the relief Nata requests is granted."

The latest chapter in this controversy began last week, when Nata and other interested parties submitted "reply comments" to the FCC covering issues raised in earlier filings. According to Nata, Mountain Bell is offering "Centron 300" service on a tariffed basis in Colorado and on an untariffed basis in Utah. Nata contends that Centron is an enhanced Centrex service that includes automatic route selection, multilevel facilities restriction and automatic overflow to dial-up facilities.

The association's filing includes a Sept. 23, 1983, letter from a Mountain Bell official, Paul B. Dorius, to the Utah Public Service Commission, which said, "It is Mountain Bell's position that since Centron is directly competitive with the offerings of nonregulated terminal equipment vendors, there is no legal or public policy basis for requiring that Mountain Bell's Centron offering be tariffed."

According to Nata, this position contradicts the one Mountain Bell has taken in its comments to the FCC — that Centron is a "basic" service as that term is defined in the commission's Computer Decision II.

"At a minimum," Nata told the commission last week, "Mountain Bell's inconsistent representations . . . indicate . . . considerable uncertainty regarding . . . the parameters of the Computer [Decision] II as it pertains to Centrex." The association added that this same uncertainty underlies the enhanced Centrex offerings of other telephone companies.

Bug causes broadcast of nuke alarm

By John Gallant
CW Staff

HARRISBURG, Pa. — A mishap during the installation of a computerized emergency warning system at Pennsylvania Emergency Management Agency (Pema) headquarters here last week set off a nuclear attack warning that was broadcast to police and Civil Defense (CD) authorities in 41 of the state's 67 counties.

At 11:15 a.m on Wednesday, the following message came over teletypewriters in police radio rooms and CD headquarters: *This is an attack warning. Supplemental information will be provided when available. Take appropriate action.*

Authorities in Lehigh County moved quickly, transmitting the message of imminent attack to emergency personnel and sounding fire sirens throughout the district. But Lehigh was the only county to carry that warning all the way to the public, according to Pema Press Secretary John Comey. Within five minutes of the nuclear attack alert, officials in the other counties received notice telling them to ignore the broadcast.

The faulty warning was the result of a botched transfer between floppy disks of "canned" emergency messages during the installation of a new computerized AT&T emergency teletypewriter system, Comey said. "Somehow, the message was transmitted rather than duplicated," Comey said. "For reasons unknown as of now, the nuclear attack warning was broadcast to the counties that were already on-line with the new system."

The system, scheduled to be fully on-line at the end of last week, will be part of the nationwide Emergency Warning System. Comey said that the nuclear alert message was caught before the statewide Emergency Broadcast System could be activated.

In Allegheny County, according to Police Inspector Leonard Jackson, officials had begun to notify emergency personnel when the disregard notice came through.

Firm makes 'Ideal' choice after PL/I

1ST USER

By Paul Gillin
CW Staff

WESTWOOD, Mass. — The F. W. Faxon Co., a library serials management firm based here, prides itself on flourishing in a market that has been a graveyard for many companies. While more than 80% of its competitors have failed over the years, Faxon has achieved $200 million in annual sales, with a steady 25% growth rate.

The company attributes much of that success to keeping up with the technological Joneses. Faxon installed its first computer in 1953. Now, with most of its library services on-line, the company runs 280,000 transactions daily on its IBM 3081 Model D mainframe.

Faxon acts as an intermediary between publishers and subscribers, most of which are academic and business libraries. Some of its more than 25,000 clients subscribe to 100,000 publications. Among the services Faxon offers are subscription management, on-line serials check-in, checks on undelivered copies, union list management for libraries that share resources and a routing service.

Company expansion and the dramatic growth of the publishing industry in recent years led Faxon to seek an alternative to PL/I for its programming work. Following an evaluation that included Cullinet Software, Inc.'s IDMS data base management system (DBMS) and related application development facilities, Faxon late last year became the first user of Ideal, an integrated fourth-generation application development system from Applied Data Research, Inc. (ADR) of Princeton, N.J. Faxon also purchased ADR's Datacom/DB DBMS, Dataqeery, Datareporter and Datadictionary.

Although Ideal is oriented toward programmers, its first user at Faxon was an analyst with no programming experience. "I found that once you have detailed specs, the Ideal products lend themselves well to translation to the actual set of code," said Jeff Phillips, a section head in the technical division of Linx, Faxon's flagship serials management service.

Working with user David Brown, an electronic publishing consultant, Phillips coded the entire instruction set for a new "electronic yellow pages" service. Called Infoserv, the on-line, menu-driven service allows librarians to search for new serial sources by various keywords and topics and to request more information on subscriptions.

Infoserv "had an initial estimate of six months of programming time with two to three people," Phillips said. Using Ideal, Phillips and Brown coded the application in a little more than a month.

Screen painting and file definition were particularly simple, Phillips said. "We never had a screen written out or a format document."

CW Photo by P. Gillin

Although he had no programming experience, Jeff Phillips (right) of F. W. Faxon & Co. developed a project in a high-level language with help only from user David Brown (left). Now Faxon is using the language on a much larger programming project under the supervision of Alan Exon (center).

Ideal is now being exercised on a more intensive project. The Horizon project is a "mammoth order processing program for the Amsterdam office," according to Alan Exon, manager of advanced systems design. When completed this spring, Horizon will provide a full range of services for worldwide subscriptions that come from its Netherlands office.

Faxon is devoting nine full-time DP employees to the nine-month project. The goal is to write the program without using a single line of PL/I or assembler code. So far, Exon said, that goal is within reach.

Exon noted that Faxon will achieve major reductions in code using Ideal, Dataquery and Datareporter instead of PL/I programs. Allowing for reports that users can write themselves and programs not needed by the Amsterdam office, he estimated that 100,000 lines of Ideal code will be needed to provide roughly the same functions as two million lines of PL/I.

Because the final project will probably include 200 or more screens, Ideal's ability to prototype has been a lifesaver, Exon said. "The user doesn't have the patience to read 150 pages of specs," he said. "Ideal is wonderful for producing panels very fast. This project would be extremely difficult to create without prototyping."

Exon called Ideal's full screen editor and compilation speeds "very fast" and praised the software's ability to execute several commands on a screen simultaneously. "You can change a country code and then immediately back out to the menu and go to another panel, all in the same transaction," he said.

The product also allows Faxon to do concurrent batch processing and real-time updating of Datacom/DB indexes, he said.

However, Exon admitted that Faxon has undergone some "growing pains" as a first user. "Programming Help panels can be tedious," he commented. "String functions are inadequate, and Ideal's [procedure definition language] in some cases is verbose for the sake of clarity."

Another shortcoming of Ideal, according to Exon, is its lack of an interactive debugger. "Now you have to write your own exhibit statements, and when you debug you have to go back and recompile and relink. The perfect solution would be a language you can run in interpretive mode for interactive debugging, could edit at any point and re-execute at any point."

Fledgling info center goes up with 'Peachpak II'

1ST USER

By John Gallant
CW Staff

BATON ROUGE, La. — The first user of Management Science America, Inc.'s (MSA) Executive Peachpak II micro-to-mainframe link has successfully implemented the software as part of a fledgling information center, though end users are currently allowed to utilize only the downloading capabilities of that package.

Announced at MSA's Interact meeting in September, Peachpak II was designed to accommodate on-line data base sharing between mainframes and the IBM Personal Computer. The package was said to allow for the downloading and uploading of mainframe files in MSA applications for manipulation on any microcomputer application utilizing Software Arts, Inc.'s Data Interchange Format.

The first user, Fidelity National Bank here, has operated Peachpak II in a test environment since mid-October and in full production mode since early December. According to Glen Smarada, assistant vice-president and programming manager, Fidelity is using the package on two IBM Personal Computers in the bank's Accounting Department. The micros are linked to Fidelity's IBM 4341 Model Group 2 mainframe through a coaxial network utilizing Technical Analysis Corp.'s Irma boards.

Smarada said the decision to go with the MSA micro-mainframe link was a natural outgrowth of the DP department's goal of helping end users utilize "their own data." Early in 1983, management implemented policies on microcomputer acquisition and use and created an information center that has since attempted to standardize hardware and software selection throughout the organization. Through the information center, Fidelity purchased 25 micros, most of them IBM Personal Computers, and the first version of Executive Peachpak.

"We run several MSA applications on the mainframe, including human resources, fixed assets, accounts payable and their financial package," Smarada said. "We wanted something to interface with their financial package, and Executive Peachpak, which we installed in April 1983, was an exact match."

While the original version of the software resided only on the micro, Peachpak II required, in addition, the installation of several host programs to accommodate the data base sharing function, an undertaking that, Smarada said, was "quite simple" with MSA's assistance. More important, he said, users have had little trouble learning to use the system.

"Users used to have to take information from a variety of reports and load it into spreadsheets," Smarada said. "Now they can just download that data directly into the micro applications. That has saved these people quite a bit of time. Also, that capability has made them realize the many additional things they can do with the information available. People are producing things that were just 'blue-sky' before."

Fidelity's users are currently employing only two microcomputer applications with Peachpak II — MSA's Peachcalc spreadsheet and Lotus Development Corp.'s Lotus 1-2-3 spreadsheet package. The MSA micro-mainframe link allows data to be downloaded directly into those applications without the need for a reload at the micro level. Also, "all security is handled on the mainframe level," Smarada said. "You have to utilize the same passwords you would on a terminal. We were very concerned about security, but we're finding it to be more than adequate."

That concern for data security is one of the factors behind Fidelity's decision not to allow any uploading of data to the mainframe. "We want users to become familiar with the retrieval aspects of the system first."

Smarada said Fidelity may begin to utilize Peachpak II's uploading capabilities in the near future. The bank also plans to expand the use of micros to its 17 branches and to allow users in the Human Resources Department to take advantage of Peachpak II within the next year.

IBM picks Comshare DSS for Info Center

Seen as endorsement of 'System W'

By Paul Gillin
CW Staff

ANN ARBOR, Mich. — Comshare, Inc. last week announced a two-year "complementary marketing" agreement with IBM, whereby IBM will recommend Comshare's System W and Micro W decision support system (DSS) software for use in IBM Information Centers. It is the first time IBM has concluded such an agreement with a DSS vendor.

While both companies stopped short of calling the deal a joint marketing agreement, sources said the announcement amounts to an endorsement of System W by Big Blue.

Under the terms of the agreement, IBM and Comshare field representatives will conduct joint sales calls on customers who are interested in DSS, a Comshare spokesman said. IBM sales representatives will also refer interested prospects to Comshare for DSS applications rather than referencing three alternative vendors, as has been the company's practice in the past. However, IBM will continue to recommend alternative vendors if the customer requests that information, an IBM spokeswoman said.

The agreement also provides for IBM and Comshare to work together on future enhancements of System W to support new IBM hardware and software. Comshare will have full responsibility for providing, installing and supporting System W and will offer education and custom programming services for the software, Comshare said.

'We are their experts'

"We are their [IBM's] experts in decision support," said Richard L. Crandall, Comshare's president.

"It's the biggest thing we've ever done," he added. "The DSS market has been as confused and factionalized as the personal computer market was before IBM came in. People want leadership, and IBM is providing it."

But an IBM spokeswoman emphasized that the deal should not be construed as a joint marketing agreement or an endorsement.

"For one thing, we are not marketing System W. The reps will go together to sales prospects," she said. "We also do not endorse other vendors' software products."

Major step for Comshare

However, the deal will clearly be a major boost to Comshare, which introduced System W as packaged software just over a year ago. "It's a meteoric rise, a true success story," said Len Bergstrom, vice-president of Real Decisions Corp. in Stamford, Conn., which publishes a DSS report. "We've been watching System W for a long time. It's always been presented and packaged very well. We look at it as being very successful."

Bergstrom added that users will be the "real winners" in the wake of the agreement. "IBM's endorsing DSS will give it some momentum," he said. "We see a lot of clients wanting bundled packages. And the DSS concept is very well tied to the Information Center concept."

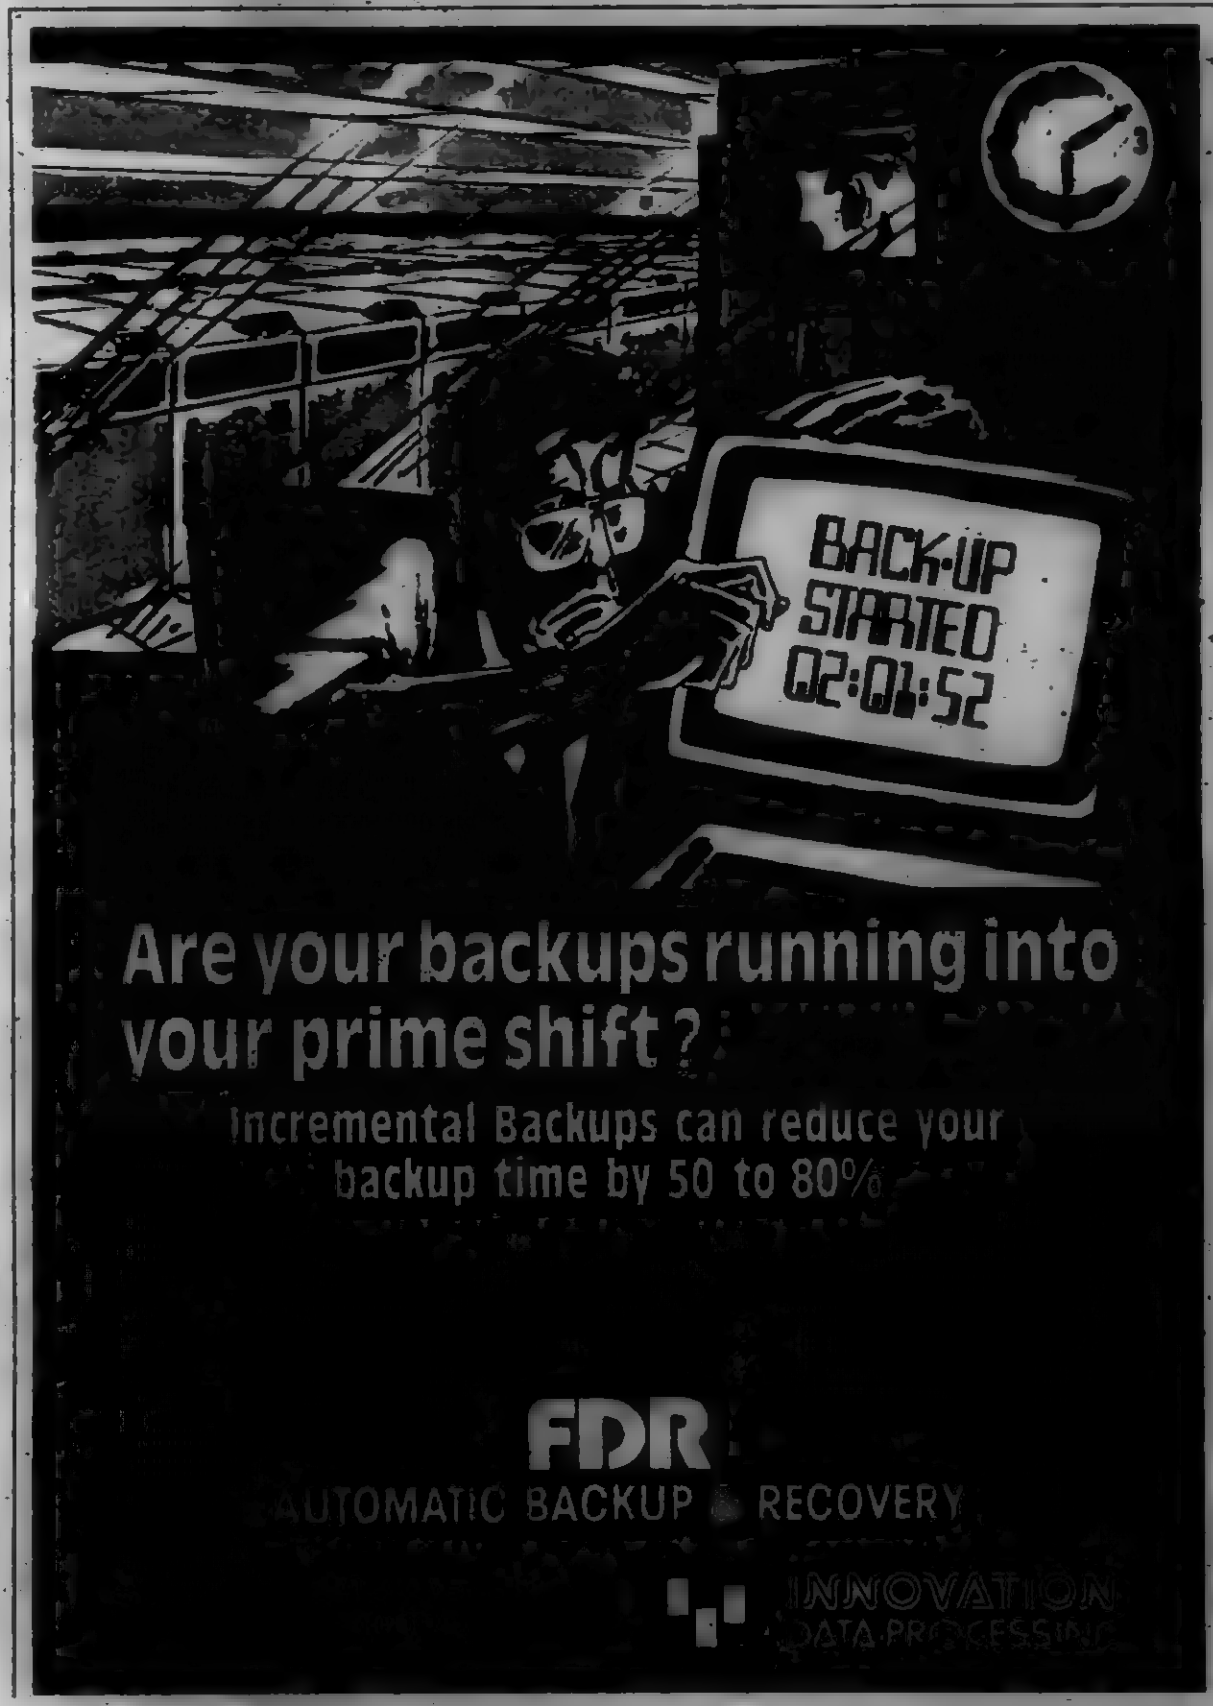
While admitting that he was "enthusiastic" of Comshare's success, a spokesman for Execucom, Inc., which markets the IFPS DSS, downplayed the significance of the deal. "I sum it up as a nonagreement," said Gary Greenfield, Execucom's vice-president of technology. "The [IBM] salesmen are not getting any commission; they're just being told to recommend [System W]. In two months it'll be as if [the deal] never existed."

Greenfield pointed to the fact that IBM will continue to offer IFPS on its Information Network remote computing service as a mitigating factor. "The System W agreement doesn't make System W a product of IBM," he said. "It also doesn't preclude IBM salesman from recommending IFPS."

Bergstrom agreed. "The question is whether IBM is going to hold together on this. I'm not sure if this is an exclusive agreement, and there may be others in the works," he said. "We've seen IBM salesmen recommend IFPS before."

The IBM spokeswoman said that the Comshare agreement was concluded with IBM's National Accounts Division (NAD), which is separate from IBM Information Services, an independent business unit that includes the Information Network. She said the NAD agreement was different from the Information Network's agreement with Execucom.

The price of System W ranges from $75,000 to $110,000. Micro W license for $1,000 for each copy, with quantity discounts available. Comshare is located at 3001 S. State St., Ann Arbor, Mich. 48104.



Franklin settles copyright dispute with Apple

Agrees to pay $2.5 million, use own operating system

By David Myers
CW New York Bureau

NEW YORK — Franklin Computer Corp. last week gave up its highly publicized legal battle with Apple Computer, Inc. over the copyrightability of operating systems and of computer programs embedded in read-only memory (ROM).

At a hastily called news conference here on Wednesday, Franklin President Avram Miller announced that his company, a maker of Apple-compatible microcomputers, had agreed to pay Apple $2.5 million to settle the dispute. In addition, Franklin agreed to accept the validity of Apple's copyright claim on its operating system software and to stop copying the Apple programs.

In accepting the settlement, Miller said Franklin was accepting "as law" the September decision of the Third Circuit Court of Appeals, which ruled that copyright protection extends to operating systems as well as to applications programs (CW, Sept. 12).

The appeals court decision had overturned an earlier lower court ruling that denied an injunction against sales of the Franklin ACE series of microcomputers.

Question remains unresolved

The settlement also means that Franklin has dropped its plans to appeal the case to the U.S. Supreme Court. As a result, the question of the copyrightability of ROM-based programs remains unresolved, according to legal experts contacted last week by *Computerworld*.

"One of the reasons we wanted to settle was that we felt we were in a lose-lose situation," Miller said. "The longer we pressed our case, the more we felt we would hurt not only ourselves, but Apple and the software industry."

In Cupertino, Calif., an Apple spokeswoman hailed the out-of-court settlement as "significant not only for us, but for other computer and software manufacturers who need [copyright] protection to design new technologies and products."

Not 'expressions of idea'

Franklin had originally argued that operating systems could not be copyrighted since they are not the "expressions of an idea" required by copyright law.

The company contended that the silicon chips holding the operating programs are useful devices rather than "expressions" and thus cannot be "understood."

As part of the settlement, Franklin has been given until April 1 to stop manufacturing computers with software copied from Apple. After then, the Cherry Hill, N.J.-based vendor can sell Apple-compatible boxes only with an operating system of its own devising.

Miller said Franklin had decided to give up its case against Apple, even though it had asked the U.S. Supreme Court to hear arguments from both sides, because the company is close to bringing its own operating system to market. "If we felt we couldn't do that, we wouldn't have settled," he said.

Miller was vague, however, when asked when the market could expect the Franklin operating system. And he would disclose neither the cost nor the time spent to develop the new operating system code.

Asked how the Apple and Franklin operating systems would differ, he replied that Franklin's operating system "implements the same functions [as Apple's] in a different code." He declined to elaborate.

In Cupertino, the Apple spokeswoman said her company had not yet studied the Franklin operating software, but noted that the out-of-court settlement provides for arbitration of future copyright disputes between the two firms.

Neither she nor Miller, however, would say anything more about the arbitration process.

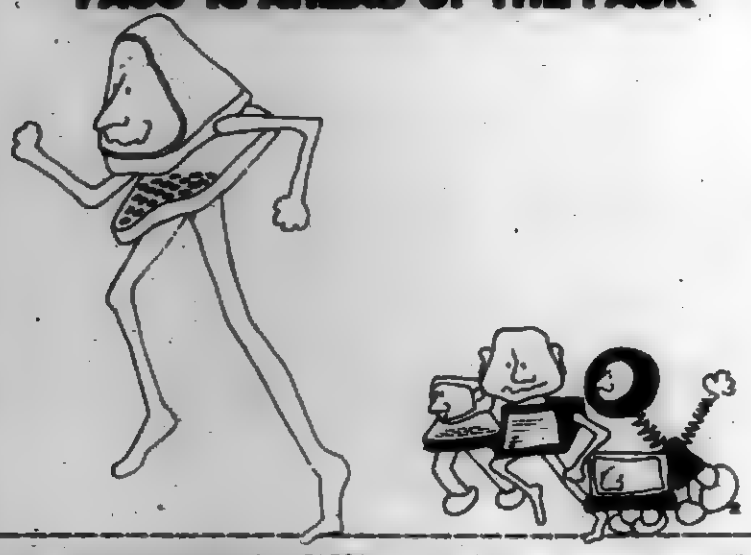
'We'll still be competing'

Asked if he considered the settlement a defeat, Miller replied, "I'll trade a legal victory for a victory in the market. We'll still be competing with Apple — just not in court."

Miller said the $2.5 million his company agreed to pay Apple is "something I'd rather not spend, but it's not a financial drain" on the firm. A source close to the micro vendor said Franklin had set aside as much as $5 million of its recent $11 million private fund-raising issue to cover the cost of any settlement with Apple.

Asked if Franklin had thus gotten off cheaply, Apple's spokeswoman declined to comment.

FOR VAX™ RESOURCE ACCOUNTING, PACS™ IS AHEAD OF THE PACK



The competition isn't even close. PACS is so good, it's the only resource accounting package in DEC's™ EAS library. Here's why:

- Flexible billing algorithms
- User budgeting and port speed accounting
- EZLOG™ for true 3-level reporting by account, project and user

Portables on planes under probe

By Lynn Haber
CW Staff

WASHINGTON, D.C. — A federal advisory committee for the airline industry has begun studying whether high-technology devices such as portable computers brought on board an airplane interfere with the aircraft's electronic equipment.

The committee on "Potential Interference to Aircraft Electronics Equipment From Devices Carried Aboard" is a result of the first meeting of the Radio Technical Commission for Aeronautics (RTCA), held this past November. RTCA, a nonprofit organization sponsored by government and industry, had been approached by Eastern Airlines to look into possible interference problems.

"In recognition of the fact that the airplanes themselves are getting more complex and heavily computerized, and these personal computers do represent a significant advance in state-of-the-art technology, we thought it was best to find out if there is a need for caution regarding their use in common operating areas on board the aircraft," explained Jim Ashlock, spokesman for Eastern Airlines. Eastern has banned the use of personal computers on board aircraft.

The RTCA plans first to look into how the passenger-operated devices affect the aircraft antennas. That testing will be undertaken by members of the airframe industry, according to Rod Jago, technical staff officer for RTCA and secretary of the special committee.

"Boeing [Co.] has volunteered, and we're asking McDonnell Douglas [Corp.] and Lockheed [Aircraft Corp.] to do some testing. We've also asked some airlines to do testing. The Federal Aviation Administration [FAA] will be asked to do some testing on their 727," Jago said.

The second phase of testing will examine what type of radio frequency spurious emissions escapes from a variety of devices. (Interference caused by escaping radio frequency energy can be seen on a home television screen in a neighborhood where someone is operating shortwave radio equipment, for example.) Some computer industry representatives who attended the RTCA meeting, including Tandy Corp., Apple Computer, Inc. and Hewlett-Packard Co., volunteered to test computer equipment, according to Jago.

"One of the things that will hopefully come out of this study is a standardized type of procedure among airlines which will help not only the people who want to use these types of devices, but also the airlines themselves," Jago said. "We'll also be able to develop some kind of listing of acceptable and not acceptable devices when used under certain situations."

The committee made no recommendation to ban the use of carry-on personal computers aboard aircraft, although an interim recommendation to ban the use of portable computers during takeoff and landing was suggested.

"The committee felt that a ban would be premature because at the present time we really don't have any documented, first-hand evidence that there is a problem," Jago said.

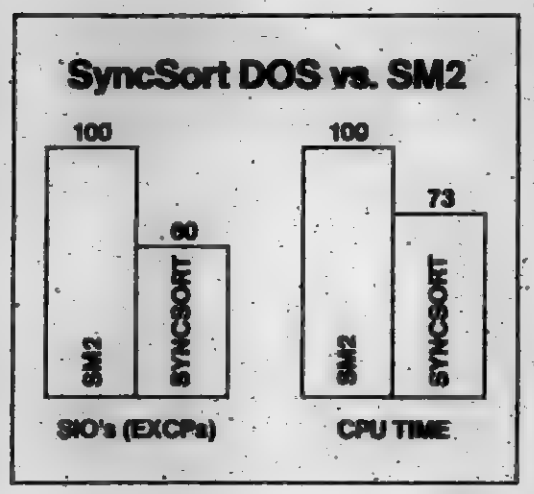
The FAA does ban the use of transistor FM radios on planes, because the band frequency on some FM devices is close to the aircraft's communications band.

IN-LAWS

Smile, IBM. New SyncSort DOS is the perfect mate for your 4300 series!

Call (201) 568-9700.

Meet our new DOS/VS(E) release.



High performance computer without high performance sort program like bride without groom—expectation without fulfillment.

—Old Chinese Proverb.

* * *

You say you just got this brand-new 4300 ? It's got big blue eyes, great price-performance curves and nifty disk drives? Now you're thinking about marrying it to IBM's 5746-SM2 sort program?

Well, don't do it pardner! The groom is definitely too old for the bride. Like IBM's other DOS sorts, SM2 is a hangover from an older generation of sorting technology.

There's only one sort around that's really fit for the hand of a glamorous new 4300 computer. And that's the latest release of SyncSort DOS. It's perfect for DOS/VS(E) and its new Fixed Block Architecture and VSAM type of data. Here's what SyncSort DOS can bring to the marriage:

1. BETTER PERFORMANCE. The first release of SyncSort DOS—back in 1978—incorporated many of the breakthroughs we made in OS sorting. Since then, in numerous releases, we've steadily cut the amount of resources that go into sorting. The new release carries on that old family tradition. Compared to SM2, SyncSort uses up to 50% less CPU Time and up to 70% fewer SIOs.

2. BETTER PROGRAMMER PRODUCTIVITY. SyncSort DOS has a host of features to cut the amount of programming time that goes into applications. You can often reduce the amount of time required for simple reports from five programmer days to one programmer day simply by using these features. They can:

- select relevant records;
- perform summaries on designated numeric fields;
- reformat records on output;
- insert character strings;
- convert numeric data to printable characters (including editing);
- produce reports divided into logical pages with headings, pagination and dating—and much more.

3. BETTER CUSTOMER SERVICE. We have the smartest Tech Service people in the business and the best and fastest service. About 85% of all requests for service are resolved within 24 hours. Try us and find out for yourself.

So if you'd like to match that phenomenal new computer with the perfect mate, give us a call. We'll send over one of our matchmakers to give you a personal demonstration.

Once you've seen SyncSort DOS in action, we don't think it'll be long before you call us with a familiar request: "Play it again, VSAM!"

syncsort INC.

Plan would widen FBI electronic surveillance

By John Gerstner
CW Washington Bureau

WASHINGTON, D.C. — A proposal to expand the Federal Bureau of Investigation's electronic surveillance of noncriminals has fueled congressional efforts to develop legislation regulating the bureau's computerized criminal records system.

The proposal, now under consideration by the National Crime Information Center (NCIC) policy advisory panel, would expand the FBI-operated interstate records exchange network to include separate files on "associates" of certain types of criminals. These include drug traffickers, terrorists, foreign espionage agents and members of organized crime.

The idea came from the policy board's planning and evaluation committee at the board's meeting in Denver last October. According to Board Chairman Fred H. Wynbrandt, the four proposed new files were among several suggested by the subcommittee.

Wynbrandt said the ideas were put forward in "a brainstorming session" on ways to make the NCIC more helpful to law enforcement officers. He said another proposal, to include information on persons known to be associated with wanted persons, was "rejected out of hand" by the board as "beyond where the policy board wanted to go, way beyond."

Wynbrandt, who is assistant director of the Criminal Information and Identification Branch within the California Attorney General's Division of Law Enforcement, said the board is sensitive to fears the NCIC might become too involved in intelligence-gathering on noncriminals. "We're concerned about privacy, security and individual freedoms," he asserted.

Nevertheless, the proposal has alarmed Capitol Hill critics of NCIC operations, who last year unsuccessfully opposed an FBI decision to turn what was originally a record system into a national surveillance system. Last April the Secret Service included on the NCIC system a file to monitor the activities of some 125 persons that the service fears may threaten the president and other protected persons.

FBI authority questioned

At the time, Rep. Don Edwards (D-Calif.), chairman of the House Judiciary Subcommittee on Civil and Constitutional Rights, which has jurisdiction over the NCIC, insisted the new file was outside existing FBI statutory authority and required new legislation. The FBI disagreed and got the support of the full Judiciary Committee, which was convinced by arguments the file was necessary to protect the president.

Since then, Edwards' subcommittee and its Senate counterpart, the Judiciary Subcommittee on Patents, Copyrights and Trademarks, have been exploring the possibility of legislating guidelines for the system's record quality and for access to the system by non-criminal-justice persons.

Congress' Office of Technology Assessment reported last year that a high level of record errors reduces the effectiveness of the NCIC. Access is also a long-standing problem, because in some states anyone can obtain NCIC records, meaning sensitive and possibly inaccurate data can be disseminated beyond the control of law enforcement authorities.

The Edwards' subcommittee plans to hold hearings on the new associate's file proposal in late February or early March. According to a subcommittee staff attorney, the proposal concerns Edwards, who attended the October policy board meeting, because the NCIC is authorized to collect, maintain and exchange only criminal data "that is a matter of public record somewhere."

Investigatory and intelligence data, however, while legitimately maintained by individual law enforcement units, should not be available on a police information system, the attorney said. He explained, "It could result in a national surveillance system for exchange of information that is derogatory and that has not been tested in court and will in fact be used against a person."

Steven J. Metalitz, staff director of the Senate subcommittee, said the panel is aware of the proposal for the associate's file and will take a closer look at it if it progresses beyond the discussion phase. He said the subcommittee "would be skeptical about [the proposal] if there is a real danger of turning the system into one that is more intelligence-oriented."

Surveillance uses of the NCIC, such as those proposed in October and the existing Secret Service file, are "inconsistent with other [record exchange] uses of the NCIC," he said.

Besides congressional opposition to the proposed files, there remains considerable work that must be completed before they can be implemented. Regional groups of the policy board, which represents NCIC users, are now considering the new files. If approved on this level, the proposal must still receive final board and FBI endorsement.

NYC computerized tax program collects $40 million from evaders

NEW YORK — A computerized tax program designed to catch up with individuals and businesses which have evaded city tax payments has resulted in the collection of millions of dollars here.

Operating since July 1981, the Taxpayer Automated Compliance System (Taca), run by New York City's Tax Division, has aided in the collection of more than $40 million from over 55,000 persons and firms.

By using a system that matches various types of files, the city has been able to detect evaders of commercial rent tax, unpaid business income tax and delinquent individual taxpayers. "We take existing city or state files and match them against our tax files," explained Umberto Dindo, director of Taca.

The initial tax project, aimed at evaders of commercial rent tax, brought in approximately $20 million alone from over 100,000 businesses.

The City Tax Division employs 30 people to run the program and mails an average of half a million letters per year, according to Dindo. "The initial match — the big one where we also had to create the files, the online system and so on — was costing about 10 cents on the dollar," he said. "But in the meantime, we've run the program over and over again, and we're down to an average of four to five cents on the dollar, which includes software, computer time, postage and clerical time."

A spin-off of Taca is to detect and follow up delinquent taxpayers, including those who have never filed returns. "Everything from the initial questionnaire all the way down to the warrant is being produced by that program," Dindo said.

The Taca program and all the associated software were developed by the data processing division for the tax department. The tax department uses two IPL Systems, Inc. 4446 computers with 4M bytes of memory.

"We are constantly developing new programs for the match because we have not done every match we would like to do," Dindo said.

CORRECTIONS

"Venture Unveils Service Merging Payroll, Personnel" [CW, Dec. 12] incorrectly stated the name of one of the vendors involved in the agreement. The service is a joint venture between Chemical Bank and Information Science, Inc.

The correct price of "Computer Access Security Report" [CW, Dec. 12] is $1,495. It is available from Federal Engineering, P.O. Box 2498, Gaithersburg, Md. 20879.

"'Valu Lib' Update Released for IBM 4300s, Series/36" [CW, Dec. 19] incorrectly identified the host computers required by Valu Lib. The product runs on IBM 4300 series and 30 series mainframes under IBM's MVS and VSI operating systems.

"Maestro" is the correct spelling of the product from Softlab Systems mentioned in the letter to the editor written by Robert Gregory [CW, Dec. 26/Jan. 2].

DEC pays $3.2 million to settle GSA claims

By Bill Laberis
CW Staff

Digital Equipment Corp. last week said it has paid the U.S. government $3.2 million to settle claims lodged against it by the Government Services Administration (GSA).

The claims, in which the Justice Department alleged DEC had defrauded the government in the sale of $70 million worth of computers in the late 1970s, were settled without DEC's admitting or the government's proving any wrongdoing on the part of the Maynard, Mass., company. However, a government spokesman said the settlement does not diminish the allegations of fraud made by the Justice Department, even though the department will not pursue court action.

"It was the government's assertion that the mispricing of data, which initiated our investigation, was the result of fraud," said Robert Ashbaugh, assistant director in the commercial litigation branch of the Justice Department. "At the same time, it could very well have been simply the kind of dispute that would involve a breach of contract.

"We really gave up our right to prove or to say, with any degree of specificity, that [DEC] was guilty of fraud when we settled the case," Ashbaugh continued.

A DEC spokesman strongly denied the allegation of fraud, saying instead that DEC complied fully with its contractual obligations and requirements in its dealings with the GSA and other government agencies. "Perhaps more than anything, this matter points up the complexity and difficulty in dealing with the government," the spokesman said.

According to the Justice Department's Ashbaugh, the $70 million deal with DEC was part of a so-called multiple award contract, wherein the GSA certifies several vendors as appropriate and the various federal agencies can then choose among the certified vendors to fill equipment needs. Inherent in this procedure is the understanding that the government is entitled to most-favored customer status, guaranteeing it the best (lowest) price, Ashbaugh said. The GSA certifies that the government is getting the best price by scrutinizing purchase orders that the certified vendors have filled for other commercial customers.

It was the government's contention that DEC did not furnish GSA all the paperwork it should have and, thus, submitted a price schedule that was higher than it should have been — several million dollars higher.

The DEC spokesman said that the government was given all the documentation it had requested. But he said further that the nature of government procurement makes it virtually impossible to make the absolute best deal with government agencies.

For example, he said, the government demands that the shipping and transit insurance fees be paid for by the vendor. And government agencies can take up to six months to evaluate a machine before paying any part of the cost.

"Under those conditions, it's hard to see how the government is going to be entitled to the best discount available," the DEC spokesman said.

Both DEC and Ashbaugh called the $3.2 million settlement fair. The government would not say whether the payment included any penalty, characterizing it only as a lump sum payment.

Hitachi execs fined $10,000

SAN FRANCISCO — A federal judge here has slapped a $10,000 fine on two Japanese computer company executives who recently pleaded guilty to charges of conspiring to transport stolen IBM systems technology from the U.S. to Japan.

U.S. District Court Judge Spencer Williams fined Hitachi Ltd. executives Kisaburo Nakazawa and Takehiro Inoue for their role in a widely publicized trade-secrets theft case involving IBM and two of its Japanese competitors. The two, both 45, are employed at Hitachi's Kanagawa Works hardware development facility in Japan and hold the titles of general manager and department manager, respectively.

Nakazawa and Inoue were among nine Hitachi employees indicted during the summer of 1982 for participating in a Japanese scheme to steal numerous IBM trade secrets, including MVS/SP Version 2 source code and hardware designs for the 3081. To obtain the highly confidential IBM property — which was later recovered after the plot was exposed — Hitachi paid more than $600,000 to Federal Bureau of Investigation agents posing as electronics black marketeers.

For months after news of the arrests broke, the Hitachi defendants refused to answer summonses, but Nakazawa and Inoue recently entered their pleas in federal court.

Software aids crackdown on trade in stolen goods

LOUISVILLE, Ky. — Armed with a computer program that they developed themselves, a veteran police detective and a data processing department joined forces in a crackdown on thieves who sell and pawnshops that buy stolen goods.

The program that runs on Jefferson County Police Department's IBM Series/1 minicomputer lets Detective Bob Roby review in minutes data that once took hours, even days. The program has helped him recover $55,000 worth of stolen property, clear 71 burglaries and make 58 arrests between February and December of '83.

On the pawnshop detail for the 600-member police force that covers the area surrounding Louisville, Roby hands out 3- by 5-in. cards asking pawnbrokers, jewelers and gold dealers to record the names, addresses, thumbprints and other data about people who sell them items. But last January, with the cards building up at the rate of several hundred per week, Roby sought help from Sgt. Phil Miller, who handles data processing and telecommunications for the department.

"I figured that if I had a computer, I could serialize things and be able to go back and check out whether an individual was selling a lot of one type of item, say, shotguns. Then we could check him out. I not only needed to know who was selling them, but needed the serial numbers, too.

"A lot of people don't keep serial numbers, so I needed a way to help them identify their stolen property," Roby said.

Days to develop

Miller used a Series/1 utility known as Prompt, produced by Mid/American Control Corp. of Shelbyville, Ky., to write a program for Roby's project. "It wasn't that hard to do," Miller recalled. "It only took a couple of days to develop and a week to test it."

Now Miller and his civilian assistant, Janice Carter, transfer Roby's data from cards onto diskettes each week. The minicomputer produces a printout, now five inches thick, cross-referencing the data by item, seller's name and pawnshop.

Roby hopes to have his own terminal or IBM Personal Computer soon to input directly into and access the Series/1. "It's been more successful than we ever dreamed. We haven't even begun to scratch the surface with the computer. Other detectives are always asking for my information, and I know we'll be able to do still more once we get our own computer and get it loaded," Roby maintained.

Primary job

Meanwhile, Miller reported that the pawnshop program is only one relatively minor task for the Series/1. The computer's primary job is keeping crime, incident and activities statistics for the department and training records. A typical use is the study of selective enforcement, where the computer is used to show what impact increased police presence has in a particular neighborhood.

One program, now being tested, that Miller developed using Prompt will catalog sex crimes, sex offenders and violent criminals so detectives can identify potential suspects by inputting individual characteristics of a crime.

The police department, which utilized general county data processing services until 1981, paid about $65,000 for its computer and software. It now spends $68,000 per year for data processing, compared to $320,000 annually when it was part of the county network.

No other 3270 protocol converter can match all these features.

Since 1977, hundreds of companies all over the world including Bell Labs, Citicorp, ITT, Liston, Westinghouse—have used Local Data products to make IBM communications easy and inexpensive.

We believe the DataLynx™/3274 is the best price/performance 3270 protocol converter on the market.

So, before you buy any other protocol converter at any price, compare the DataLynx/3274 features first. Then decide.

- SNA/SDLC or BSC protocols supported. SNA is PU type 2.
- BSC for EBCDIC and ASCII.
- 16 bit, 8 MHZ Intel 8086-2 CPU.
- Auxiliary printer support allows each async port to have a separately addressable 3287 type printer. This feature enables dial users to combine CRT and print data over one dial-up line.
- 80 types of ASCII async display terminals can emulate IBM 3278 display stations, and ASCII async printers to emulate IBM 328X printers.
- Micro to main-frame support with our FileLynx™/3278 program for the IBM PC and PC compatibles supports terminal emulation and file transfer (upload/download).
- Hard copy KSR support with our "Paper/3278".
- Unique "paging" feature supports emulation of all models of the 3278 display station.
- Pseudo-transparency feature allows host application to transmit character and control codes to async terminal devices (e.g. graphics terminals, graph plotters, mini-computers, high-speed printers with down-loadable forms control units).
- "Compu" support for micro, mini and instrumentation computers as terminal devices.
- Dual host support.
- PROM cartridge for easy user upgrade of firmware.
- Powerful, friendly configurator mode, using menus to allow parameter definition for sync ports, logical units, async ports and terminal characteristics, including help utility.
- Configuration values saved in non-volatile EEPROM.
- Monitor mode displays current status of all ports and logical units.
- May be connected to a host directly (in modem eliminator mode), or via modems on a dedicated multipoint or point-to-point line (dial-up or dedicated), via RS-232C sync ports.
- Data rates to 19,200 bps (sync & async).
- Async ports may be configured for any of 15 fixed bit rates or "autobaud", with or without parity checking, and with a specified character format.
- Simple DTE/DCE change on all ports.
- Flow control on async ports may be configured for physical and/or logical signalling.
- Virtual device support enables reconnect of dial users independent of physical port.
- Security through dual level password protection.
- Emulation of standard 3278 keyboard functions is tailored for each supported terminal type.
- 25th status line emulation.
- SAS graphics support.
- Base color support.
- 3278-5 (27 x 132 character screen) support on 9 channels with memory expansion option.
- LU configurator options provide support for various screen formats and printer page widths.
- Front panel includes 33 function status indicators.
- Self-test of channels, memory and firmware integrity is performed continually in background mode assisted by a "watchdog" timer.
- UL and FCC approved.

For more information about the remarkable DataLynx/3274 protocol converter, call or write today. And ask about our 30-day free trial program.

Array processors gaining appeal

PRODUCT SPOTLIGHT

By Tom Henkel
CW Staff

Serious scientific processing was once a task reserved for big, wealthy users of very large mainframes — oil exploration firms, defense organizations and weather-tracking institutions, for example.

Led by the booming medical imaging field, however, more users of superminicomputers and low-end mainframes have turned to stand-alone array processors to help them process computer-intensive applications like simulation, signal processing and computer-aided design.

The concept of array processing is not new. Scientists have known for some time that certain computer applications, typically those involving large blocks of mathematical data, can be processed much faster than one calculation at a time can be processed. That is basically what an array processor does: breaks up a problem, or series of problems, and puts mathematical operations into groups, or arrays. With data in that format, a processor is capable of performing multiple additions, subtractions or divisions at one time.

Array processors themselves are not new either, at least not by computer industry standards. Most of the major players in the stand-alone array processor market have been around for at least five years.

Array processors are architecturally similar to supercomputers, the multimillion-dollar processors that typically handle mammoth programs like nuclear research and meteorological forecasting. The major differences between supercomputers and array processors are cost and speed. Supercomputers currently can execute upward of 100 million floating-point operations per second (Mflops). Supercomputers recently announced by the Japanese firm Nippon Electric Co. (NEC), for example, boast a throughput of 300 Mflops; Control Data Corp. claims its top-of-the-line Cyber 205 can execute some 200 Mflops.

Array processors, in contrast, are much slower. Currently, the most powerful array processors, such as the top-of-the-line models from Star Technologies, Inc. and Floating Point Systems, Inc., offer a maximum throughput of some 100 Mflops. Most other array processors operate considerably slower, about 5 to 50 Mflops, according to Jeffry Canin, a technical analyst with the San Francisco investment banking firm of Woodman, Kirkpatrick & Gilbreath.

But if array processors are considerably slower than supercomputers, they are also considerably less expensive. Supercomputers typically cost upward of $7 million. Array processors tend to cost less than $200,000, with some units costing as little as $5,000.

With the right application, array processors can improve the calculation of a general-purpose minicomputer by a ratio of 50:1 or 1,000:1, claimed Business Development Group, Inc., a market research firm in Stanford, Calif., in a recently released report on the array processor market.

But array processors are not for everyone. Like supercomputer users, the array processing community is a very sophisticated lot. Applications tend to be very specialized, and not much packaged software is available for array processors, Bob Hausman, vice-president of development at Star Technologies, point-

Array processors found prevalent in CAT scanning

STANFORD, Calif. — Who's using array processors? A market research firm here believes it has identified the most likely markets for array processor use.

Perhaps the hottest market today for array processors is in medical imaging, according to Business Development Group, Inc., a market research firm here, which recently released a report titled "Array Processor Market Report."

The report noted that the array processor market has jumped from $10 million in 1977 to about $130 million in 1982. Hospitals, research foundations and laboratories use array processors for computer-aided tomography, more familiarly known as CAT scanning. This application uses the array processor to analyze X-ray data to generate pictures of body tissue.

Graphics artists also use array processors, as do textile designers and photograph printers, who employ array processors to manipulate patterns, photos or text to create a master plate for printing.

Oil exploration and service companies use array processors for seismic exploration, well logging and electromagnetic surveys. Array processors are used to evaluate mechanical or acoustic signals sent into land masses or the sea. The application is similar to a CAT scan, but earth masses instead of tissue are being evaluated, the report noted.

Linear programming

Businessmen and production managers, specifically those involved with mining, timber harvesting and transportation, can make use of array processors for linear programming — manipulating complicated arrays of numbers to optimize yields. The array processor can evaluate variables including time, capacity and market prices, the report noted.

Array processors are used for applied research at various universities, foundations and government agencies. Since much research involves sophisticated image- or signal-processing applications, basic research is a catchall category for array processor use, the report said.

The military is also a big user of array processors for such applications as pattern recognition, cartography, robot-controlled ordnance and navigation systems. Array processors can also be used to evaluate satellite data and radar images.

Many organizations, including the government, banks, operators of private data links, point-of-sale networks and oil companies, would like to use voice processing. Array processors can help to secure data transmission and to encrypt and identify voices by manipulating signals, the report said.

In addition, array processors can be used for complex computer-aided design (CAD) applications, such as circuit design. They can also be used for process-control applications such as monitoring many remote sensors

NEWS

ARRAY from page 11

ed out. Many users prefer to develop their own software for array processors, he added.

Canin, however, said that while the amount of packaged software for array processors is miniscule when compared with, for example, packaged software for the IBM mainframe market or the microcomputer market, there are software packages available for popular array processors which offer a basic set of algorithms. Users can customize those algorithms to suit specific applications. Among these packages are Nastran, a structural analysis package, and Spice, a standard circuit design package. Both are produced by Macneal-Schwendler Corp.

Like the applications for supercomputers, most applications for array processors are developed in Fortran. Because Fortran is somewhat more difficult than the so-called "user-friendly" languages available for file-oriented processors, not everyone is capable of using an array processor.

But according to Star Technologies' Hausman, an entire corporation does not require access to an array processor. In fact, only some applications employ a sufficient level of computations to run efficiently on an array processor. Some applications can actually be executed faster on a standard commercial processor.

Array processor users typically access the unit through a front-end processor, such as a supermini or mainframe. But Hausman noted some array processors can accommodate a microcomputer at the front end.

Some array processors can be configured with their own memory, while others share memory with the front-end processor. Sharing memory with the front-end processor boosts the speed of the array processor if it must frequently access information from the front-end processor, Canin said.

Since not all applications are suited for array processing, there must be some way to determine which programs should be sent to the array processor and which should remain in a file-oriented system. For some applications, the decision is easy, especially for the sophisticated users that typically use array processors. But for those cases in which the user is unsure whether the application will efficiently support array processing, Hausman said, there are precompilers, such as the Vast produced by Pacific Sierra, Inc., which help evaluate applications before submission to an array processor.

What makes a firm decide to buy an array processor? According to Lester Gerhardt, a computer scientist at Rensselaer Polytechnic Institute in Troy, N.Y., time is often the major criterion. Some applications are so complex and so computer-intensive that they take an extremely long time to process on a conventional mainframe or superminicomputer. If a firm has enough of those applications, buying an array processor is a logical choice. An array processor is often less expensive than adding the extra file-oriented processors to speed up processing significantly.

SCANNING from page 11

and making production decisions and for nondestructive testing applications, the report noted.

What does the future hold for the array processor market? According to Business Development Group, decreasing costs for both minicomputers and array processors will make more minicomputer users willing to buy array processors.

In addition, applications such as CAD and computer simulation are becoming more popular. Since both applications require a high degree of computing power, more users of minis and low-end mainframes will find themselves forced into buying a stand-alone array processor to go along with their current systems.

The report costs $1,500 and is available from Business Development Group through P.O. Box 3044, Stanford, Calif. 94305.

It was DP business as usual after Boston hotel fire

By James Connolly
CW Staff

BOSTON — Although a smoky electrical fire injured 65 people, caused $500,000 in damages and cost millions of dollars in lost revenues, the data processing department at the Westin Hotel here barely missed a step.

The Jan. 2 fire disrupted the hotel's main and emergency power supplies and closed the building for several days at an estimated loss of $1 million a day in revenues. But less than 24 hours after the mid-day fire drove 120 guests and hundreds of employees to the street, the data crucial to operating the "fully automated" luxury hotel — safely stored on diskettes — was being processed to meet payroll and end-of-month and end-of-year accounting deadlines.

Amid adversity, it was business as usual in the computer room. "We are very fortunate," said Systems Manager Dennis Nixon. "When the power went off, everything crashed. But I turned a key in a box on the wall for the backup power supply, and we were up again in no time at all.

"We did a complete back-off, and I took all of the software out in a box and brought it home with me for safekeeping for the night."

Nixon noted that his systems assisted in evacuating the hotel; rescuers were armed with printouts, produced every four hours, indicating the names of guests and the occupancy of each of 700 rooms.

"A lot of people are intimidated by computers. I think that after this experience, they won't be anymore, at least not in this hotel," Nixon concluded.

Backup power at work

As electrical crews worked last week to restore power, front desk clerks shivered without heat in a lobby lit by emergency lights and an oil hurricane lamp, helping guests relocate and recover luggage the day after the fire. But five floors above in the administrative offices, Nixon's dedicated backup supply provided power for IBM and NCR Corp. systems and four table lamps. In addition, accounting department personnel moved in to use Nixon's power for calculators to complete their monthly and annual reports.

Nixon said he was not using several systems, partially because he was unsure how much power was available. But, he added, his main reason for idling much of the equipment was that there were no guests and few employees to service.

The basement fire was caused by a short circuit in a switching room, according to fire officials. The blaze burned cables for the regular and emergency power supplies. But the emergency supply for the computer center was independent of both central systems.

The 37-story hotel, which opened last June, uses two IBM System/36s, two IBM Series/1s and two NCR 2160 minicomputers. The systems not only handle administrative tasks such as payroll and accounting, but provide on-line service to the hotel restaurants, housekeeping department, front desk, reservations office and other departments.

There are more than 75 terminals located throughout the hotel, but only those in the computer center were operating during the power outage.

Nixon said that the return to full operations would only mean running daily audits for the various departments for the days they were closed and manually entering payroll information for maintenance workers and other employees who worked during the shutdown. "Actually, things worked out pretty well for us, because we can concentrate on the payroll and accounting without having the rest of the operations to worry about. We're very happy that we can pay the employees. That's a priority for the company," Nixon reported.

"We could have worked on the day of the fire if they had let us back in the building. I brought the diskettes with me, just in case we couldn't get back in for days. Then I could have gone to IBM to work, but that would have taken a full day just to config-

Boston's Westin Hotel

Data base built to help Salvadorans gain asylum

By Peter Bartelin
CW Staff

WASHINGTON, D.C. — Residents of war-torn El Salvador who seek political asylum in the U.S. and who need the high level of proof it requires can now turn to a computerized data base for assistance.

The data base, jointly compiled by two private, nonprofit organizations here, helps Salvadorans obtain documented evidence that their forced return to El Salvador would subject them to human rights violations and persecution there.

The data base was recently established by the Center for National Security Studies and the Political Asylum Project of the American Civil Liberties Union (ACLU) Fund of the National Capital Area.

The Documentation Center, ACLU Fund spokeswoman Maria Bosa said, has three goals: to provide data needed by attorneys representing Salvadorans who are seeking political asylum in the U.S.; to assist those engaged in the debate over legislative initiatives to provide Salvadorans with temporary legal protection against deportation; and to make documentation of human rights abuses in El Salvador publicly available.

"The level of proof demanded of asylum applicants by the Immigration and Naturalization Service, the Immigration Courts and the State Department has always been high," Bosa said. "Asylum applicants have been required to present specific evidence corroborating that they have a particularized and individualized fear of persecution if returned to their country."

During the first three months of 1983, according to Bosa, only 31 requests for asylum were granted to Salvadorans, while 1,426 requests were denied.

The ACLU Fund began its Political Asylum Project last April. Paper indexing of the materials did not work out too well, Bosa said, so in July the Project and Center for National Strategic Studies joined up to compile the data base on the center's Televideo Systems, Inc. TS800 microcomputer, using Ashton Tate's Dbase II data base management system.

Two principal files have been compiled. One contains a list of more than 18,000 Salvadorans who have either been killed or imprisoned in El Salvador.

The second file is an index of more than 1,000 documents, such as government reports and cables, reports in periodicals and reports by the ACLU Americas Watch.

The Political Asylum Project is located at 122 Maryland Ave. N.E., Washington, D.C. 20002.

Stories on networks sought

Computerworld is looking for a few good stories on data communications networks. A Feb. 27 Special Report on the subject is now in the making, and contributions are welcome until Jan. 16.

Contributed stories can take two forms: tutorials that are not product-specific and cover a trend or direction in data communications networks; or case studies of specific users who have solved specific business problems with a certain type of data communications network.

These articles should be between four and six double-spaced, typewritten pages in length. Authors are encouraged to include any camera-ready art or black-and-white photographs.

Authors should include with all submissions a very brief biography (name, title, company, city, state) and a telephone number at which they can be reached.

Articles should be sent to Jim Bartimo, Senior Editor/Communications, *Computerworld*, Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

"We're saving $50,000 a year by eliminating SYSOUT printouts and installing JCLWTR."

That's the word from one user of AID's new JCLWTR system.

Instead of printing every production SYSOUT listing, JCLWTR stores them on disk where they're instantly accessible through special SPF screens or hard copy printouts.

The savings in paper, printing, handling, and storage costs add up so quickly that even medium and small shops can recover the system's minimal cost in just months.

JCLWTR installs on medium and large IBM systems operating under MVS and supports on-line interfaces to COM.

Find out how much you can save with AID's JCLWTR system. Send in the coupon, or call Lew Kabza at 312/654-3030.

AID Applied Information Development, Inc.
823 Commerce Drive,

50% OFF ALL AZURDATA SCOREPAK™ TERMINALS.

While MSI and Telxon are discontinuing certain model terminals and offering close-out specials, the Azurdata Scorepak continues to be a top seller. The reputation of excellence and reliability established by the Scorepak makes it a consistent leader among portable data entry terminals.

In celebration of our Scorepak success, Azurdata is offering 50% off on all Scorepak terminals. If you were doing business with our competitors

and now find they will no longer support your needs—or maybe you're ready to trade-up to a winner—we want to hear about it at Azurdata! Call now, this is a limited time offer. But you can be sure it isn't "limited to stock on hand" because Azurdata recognizes a winner and the Scorepak is here to stay.

Azurdata

Azurdata, Incorporated
4102 - 148th Avenue N.E.
Redmond, WA 98052-5182

Seattle 800-426-5002 toll free
St. Louis 800-325-0121 toll free
Atlanta 404-482-0039

Azurdata is also a manufacturer of programmable terminals and a leader in application programs such as Shelf Price Audit, Direct Store Delivery, and Route Accounting.

Offer good on orders of 50 or more terminals. Orders must be received by February 28 and shipped prior to March 31. Offer does not include the Scorepak IV and is valid only in the continental United States.

FCC rules on marketing satellites, network interfaces

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — AT&T must market receive-only satellite earth stations through its deregulated, separate subsidiary, the Federal Communications Commission ruled last month. The commission also decided that the newly divested Bell operating companies must similarly market wideband channel interfaces through separate subsidiaries.

Both actions are related to an escalating battle between the carriers and their competitors, which seems likely to affect the quality and diversity of future "smart network" services. The key issue is who will control and supply the interface between a user's terminal and the growing number of high bit-rate channels being offered by the carriers.

These interfaces are usually referred to as channel service units (CSU) or network channel terminating equipment (NCTE).

The stakes in this battle are high for users as well as vendors, since the channels are the forerunners of the integrated services digital network (ISDN) which, within the next five to 10 years, is expected to carry virtually all of the digitally encoded information generated by U.S. business communications users.

Under the FCC's Second Computer Inquiry decision, AT&T is required to market terminal equipment (customer premises equipment or CPE) through a deregulated separate subsidiary.

But the company can apply for a waiver of this rule, as it did recently in the case of receive-only earth stations.

Application rejected

The FCC rejected that application because AT&T allegedly failed to show that denial of the waiver request would deprive customers of service or cause them to incur unreasonable costs. The commissioners thus reaffirmed their position that waivers will be granted only on narrow grounds.

Last summer, the FCC decided that wideband channel interfaces are CPE and must be offered by AT&T through its deregulated subsidiary, AT&T Information Services.

The commission also decided that the separate subsidiary rule applies to CPE marketed by the divested Bell operating companies, subject to certain modifications. (Notably, already installed NCTE and CSUs can be leased and maintained by the regulated side of each operating company.)

Last month, the FCC rejected several operating companies' arguments which sought to reverse these decisions.

Wide World Photos

A Canadair CL44 turbo-prop cargo plane carrying 24 tons of computer equipment made an emergency landing on New Year's Day at Boston's Logan Airport after its landing gear failed. Some of the computer equipment, en route from Puerto Rico to Worcester, Mass., included CPUs and spare parts belonging to Digital Equipment Corp. The four-man crew escaped uninjured. According to a DEC spokesman, none of the equipment appeared damaged.

Attention DEC Mini/Micro Users:

Take advantage of the MTI/Racal-Vadic/MICOM connection.

We are experts at configuring and installing data communications networks on DEC systems.

MTI is an authorized distributor for Racal-Vadic, MICOM and DEC. And we know our products inside out. We sell, rent and lease acoustic couplers, modems, line drivers, multiplexors, port selectors and all DEC terminals. We supply cables, switches, and all the rest. What about price? You'll find we're very competitive. Call us today.

Commerce rapped for licensing fugitive dealer

By Patrick Bardelli
CW Staff

WASHINGTON, D.C. — The alleged mastermind behind a foiled plot to smuggle a sophisticated U.S.-made computer system into the Soviet Union had received 14 earlier shipments of "critical technology" equipment, U.S. officials revealed during a recent press conference held jointly by Defense Secretary Caspar W. Weinberger and Treasury Secretary Donald T. Regan.

Anonymous "top Defense Department officials" quoted in *The Washington Post* late last month criticized the U.S. Commerce Department for failing to halt the 15 shipments to a West German national, Richard Mueller, who is still a fugitive from a 1979 federal indictment charging him with export violations [CW, Nov. 21, Nov. 28, 1983].

One part of the consignment containing Digital Equipment Corp.'s VAX-11/782 supermainicomputer and other materials was displayed at a press conference last month following its return from West Germany; the other part of the consignment remains in custody of the Swedish authorities who intercepted it a week after the West German seizure.

Mueller 'under investigation'

Following the Weinberger-Regan press conference, an unidentified Defense Department official reportedly said Mueller "was under investigation by one part of the Commerce Department, while the other part of the Commerce Department was issuing licenses" to allow an unidentified New York-based computer broker and export company to purchase the equipment and ship it to the South African firm controlled by Mueller.

The official was quoted by *The Washington Post*, which said the official and others made comments under protection of anonymity during a "background briefing."

Dan Landa, a spokesman for the Commerce Department, said his department had no response to the allegations. Explaining export licensing procedures, however, he noted that licensees must agree upon issuance that the destination on the license is the end-user destination. An end user desiring to "re-export" equipment — ship it on to another country — must obtain permission from the Commerce Department.

"I mention that because that's what happened in the South African case," Landa said. "They had no right to re-export that [shipment]," Landa said.

The Defense officials quoted by *The Post* also reportedly said the Defense Department will soon place before the National Security Council a plan to stop the export of sensitive goods to communist nations.

During the cabinet-level news conference, Secretary Regan said the U.S. Customs Service, with the assistance of the West German authorities and the cooperation of the Defense Department, "prevented what would have been an espionage coup by the Soviets."

'Legal or illegal means'

The Soviet Union, he charged, "will go to great lengths to obtain high-technology equipment. Whether they have to use legal or illegal means, the [Soviet Union] will do what is necessary because it does not have the wherewithal to develop comparable technology."

Secretary Weinberger said the VAX-11/782 would help the Soviets "produce vastly more accurate ... and more destructive weapons." Defense officials reportedly have said they suspected the Soviets intended to use the equipment to operate a design and manufacturing facility for production of high-speed integrated circuits.

Government officials have said the equipment can be used for a number of military applications, including simulation of missile-target encounters, logic design of military systems and "war gaming," among others.

High-tech smuggler still at large and still very much at work

On Aug. 30, [1981], the U.S. Department of Commerce banned Richard Mueller and his company, Semitronic AG SA of Zug, Switzerland, from trading with U.S. companies until May 31, 2001. Mueller, it seems, had gotten caught exporting sophisticated computerized drafting systems to the Soviet Union.

It was not the first time Mueller had been implicated in illegal high technology shipments to the Soviets. It may not be the last time either...

— Computerworld, Sept. 14, 1981

Those prophetic words by freelance investigative reporter Christopher Simpson, part of a series of reports on high-tech smuggling he wrote for *Computerworld* in 1981, came true during the last two months of 1983. With more than 17 years of his "probation" still to be served, Mueller was implicated as the mastermind behind an attempt to smuggle a top-of-the-line Digital Equipment Corp. VAX-11/782 supersminicomputer into the Soviet Union.

Mueller had previously fled the U.S. following a federal indictment handed down in 1979 that charged him with violating export regulations and exporting a complete assembly line for mass production of microcomputers to the Soviet Union. Two officials of a Sunnyvale, Calif., firm, II Industries, were convicted on charges related to the case.

Despite that indictment, *Computerworld* reported in 1981, "no sanctions were imposed against [Mueller] until the end of August [1981], and he continued to trade with U.S. companies."

Commerce criticized

Last month, it was reported in *The Washington Post* that top Defense Department officials strongly criticized the U.S. Commerce Department for allowing 15 shipments, including the VAX-11/782, to be exported to a South African firm controlled by Mueller.

The firm, according to those anonymous Defense Department officials, "was under investigation by one part of the Commerce Department, while the other part of the Commerce Department was issuing licenses." The Commerce Department declined to respond to the charges.

With the U.S. Congress still mired in controversy in attempting to renew the Export Administration Act [CW, Nov. 21, 1983], the current investigation into Mueller's dealings seems certain to play a key role in the Defense Department's attempt to gain greater discretion over the granting of export licenses. Export regulations remain in effect, despite the impasse in Congress, because of emergency powers invoked by President Reagan when the act expired late last year.

Although Mueller was well known to the Commerce Department as a result of two illegal export cases in the 1970s, the Customs Service revealed last month that he had received a total of 15 shipments of U.S.-manufactured "critical technology equipment" worth a total of $7 million including the VAX.

"None of these shipments remains in South Africa," customs officials said.

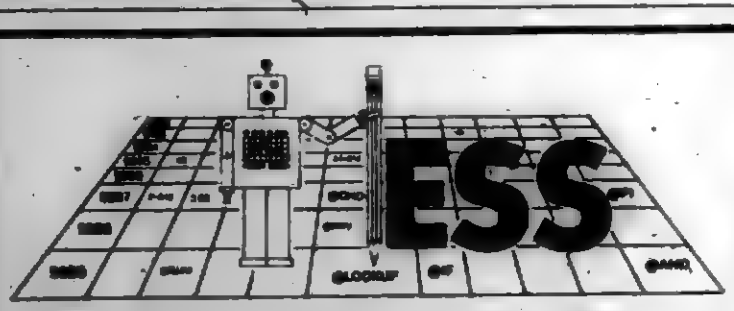
A customs investigation in South Africa revealed, according to customs officials, "that Richard Mueller, after making a sizable investment in commercial and residential real estate in South Africa, arrived there in January of 1983 and took up residence."

Established companies

Through several intermediaries, Mueller has established a number of shell companies in South Africa, beginning in 1979. These were funded through his Swiss holding companies and several Swiss bank accounts.

The customs investigation revealed that the millions of dollars worth of U.S. critical technology purchased by Mueller's firms from U.S. companies and exported to South Africa were funded through Swiss bank accounts.

One of Mueller's "front companies," Microelectronics Research Institute of Cape Town, South Africa, according to customs officials, was the importer of equipment "which was allegedly to be put into civilian electronics research by that firm," but was transferred to another "front company" that transferred it on paper to a Mueller subsidiary in Switzerland.



Electronic Spread Sheet for VM/CMS & MVS/TSO
- Not Just Another CALC -

Powerful - Spreadsheet size is limited only by available virtual storage. ESS easily handles spreadsheets with thousands of rows and/or columns.

Proven - Already in use at over 70 installations.

Compatible - ESS accepts the same commands as VisiCorp's VisiCalc® program for microcomputers. A person familiar with VisiCalc® can be using ESS productively in minutes. In addition, ESS can load and save files in VisiCalc® format.

High Performance - Assembler language code and sophisticated storage management techniques give you fast response, even with very large spreadsheets.

Easy to Install - Just load the ESS program. No additional program products or languages are required.

Cost Effective - ESS gives all your users access to personal computing capabilities for just $220 per month. Compare that to the cost of buying hundreds of microcomputers.

Questions? - For more information about ESS, or to arrange a 30-day free trial, call or write TRAX.

Quality assurance shows top growth in corporate DP

By Patricia Keefe
CW Staff

ORLANDO, Fla. — Quality assurance is the fastest growing function in corporate DP, recording growth of 55% in 1983, according to an international survey by the Quality Assurance Institute (QAI). Additional growth of 33% is projected by June 1984.

The survey indicated that almost one-third of quality assurance groups were formed at the request of senior management, which is recognizing that need is making this function the top growth area in corporate DP, QAI added.

The survey results represent the responses of 135 organizations from a spectrum of fields, approximately one-third more responses than in 1982. The responding companies were either members of QAI or attendees at the third annual DPMA Quality Assurance Symposium.

Other changes

Other changes between 1982 and 1983 noted by the survey on DP quality assurance, which the QAI defined as being responsible for establishing and measuring a process that produces quality computer systems, include:

■ A $25,000 increase in the maximum salary offered quality assurance managers in 1983 compared with the 1982 maximum of $40,000.

■ An average salary in 1983 for quality assurance managers of $42,700, representing approximately a 10% increase over a year ago.

■ An average age for the quality assurance function of two years and seven months, up from less than two years 12 months ago. However, the staffing ratio of full-time quality assurance professionals to systems analysts and programmers is less than 1:100 in 80% of the organizations that responded to the survey. "The less-than-desirable staffing ratio is attributed to the newness of the function," QAI said.

■ The survey also found the same top three responsibilities for quality assurance managers in 1983 as in 1982: certifying systems prior to production status; enforcing DP standards; and reviewing and certifying development and documentation. Increasing in importance were developing system and programming standards, developing control standards and training.

The survey found that reporting hardware/software problems and monitoring adherence to in-place security measures reduced in importance to these managers.

For 53.3% of all the respondents to

See GROWTH page 18

Quality assurance success seen linked directly to exec support

ORLANDO, Fla. — The effectiveness of the quality assurance function in an organization is directly linked to the support — or lack of support — from DP management, according to the "1983 Survey of EDP Quality Assurance" by the Quality Assurance Institute (QAI) here.

"Quality assurance managers believe that they must have strong [DP] management support to be successful," QAI said.

The strengths and problems of quality assurance vary significantly from company to company and industry to industry, but overall, have not changed significantly since 1982, according to the international survey. The greatest strengths associated with DP quality assurance include knowledgeable and motivated staff, quality and respectability of staff, improved productivity and independence.

The problems considered most serious by the organizations responding to the QAI survey include:

■ Lack of management support.
■ Lack of skilled personnel.
■ Lack of acceptance.
■ Lack of standards and procedures.
■ Time limitations.
■ Getting credibility.

About half of all quality assurance groups listed management support of recommendations as the most important practice for enforcing quality, the survey said, underlining the importance of management support. Its respondents' two most popular methods for enforcing quality are controlling the source or object code library and stopping low-quality projects from continuing until corrective steps are taken.

The survey also found that the basis for evaluating quality in 48% of the organizations polled is compliance to standards. Thirty-eight percent use professional judgment, and 12% use mathematical methods.

Also cited as important to the quality assurance function is a knowledgeable and high-quality staff. Although the survey found that most of the quality assurance personnel come from DP, QAI said the function "requires skills other than data processing."

These skills, in order of importance, include verbal communication, written communication, systems analysis, interpersonal relations, knowledge of business and interviewing, time management and business systems design.

Attention DEC Mini/Micro Users:
MTI is one of Digital's Authorized Distributors.

That's why you can always lease or buy the latest DEC terminals and micros from MTI.

MTI is a full-service distributor. Our sales engineers will help you choose the most cost-effective equipment for your needs. Our warehouse staff will check out each piece of equipment thoroughly before it is shipped. Our service department will install your equipment and give you timely maintenance and service.

As one of the few Authorized Digital Terminals Distributors, MTI can give you the best of two worlds; terminals and microcomputers, based on advanced technology from the industry leader, and the expertise and service from applications specialists.

Whether you rent, buy or lease our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. And all of this at prices that are very attractive and hard to beat. Call MTI today and save.

Akers to keynote NCC

LAS VEGAS — John F. Akers, president and director of IBM, is scheduled to be the keynote speaker for the 1984 National Computer Conference (NCC).

NCC '84 will be held here July 9-12 at the Las Vegas Convention Center; its theme is "Enhancing Creativity."

Akers, elected IBM president and a director in February 1983, joined IBM in 1960 as a sales trainee. He is a former group executive of the data processing marketing group and the information systems and communications group.

NCC is sponsored by several societies and institutions. They include the American Federation of Information Processing Societies, Inc. (Afips), the Association for Computing Machinery, the Data Processing Management Association, the Institute of Electrical and Electronics Engineers Computer Society and the Society for Computer Simulation.

Conference fees are $100 in advance or $125 on-site, according to Afips, which is located at 1899 Preston White Drive, Reston, Va. 22091.

Videotex meet set for April

CHICAGO — The Videotex '84 International Conference and Exhibition, featuring information on marketing, products and technology from the videotex industry, will be held here April 16-18 at the Hyatt Regency Hotel.

Sponsored by London On-Line, Inc., the conference theme is "Widening the Spectrum."

According to the conference organizer, it will feature three simultaneous conference sessions.

Talk shops

Among the sessions will be newly instituted "talk shops" to enable participants to follow the program elements specifically geared to their business interests.

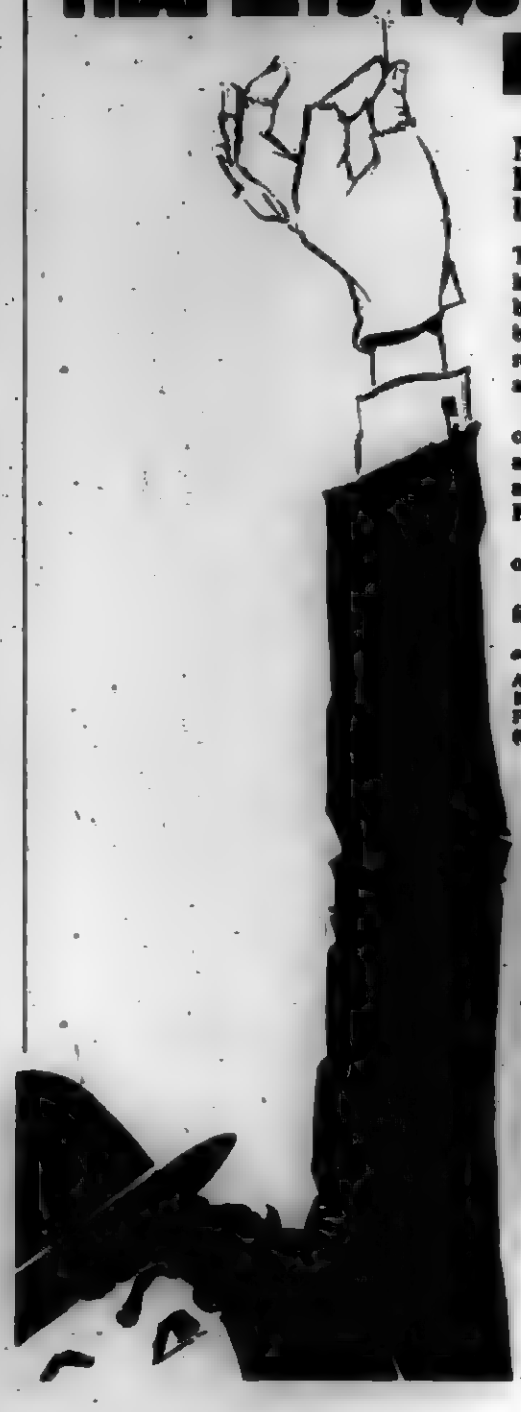
"Videotex — The Full Picture" will cover basic aspects of the videotex industry, according to the conference organizer.

"Industry Issues and Developments" will focus on major strategic and technical issues.

"Talking Shop" includes more informal sessions where delegates will be able to exchange ideas on a variety of topics.

The registration fee is $695. After Feb. 29, the fee is $795, the organizer said. London On-Line is located at Suite 1190, 2 Penn Plaza, New York, N.Y. 10121.

IBM PC/OWNERS:
HARD DISK STORAGE WITH BACKUP THAT LETS YOU FIND A NEEDLE IN A HAY STACK.



Now, in a single package, hard disk storage and file-oriented backup: Alloy's PC-STOR.™

The remarkable new PC-STOR combines the latest Winchester hard disk technology with the industry's finest file-oriented tape backup. With this system you can locate, retrieve and re-position backup data quickly, precisely and easily. The PC-STOR makes recovery from awkward floppy disk or streaming backup systems a memory of the past for users of IBM or IBM-PC compatibles.

The new Alloy Winchester hard disk comes with 35 megabytes of formatted storage, is 4 times faster than the IBM-XT system, and is especially designed for ease of use. It can be purchased as the PC-DISC™, a hard disk system without backup, or as a PC-STOR, a hard disk with file-oriented tape backup.

If you already have a hard disk system, you should add file-oriented tape backup: Alloy's PC-BACKUP™.

For the ultimate in hard disk and hard disk backup systems, find out more about Alloy's advanced product line, today.

GROWTH

from page 17

the survey, the average number of reviews per system development projects was one to three; when that question was asked only of the DP organizations that responded, the percentage rose to 75% for one to three reviews. This review process typically accounted for 2% to 5% of the project cost among the combined organizations (44.1%) and by 50% of responding DP organizations.

After the review, reports are issued by only 69% of the overall respondents (60.7% of the responding DP organizations).

Not cost-justified

In addition, 84% of the survey respondents do not cost-justify their function to management. Of the respondents who represented DP organizations, 67.9% do not cost-justify their function to management.

The majority of the quality assurance groups report to either the senior DP manager or the manager of DP support/planning. Less than 20% report to the manager of systems and programming and those that do "appeared to be the least effective in promoting quality data processing," the survey report said.

Quality assurance was found to flourish in organizations using formal design and maintenance methods. Approximately three-fourths of the organizations having quality assurance groups use formal system development life cycle methods, although close to half of the system development life cycle methods used were developed in-house.

Moreover, about half the quality assurance groups use a formal review process, such as review checklists, to ensure that quality is built in during the developmental process. Most often, survey respondents (52.8%), combined a review team with a quality assurance staff member to conduct these reviews.

During the review, over three-fourths of the quality assurance analysts responding use probing, the survey found.

Approximately one-half use questionnaires, 20% use checklists and 12% reported performing part of their analysis using software.

Copies of the survey are available for $25 if payment is included with the order ($35 invoiced). Copies are distributed to QAI members at no cost from Quality Assurance Institute, which is located at 9222 Bay Point Drive, Orlando, Fla. 32819.

INTERNATIONAL REPORT

CW INTERNATIONAL NEWS NETWORK

AUSTRALIA

NORTH SYDNEY — Austnet Electronic Funds Transfer (EFT) Services Pty. Ltd. has established an on-line link with the U.S.' Visa automated cash disbursement system. According to Austnet EFT's technical director, Chris Reilly, the company is the first EFT service outside the U.S. to link into the Visa system, enabling Visa card holders from anywhere in the world to withdraw cash instantly from Visa automated teller machines.

PERTH — A records management system that reportedly allows organizations to catalog and file all of their incoming and outgoing documents has been jointly developed here by Computer Power and the Systems Research Institute of Australia. The software was created for the Western Australian Government and will run on several different manufacturers' computers. It is presently up and running in the War Department of the Premier, and in the Department of Agriculture. It will next be implemented at the Metropolitan Water Authority and the Education Department.

BRAZIL

RIO DE JANEIRO — The Brazilian computer firm Cobra is reportedly facing a major crisis with the resignation of its president, Antonio Carlos De Loyola Reys. Without directly criticizing company shareholders, Loyola Reys attributed his resignation to the fact that resources were never allocated where most needed and that the role of the company, in terms of technological development, has never been clearly defined. According to Loyola Reys, the shareholders should allocate funds to relieve the company of debt and also rearrange the composition of shareholders to give the government absolute majority. It is not yet known who will replace Loyola Reys.

CHINA

BEIJING — China's largest domestically produced mainframe was unveiled here recently by the Research Institute of Computing Technology. The 64-bit Galaxy System 757 is capable of operating at speeds up to 10 million instructions per second, ten times faster than China's former top-of-the-line DJS 260 system. The System 757 has a main memory of 520K bytes and is intended for parallel processing in large-scale scientific and engineering applications.

FRANCE

PARIS — Carte Bleue, the credit card system developed by Intelmatique here with 3.3 million customers, has adopted "smart card" technology. Intelmatique will begin issuing the new cards, with memory, intelligence and security implanted in a microprocessor on the card in February.

JAPAN

TOKYO — Digital Research Japan has announced a Kanji version of its CP/M microcomputer operating system. Kanji CP/M has the ability to convert Kana and Roman letters into a Kanji phrase or sentence; the user simply inputs Kana or Roman characters and presses the Kanji conversion key. According to Digital Research Japan, Mitsubishi Electric Corp., Sanyo Electric Co. Ltd. and Sord Computer Corp. are among nine vendors that plan to adopt the Kanji CP/M operating system as a standard for their machines.

TOKYO — Toshiba Corp. has combined lens technology and convergent circuit technology to create a display of 10,000 characters on a 100-in.-high screen. The display system is said to have six different types of signal processing circuits that handle video and computer signals for large screen displays needed in video con-

HARD FACTS

ABOUT THE REAL LEADER IN COMPLETE SOFTWARE FOR BUSINESS: RAMIS II FROM MPG

FACT: RAMIS II Is The One System For All Your Users

To meet the full spectrum of application development and Information Center needs, RAMIS II starts with the most advanced decision support capabilities: a powerful report writer, a complete relational language, full-color business graphics, and much more.

Then we add a data base manager robust enough for high-performance on-line applications, a multitasked TP monitor that minimizes overhead and state-of-the-art screen formatting.

The result is the only integrated data base/data communications system designed for both highly structured transaction processing applications and unstructured decision support systems. And, the only product designed to fully unlock the power of your IBM mainframe, whether it's a 4321 running SSX, or a 3081 running MVS/XA.

RAMIS II Unlocks Your Existing Data

RAMIS II maximizes the return on your investment in data through ready access to ADABAS, IMS, TOTAL, DL/I, and IDMS data bases, as well as VSAM, ISAM and sequential files.

With the most powerful report writer available, plus graphics, RELATE and even English comprehension, RAMIS II unlocks external data easily and efficiently.

The Full Commitment And Support Of Martin Marietta

Leadership takes vision, plus the commitment and resources to turn that vision into bold new products.

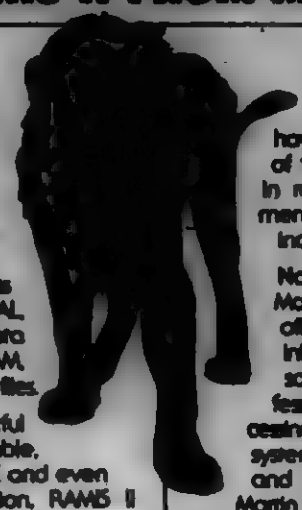
FACT: More copies of RAMIS II have been sold than all other 4 GL's combined.

FACT: RAMIS II English comprehension responds to everyday English commands.

FACT: MPG developed the first practical relational language.

FACT: There's no more powerful system for screen-based applications than RAMIS II.

FACT: RAMIS II was the first product designed for both application building and Information Centers.



To achieve our goal of a complete software solution, we have invested an average of 16% of annual revenues in research and development—more than twice the industry average.

Now, as part of Martin Marietta Data Systems, we offer a complete range of information solutions, from software products to professional services, from processing services to integrated systems. And, the financial and technical strength of Martin Marietta, a diversified company with more than 5½ billion in revenues, is accelerating new product development.

It takes more than a roar to be the leader. When it comes to providing a complete software solution, the facts prove there's only one real leader—RAMIS II from MPG.

To get all the facts, visit one of our regional Product Demonstration Centers, or attend a free RAMIS II seminar. For more information, call your local MPG office or call toll free (800) 257-5171. (In New Jersey call (609) 799-2600, Ext. 2325.)

"Rockwell International eliminates order management paperwork and ships products faster with a ***Tandem NonStop Computer System.***"

Robert P. M[illegible]
Avionics Group

Our Tandem NonStop computer helps us dramatically streamline order tracking for our broad line of products here at the Collins avionics facilities in Cedar Rapids. This automated operation has meant we've been able to ship our products faster as well as respond to customer inquiries in a much more timely, accurate fashion.

The Tandem system consolidates all data pertaining to the orders from order entry to scheduling, inventory, to packing lists, and right on down the line to shipping. And, because the system is on-line, other departments have immediate access to this information as well. Accounting, for example, now generates invoices automatically, resulting in much improved cash flow. Manufacturing is saving $175,000 a year in internal freight charges due to the reorganization of ordering and shipping procedures, and the Group as a whole has been able to eliminate more than 300,000 reproduced documents a year.

Other system benefits contributing to our improved customer service include better control of backorders, more accurate pricing information, and the ability to make detailed forecasts of market conditions for planning purposes. The net result is an operation that is helping us achieve some very significant gains in plant productivity.

The NonStop System.

Ideally suited to on-line transaction processing where continuous availability of up-to-the-second information is critical to your business.

Tandem. Fully supported by a worldwide sales, training, service and manufacturing organization.

For information on how a Tandem NonStop system can improve your productivity or your P/L statement, call your local sales office or Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014, U.S.A. Toll Free 800-482-6336 or (408) 725-7500 in California.

NonStop Transaction Processing

Universal interconnection seen next interchange step

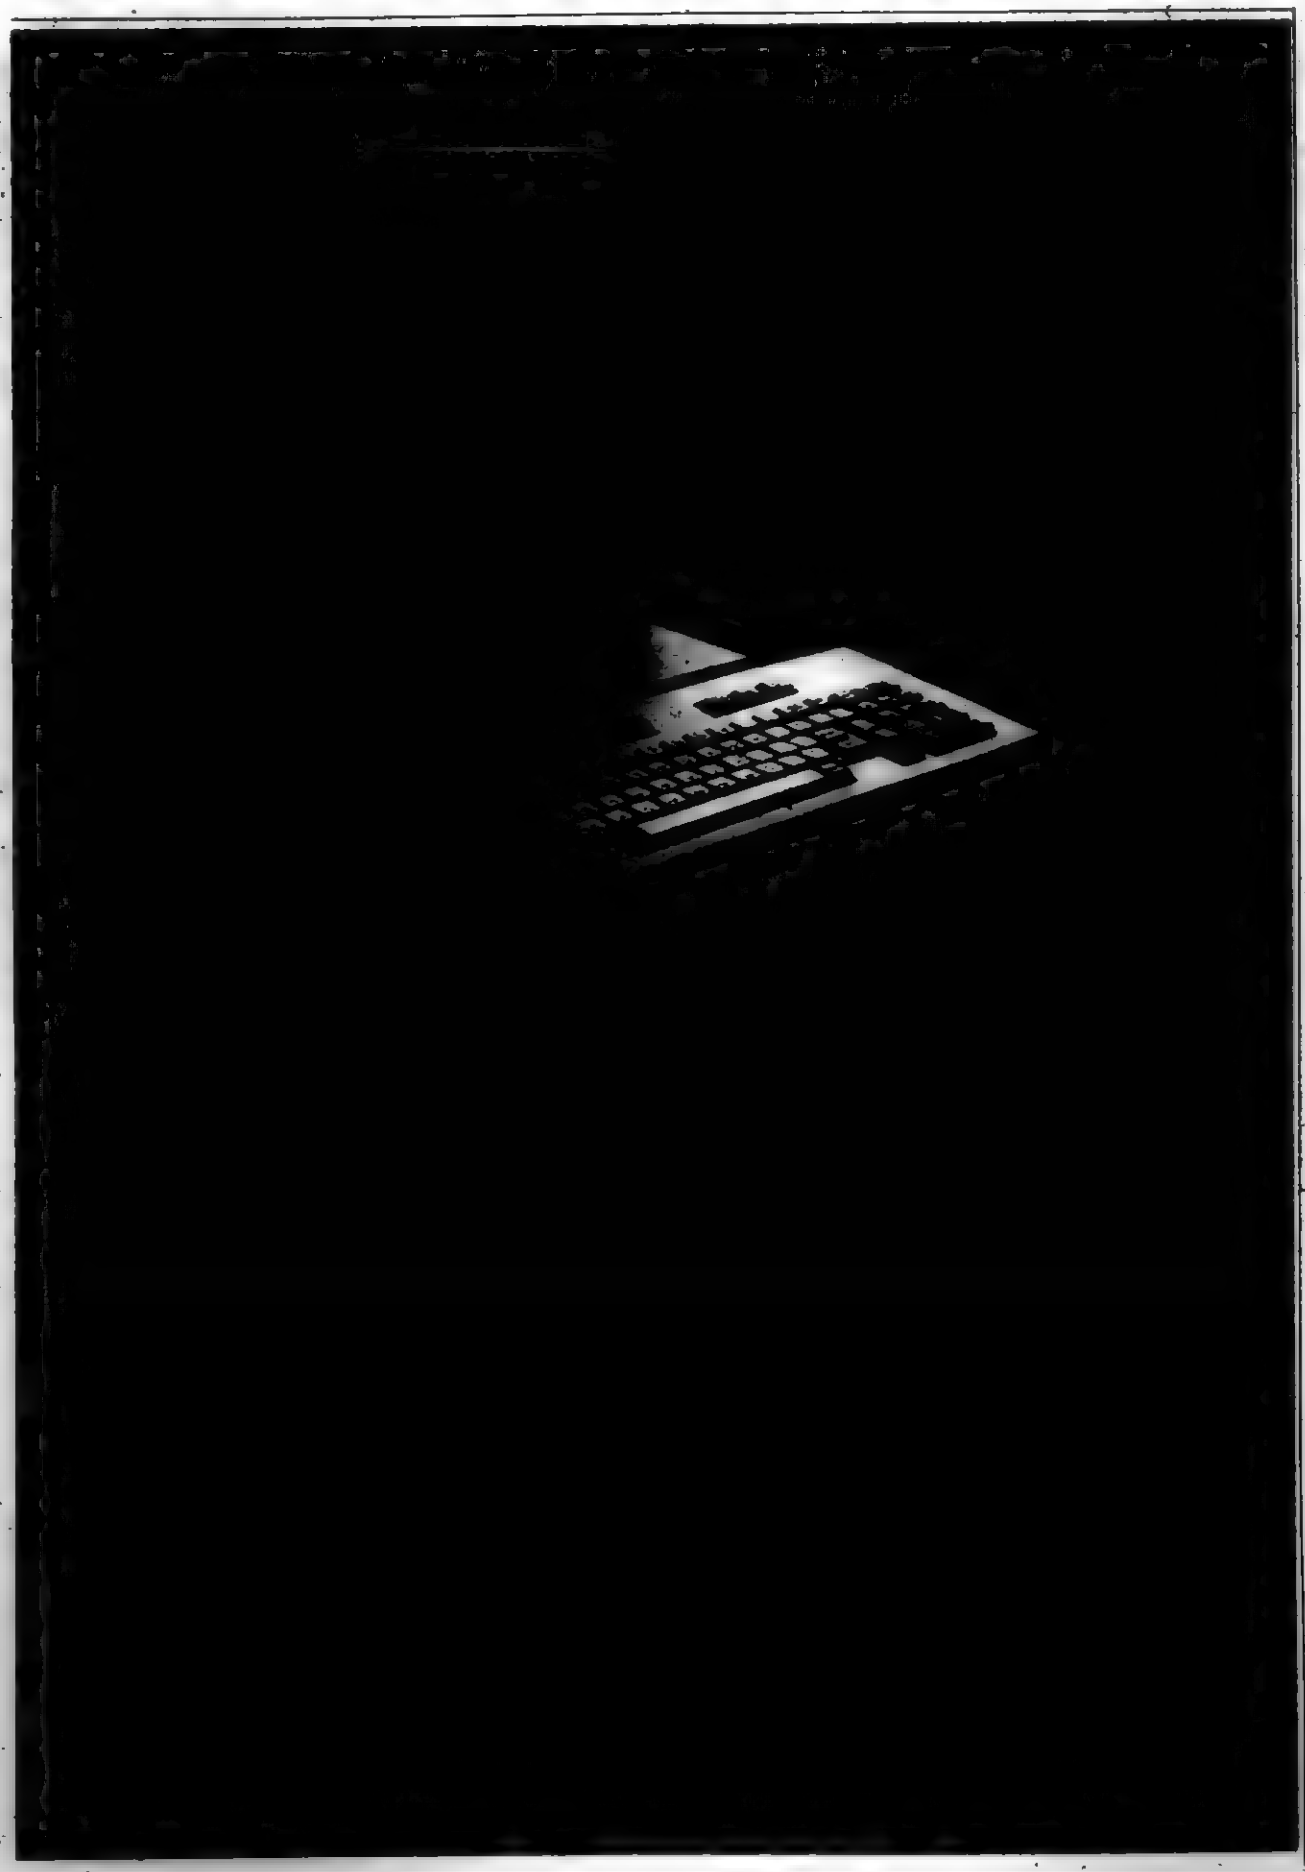
WASHINGTON, D.C. — Universal interconnection is the next major advance in electronic data interchange, according to T.J. O'Rourke, president of Tymshare, Inc.

He was among the speakers here last month at the annual meeting of the Transportation Data Coordination Committee (TDCC), which develops, maintains and promotes business use of electronic data interchange standards. Tymshare is a major supplier of on-line, computer-based communications/information services.

The first electronic data interchange standards, O'Rourke said, were "closed," limited to specified applications and required adherence to proprietary standards. Next came "open" systems, which did not require the use of any particular hardware, software or network service but did make adherence to a specific nonproprietary communications protocol mandatory. The grocery industry's Universal Communications Standard (UCS) is one such open standard, O'Rourke said.

He added that open systems are now beginning to be replaced by "generic standards," which contain the resources needed to resolve differences between user systems; thus, they make standards irrelevant. By promoting communications across company and industry boundaries, he expects generic standards to increase vastly electronic data interchange traffic.

At the TDCC meeting, Tymshare unveiled a service called Edi-Net which, according to O'Rourke, embodies a generic standard.



REPORT from page 19

ferencing, superintendance control, propaganda, education and television broadcasting, a spokesman said. The product, including projector, video control unit, power unit and screen, costs about $2 million.

OSAKA — Sharp Corp. has introduced two multifunction Japanese word processing/personal computers. The WD 2200 and WD 2700 can also be remotely connected to an IBM host computer and emulate IBM 3270 terminals, the vendor said. The WD 2700 also has image scanning capabilities, along with hard disk and ink jet printer options. The WD 2200 with a thermal printer costs $4,247, and the WD 2700 is priced at $7,872 with dot matrix printer and $9,362 with an ink jet printer.

MATSUMOTO — Epson Corp. and Suwa Seikosha Corp. Ltd. have jointly announced Skymirror SM-10, a microcomputer designed to capture weather information from weather satellites and instantly display the data on a personal computer. Floppy disk drives or cassettes can be used to play back the weather data as needed. The system, priced from $9,574, can also be used as a standalone Japanese word processor and personal computer.

NEW LIFE FOR
1401 PROGRAMS

CS-TRAN converts your 1401 *object* programs to COBOL for the mainframe or mini of your choice.

CS-TRAN is the *only* translator that accepts your object programs, patches and all, yet allows you to include actual COBOL paragraph names and record definitions.

If you'd like more details about new life for your 1401 programs just call or write Russ Sandberg.

C·S Computer Systems Inc.

Manville, NJ 08835 • 201-526-6000

HERO ARRIVES AS THOUSANDS CHEER!

THE PERSONAL COMPUTER: BOON OR BOMB? IT DEPENDS ON YOUR AIM.

The personal computer is a hit. Everyone wants one. The problem is, in a business organization, it's too personal. Every operator becomes an electronic freelancer, hoarding personal data. Incapable of, or unwilling to, exchange information with other computers.

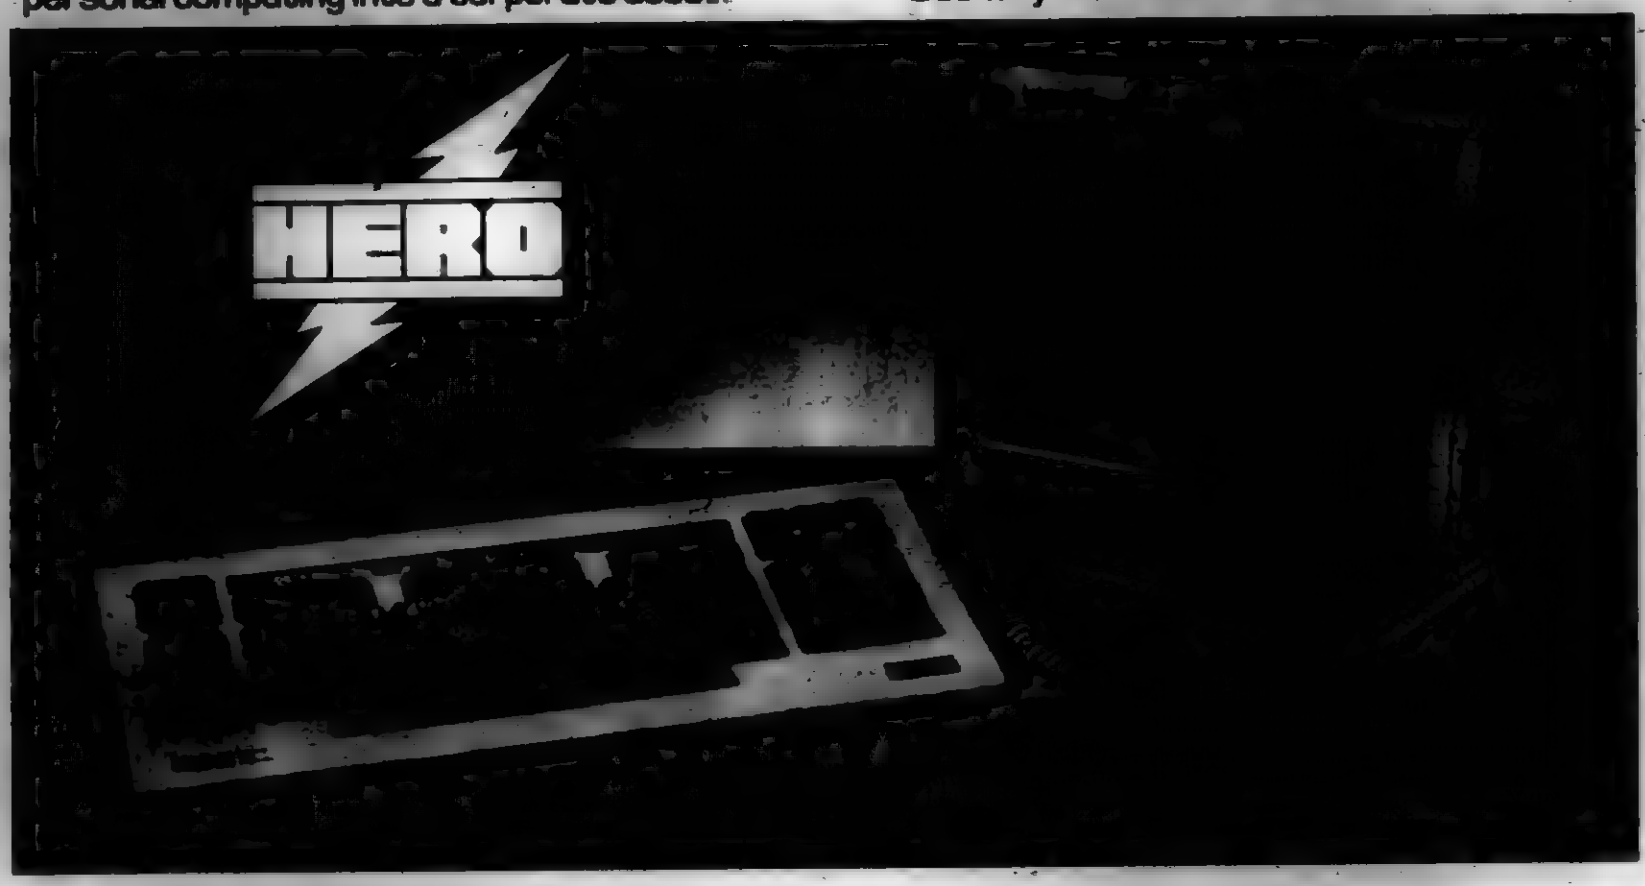
Work is lost or duplicated. Even triplicated. Which drives costs—and information managers—crazy. This is Computer Shock. Fortunately, Mohawk Data Sciences has the treatment.

ENTER THE HERO! NOT A MOMENT TOO SOON.

MDS® introduces HERO!™ the Networked Personal Computer. HERO is an intelligent desktop workstation. The heart of a HERO is a 16-bit microprocessor. Its magic transforms personal computing into a corporate asset.

In HERO, MDS offers a personal computer with the ability to contribute to, and draw from, an entire organizational information network. Integration replaces disintegration.

See why we named it HERO?



INFORMATION FLOW THAT WAS NOT WORKING WILL NOW BE NETWORKING.

No more isolated little fiefdoms. No more anarchy. No more lack of central control. Coordinated with the MDS Communications Processor, HERO ties your information network together. Individual workstations can talk to each other. They can draw from departmental and corporate sources. And vice versa.

You keep your current network and HERO improves it. Your people keep their current jobs. They just do them better. Your investment is not only protected, it works harder.

And it all works for you.

MDS MERGES WITH IBM.

HERO marries compatibly into IBM networks. Using the MDS Communications Processor, HERO can talk with IBM mainframe computers. It's engineered to look like IBM 3270 SNA or 3776 remote job-entry systems. And our MDS Super SNA option lets you have both on one communications link. Most IBM and non-IBM protocols are available, including binary synchronous, asynchronous and X.25.

Only MDS offers you INTELLIGENT 3270.™ It integrates the intelligence of HERO with the intelligence of the host. User-written HERO programs can draw data from the host, process it, update it and return it. Or store it locally.

HERO DOES EVERYTHING A PERSONAL COMPUTER DOES. ONLY MORE HEROICALLY.

Since it's engineered to help you make decisions, HERO naturally provides word processing, financial spreadsheets, scheduling, analysis and planning functions. And it can run software under MS-DOS.

HERO is multilingual. It can understand programs written in FORTRAN, PASCAL and BASIC. As well as existing MDS Series 21® programs written in COBOL and MOBOL (Mohawk Business Oriented Language).

HERO HAS BRAINS TO MATCH ITS LOOKS.

With HERO's 16-bit processor comes memory expandable from 256K to one megabyte, with private disk storage up to 80 megabytes.

HERO is small, light and handsome. It fits snugly on the corner of a desk, and has the quiet, impressive good looks which inevitably find their way into the corner office.

Memory and storage modules are textbook size. They tuck away under a desk. With MDS, out of sight is never out of memory.

MDS SAVES YOU MONEY IN THE PROCESSING.

The MDS SUPER 21™ Communications Processor can cluster as many as 16 HEROS to a shared database. Each workstation shares the same disk drives, tape drives, printers, modems and communications lines.

And you share the savings. SUPER 21 provides two communications ports that operate simultaneously. It can talk to two different mainframes in two different protocols at once.

HERO TODAY, HERO TOMORROW.

HERO is designed to grow with your system. The modular sections are made to snap together. So it's a snap for a user to assemble, install and repair.

Built-in diagnostic "confidence tests" give you a sequential read-out, verifying that your HERO is healthy and ready to go.

If you need help, MDS staffs over 1,500 Field Engineers in hundreds of locations around the world, around the clock. Whatever your needs, we'll work out a maintenance plan that suits you.

THE MDS PHILOSOPHY: UNITE AND CONQUER.

Twenty years ago, MDS set out to devise programs linking business systems together. Not just office automation—word processors and personal computing. Rather, automation for entire organizations: sophisticated networks linking remote locations together.

Over the years, by listening to our users and by responding to their specific networking needs, we've become acknowledged experts in automating the organization. By making this responsiveness our number-one priority, MDS has become a multidivisional, multinational networking organization.

We'd like to help you do the same. If you want to know more, we suggest two informed sources:

(1) Talk to our customers.
(2) Call us at **800-MDS-HERO.**

MDS HERO WILL MAKE A HERO OUT OF YOU.

MDS MOHAWK DATA SCIENCES

7 Century Drive, Parsippany, NJ and over 430 locations worldwide.

ICA seminar set for Jan. 15-18 in Fort Lauderdale

Theme of meet — integrating the digital office

FORT LAUDERDALE, Fla. — The International Communications Association (ICA) will hold a seminar on digital telecommunications technology trends in management on Jan. 15-18 at the Fort Lauderdale Marriott Hotel and Marina.

The theme of the seminar will be "Integrating the Digital Office," focusing on alternatives for merging installed components of office automation into a unified system. The meeting will include a series of intensive sessions exploring a range of issues relating to digital technology and its implementation.

According to an ICA spokesman, seminar topics will deal with technical and management aspects of digital private branch exchange (PBX), transmission methods to interconnect advanced devices, evolving digital network standards and trade-offs related to bypassing local telephone company facilities.

The impact of deregulation will be examined in several sessions dealing with the divested local phone companies, the spokesman said.

The tuition fee for the seminar is $425 for ICA members and $450 for others. More information about the seminar is available from ICA headquarters at Suite 828, LB-89, 12750 Merit Drive, Dallas, Texas 75251.

The Micro Solution

Finally, there is a total solution for your microfloppy needs . . .

The Dysan 3¼" Flex Diskette.™

It assures a source of high quality duplication services from Dysan's established production facilities.

It includes both alignment and Dysan's exclusive Digital Diagnostic Diskettes (DDD) for trouble-free drive operation and media interchangeability.

It utilizes a high performance, cost-effective and widely available media, selected specifically for minifloppy plug compatibility.

Its flexible jacket bends without damage, and optimizes media lifetime in contaminated environments.

It is from the same company who standardized the minifloppy with Shugart and the 5.25" Winchester drive with Seagate.

Considering supporting services, minifloppy compatibility, product availability and proven performance, it's apparent there is only one complete microfloppy standard.

The Dysan 3¼" Flex Diskette.

3¼" Flex Diskette is a registered trademark of Dysan Corporation.

AT&T chief to speak

NEW YORK — Charles L. Brown, chief executive officer and chairman of AT&T, will keynote a seminar here Jan. 26-27 on the business, legal and regulatory strategies of telecommunications companies.

"The New Telecommunications Landscape: The Companies Speak on the World of 1984 and Beyond" will be held at the New York Hilton by the *Legal Times* and Law & Business, Inc./Harcourt Brace Jovanovich, Publishers. Key executives from a variety of telecommunications companies and speakers from government, legal, financial and consulting organizations will participate.

Registration, including lunch and a reception, is $425 per person ($335 for representatives of nonprofit and government organizations).

Additional information is available from Law & Business/Harcourt Brace Jovanovich, 757 Third Ave., New York, N.Y. 10017.

Telexchange to hold meet

SAN FRANCISCO — The Fourth International Telexchange Meeting, scheduled at the Westin St. Francis Hotel here Jan. 16-18, will focus on system security, high-resolution computer graphics and micro-to-mainframe integration using Telefile Computer Products, Inc. and Xerox Corp. Sigma systems.

Sponsored by Telexchange, the Telefile Computer Users Group, the conference will also feature discussions on performance monitoring, state-of-the-art hardware and software development and additions to the users group library.

There will also be general business meetings and special-interest group meetings at the conference.

Registration costs $200. More information is available from Telexchange, 17131 Daimler St., Irvine, Calif. 92714.

Interest bonus proves bogus for bank's customers

By James Connolly
CW Staff

COLUMBUS, Ohio — Some savings account customers at the Ohio State Federal Savings and Loan Association here recently got a surprise bonus in their passbooks. But their good fortune was nullified quickly by the computers that created it.

A misunderstanding between a service bureau and the bank caused computers to credit $100,000 to $200,000 in extra interest to more than 2,000 customers. The bank reclaimed that money within a week from disappointed but "understanding" savers.

"To this point, reaction from customers has been pretty understanding, once they knew what the situation was," said Stanley Spencer, vice-president for communications at Citizens Federal Savings and Loan Association, Ohio State's Dayton-based parent company. "Even most of the negative reaction was just, 'How did this happen?' When we explained it, they understood.

"It was just one of those freak things."

The error had its roots in the merger of the banks last year, when Citizens Federal, which used an NCR Corp. 8500 financial system, took over Ohio State Federal Savings, which utilized a Burroughs Corp. B4890 system through the Savings and Loan Data Center in Cincinnati.

Spencer said that Citizens Federal allowed a year to integrate Ohio State into the NCR system. Oct. 22, a Sunday, was chosen as the conversion date. "What happened was that they were projecting the interest a customer would earn through the end of the interest cycle, rather than cutting it off on Sunday," Spencer explained.

The data center continued crediting accounts through the week of Oct. 22, although the host computer at Citizens Federal was crediting interest as of the 22rd.

At the end of the week, when Citizens Federal received reports from the data center, officials noticed the excess interest paid. The extra interest averaged less than $50 per customer and probably did not exceed $200 for any single customer, Spencer said.

After discovering the error, the bank sent letters to between 2,000 and 3,000 Ohio State customers explaining the situation. Accounts were then reduced by the appropriate sum.

Spencer said the bank lost "little" money through customers closing accounts before the error was found.

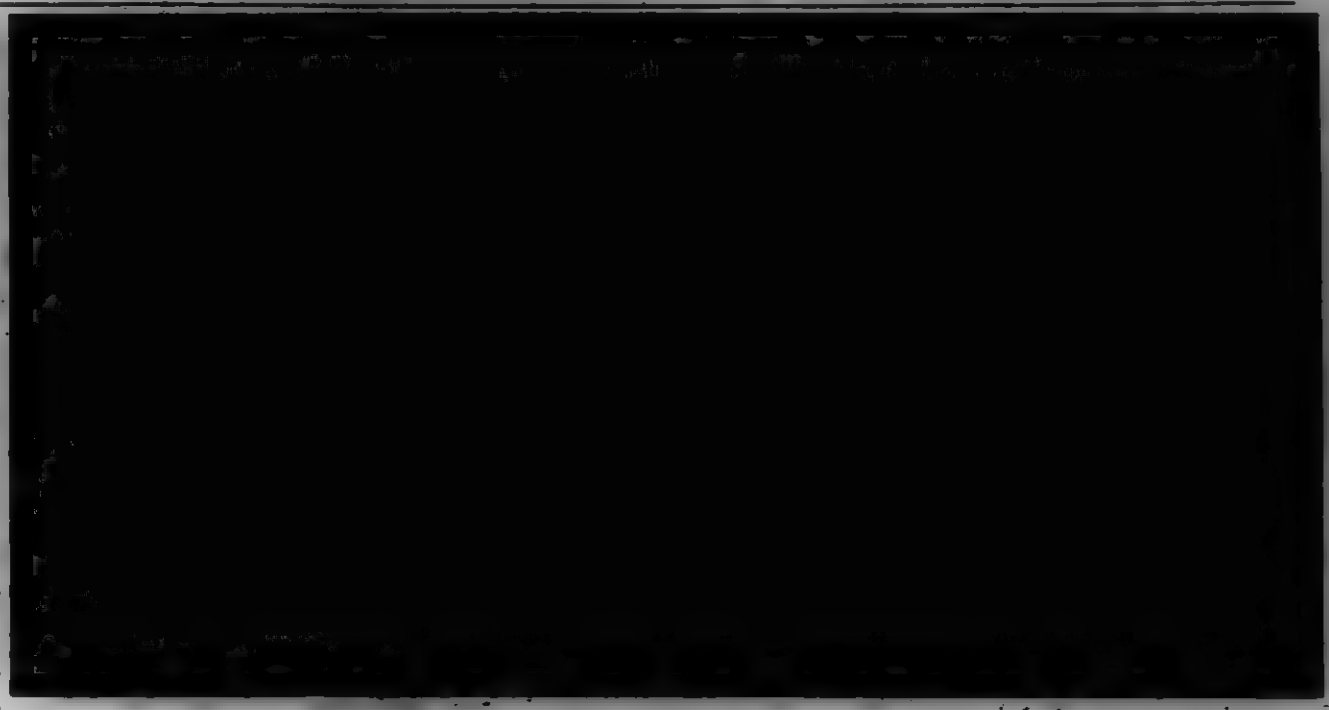
Meet to cover fiber optics

MADISON, Wis. — A three-day program on the "Design of Fiber-Optic Communications Systems" will be held here March 12-14 at the University of Wisconsin Extension.

The program is structured to assist the design engineer and experienced technical personnel in the understanding and design of fiber optics in communications systems.

The program will be presented by industry leaders and will address subjects of fiber parameters, receivers and transmitters, optical measuring techniques, link design, cable installations and broadband applications.

The fee is $475. Further information is available from the Department of Engineering & Applied Science, University of Wisconsin Extension, 432 N. Lake St., Madison, Wis. 53706.



It's time the technology of data collection caught up to the technology of data processing.

The speed of your data processing is limited by the speed of your data collection and input. Unfortunately, for a lot of people, data collection technology stopped with the development of the clipboard.

But MSI has changed all that.

Because MSI portable data collection systems are microprocessor-based answers to multipart forms. They actually extend the power of your central computer by allowing data to be keyed in right in the field. And then transmitted over ordinary phone lines to a host computer or data processing center.

MSI systems eliminate paper shuffling, keypunching, and errors by collecting data at its source. At the same time, we return control to the data processing department, eliminate costly time delays, and match the sophistication of your central system with our equally sophisticated remote system.

Our family of hand-held terminals can be used anywhere there's data to be collected. For salesman order entry, inventory control, financial reporting, manufacturing control, and field data collection tasks of all kinds.

Learn how MSI data collection products can bring your system to the peak of its capabilities. Just return the coupon.

You'll find the technology of data collection is right where you want it.

MANAGERS ON THE MOVE

BURT MALL has been appointed director of data processing at Intermatic, Inc. in Spring Grove, Ill.

Mall moved to Intermatic — manufacturer of automatic timers, outdoor lighting and heaters — from A.G. Becker Paribas, Chicago investment bankers, where he was manager of operations analysis. Prior to that, he was manager of data processing for 10 years at Northern Petrochemical Co., Inc., a division of Internorth Corp. in Des Plains, Ill.

Mall is a graduate of the Southern Illinois University in Carbondale with a B.A. in psychology and a minor in mathematics. He has completed work toward an MBA at Northern Illinois University in De Kalb, Ill.

■

CHARLES E. WOOD has been promoted to vice-president of information systems in the tire division of Copper Tire & Rubber Co. in Findlay, Ohio. Besides continuing to be responsible for computer operations, operations research and analysis, systems and systems planning, computer programming and office equipment, Wood gains additional responsibility as planning coordinator on the division's executive staff.

Wood was director of Cooper's data processing department from 1969 to this year, when the department was reorganized as Information Systems. He has held various managerial and supervisory positions in the systems and data processing areas since joining the company in 1959.

Wood holds a B.S. from Findlay College. He completed an advanced management program at Bowling Green State University in 1976 and has done graduate work there since 1980.

■

LEON B. BILLIS has been elected vice-president of The Equitable Life Assurance Society of the U.S. in New York. He will be responsible for planning for the company's computer centers.

Billis joined Equitable in 1963 as an operator in the data processing department. He was named a senior systems specialist in 1975, manager of the Technical Division in 1977 and manager of the Planning Division in 1978. He was elected assistant vice-president in 1980.

He is a 1974 graduate of Baruch College with a B.A. in business management. He received his MBA in executive management from St. John's University in 1970.

■

ALBERT A. SINISI JR. has been promoted to executive associate to the vice-president and director of technology resource management at Thomas Jefferson University in Philadelphia. In his new role, Sinisi will address issues governing the impact on Jefferson of new and advanced technologies. He will have general responsibility for recommending to the senior officers the policies and processes by which the university will manage the acquisition and assimilation of new technologies.

Sinisi

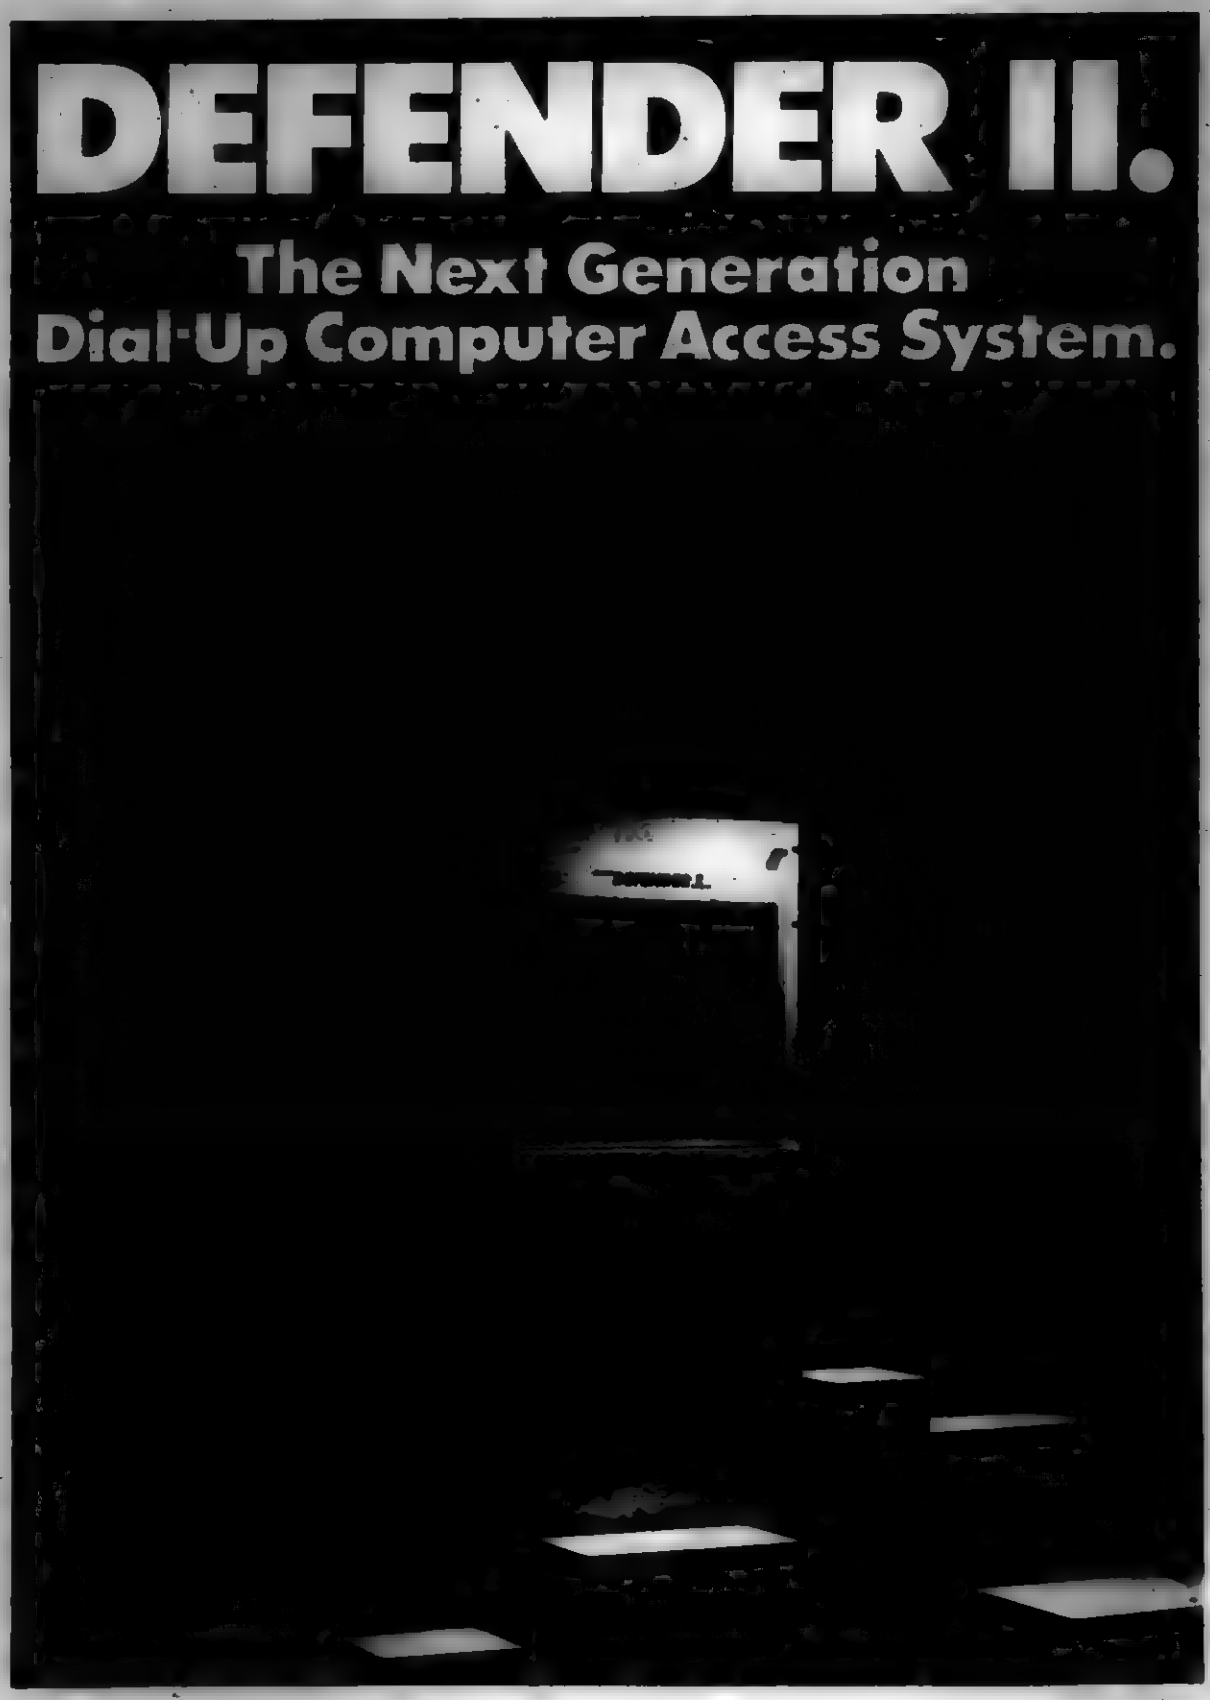
In his new post, Sinisi will be responsible for technology forecasting and planning, generally defining the capital, operating and human resources requirements of technology acquisition and coordinating the integration of complementary technologies, such as telecommunications and data processing. He will retain responsibility for completing Jefferson's new electronic data processing plan and will serve as the chairman of the technological subcommittee of the university's telecommunications committee.

Sinisi began his career at Jefferson in 1970 as a project manager in information systems and was promoted three years later to associate director, a position he held for the next five years before becoming director.

Prior to his work at Jefferson, Sinisi was a systems analyst at the General Electric Co.

In addition to his responsibilities at Jefferson, Sinisi is currently a member of the Mayor of Philadelphia's Advisory Board for Information Management.

He is a graduate of St. Louis University with a B.S. in aeronautics. He obtained his master's degree in business administration at Widener University in Chester, Pa.



Graphics, CAD/CAM covered by directory

CHERRY HILL, N.J. — Data Decisions, Inc. has published a directory of 66 graphics and computer-aided design and manufacturing (CAD/CAM) packages produced by 34 vendors. The packages run on mainframes, minicomputers and microcomputers.

Product descriptions are alphabetically arranged, preceded by a reference chart. It describes intended users, lists operating systems required and highlights functions and options.

The report, "Graphics and CAD/CAM," is available for $29 from the vendor.

Data Decisions is headquartered at 20 Brace Road, Cherry Hill, N.J. 08034.

Computer chess champions

'Cray Blitz' wins chess trophy

NEW YORK — Belle, a seasoned champion, was unbeaten in 27 consecutive matches. Former champion Nuchess was in fine shape and looking for revenge. Built for speed, Cray Blitz was the top threat among the 20 other contenders.

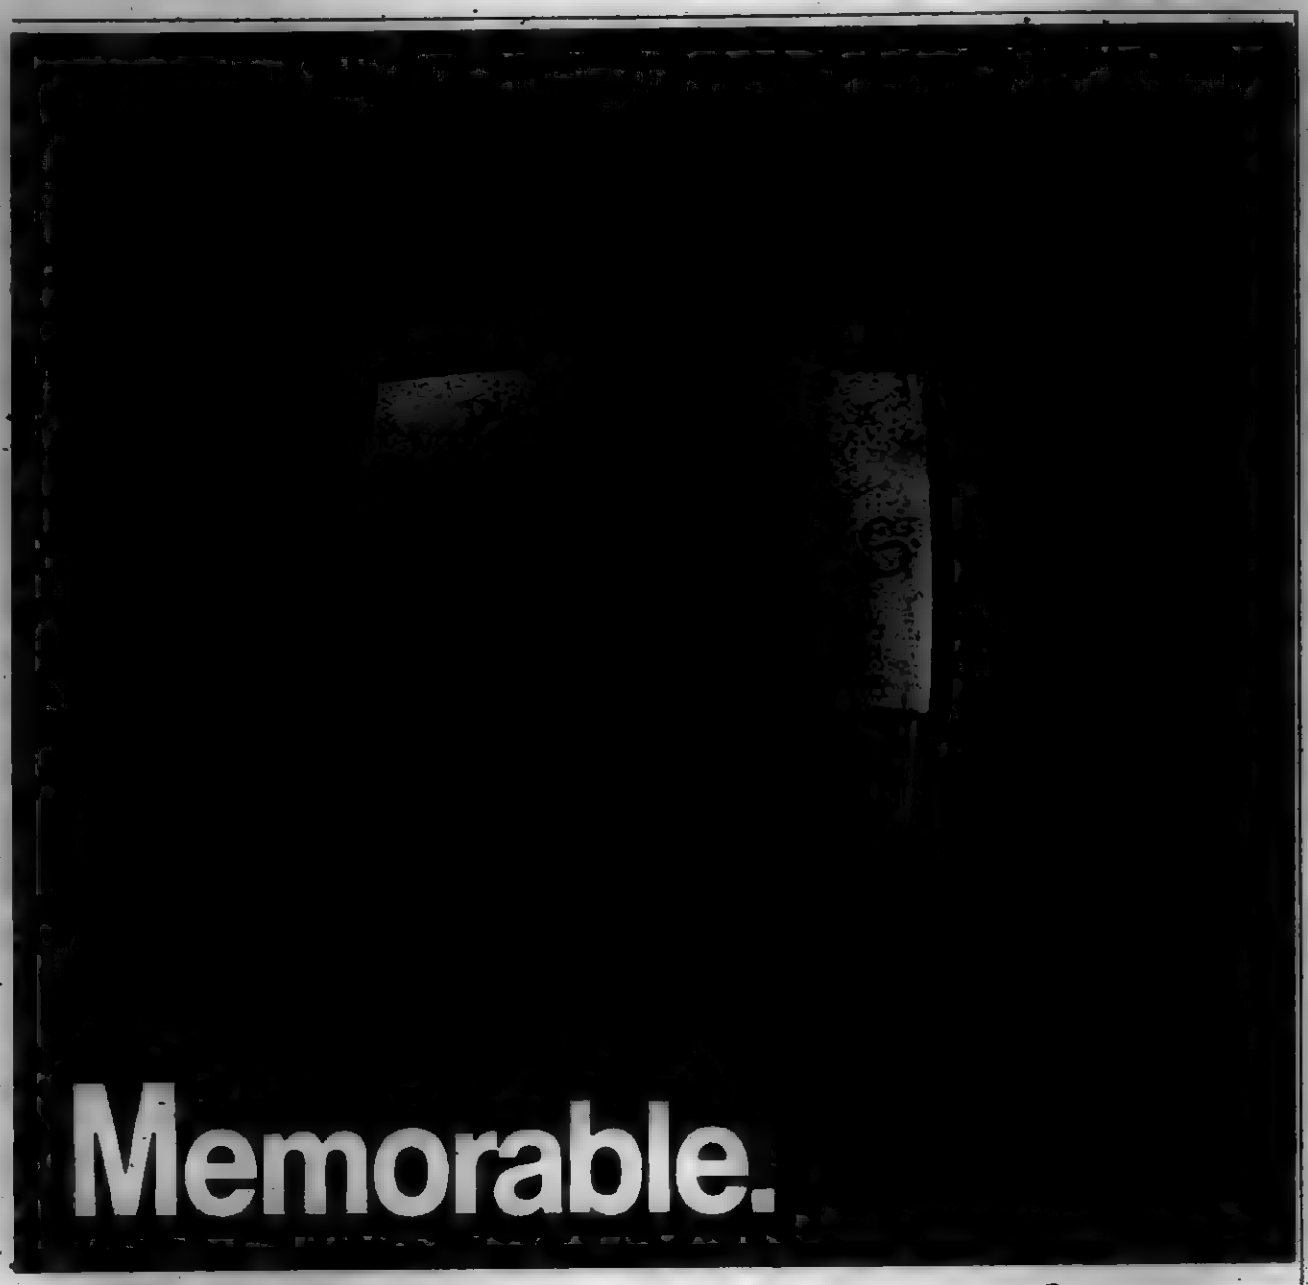
After the dust had cleared at the triennial World Computer Chess Championship, held here in conjunction with the recent Association for Computing Machinery meeting, the developers of the Cray Blitz computer chess program walked off with the top trophy.

About half of the programs competing against each other for the crown of World Computer Chess champ were played on microcomputers. Although some of those micro-based contenders fought hard, they proved in the end no match for their bigger foes, some of which employed more than one processing unit.

Triumph over Belle

Cray Blitz, which runs on a Cray Research, Inc. Cray-1/M series processor, battled to a draw with 1977 champion Nuchess in the tourney's fourth round and triumphed over 1980 champ Belle in the final round en route to the championship. The developers of the Cray Blitz program, Dr. Eugene Moore and Dr. Robert Hyatt of the University of Southern Mississippi, faced challengers from eight nations, including Canada, England, West Germany and Austria.

The loss of the title was particularly bitter for Belle, which operates on a Digital Equipment Corp. PDP-11/23 processor, as the U.S. Chess Federation had only recently recognized the former champion as the first chess program worthy of a national master rating.



With 3M diskettes, your computer never forgets.

3M diskettes remember everything, every time. Because at 3M, reliability is built into every diskette. We've been in the computer media business for over 30 years. And we've never settled in. We're constantly improving and perfecting our product line, from computer tape and data cartridges to floppy disks.

3M diskettes are made at 3M. That way, we have complete control over the entire manufacturing process. And you can have complete confidence in the reliability of every 3M diskette you buy.

Look in the Yellow Pages under Computer Supplies and Parts for the 3M distributor nearest you. In Canada, write 3M Canada, Inc., London, Ontario. If it's worth remembering, it's worth 3M diskettes.

3M hears you...

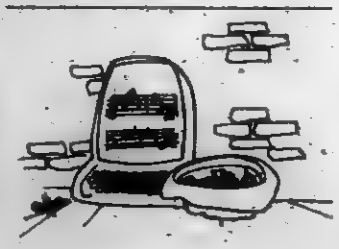
Journal covers Fortran's 25th

RESTON, Va. — The January 1984 issue of the *Annals of the History of Computing*, a quarterly journal published by the American Federation of Information Processing Societies, Inc. (Afips), is a special issue covering Fortran's 25th anniversary.

The issue contains 14 articles by original developers and users of Fortran, a widely used high-level programming language. Articles include "Early Computers and Computing Institutions," "Computing Prior to Fortran," "Early Fortran User Experience" and "The Impact of Fortran Standardization."

Single copies cost $10-$20. A one-year subscription to Annals costs $22 (members of Afips Constituent Societies), $30 to nonmembers and $50 to institutions.

Further information is available from Afips Press, 1899 Preston White Blvd., Reston, Va. 22091.



FIRST CONCEPT TECHNOLOGIES, INC.

Announces

INTERCHANGE/1

The complete Micro to Mainframe Data Link.
Available for installation TODAY.

INTERCHANGE/1 allows personal computer users complete access to mainframe data. PC programs can treat that data as if it were actually stored on the personal computer. ADABAS, IDMS, TOTAL and VSAM files can be accessed with simple GET, INSERT, UPDATE and DELETE commands, from standard PC programming languages.

INTERCHANGE/1 is the complete micro to mainframe link. It requires no special PC "database language", but instead extends PC BASIC and PASCAL by adding database manipulation commands. Several mainframe files may be accessed from a single PC program.

INTERCHANGE/1 supplies records on request, without the need for full file transfer, just as normal PC file processing does. It also allows sophisticated data "queries" through its programmatic "GET MATCH" command. You supply the criteria, INTERCHANGE/1 returns only those records which meet that criteria.

Where full file transfer is necessary **INTERCHANGE/1** provides both an UPLOAD and a DOWNLOAD utility. UPLOAD can be used to enter records interactively from the PC, or to transfer records from a PC file to the mainframe database. DOWNLOAD will allow transfer of mainframe files to the PC and will even prompt for MATCH criteria so that only the desired records are transferred.

INTERCHANGE/1 includes both the micro and mainframe interface. No user written mainframe program is required. Full mainframe security is provided and can be controlled at the central computer. The Data Center determines which fields in a file may be accessed by a particular user and assigns passwords to control the level of access (READ-ONLY, UPDATE, INSERT/DELETE).

INTERCHANGE/1 is a true micro to mainframe interface because it treats the microcomputer as an equal, not as a 3270 terminal.

INTERCHANGE/1 is the first in our CONTINUUM series of products for Distributed Data Processing (DDP). We are committed to supporting a true DDP environment.

INTERCHANGE/1 forms the basis for an integrated distributed resource system.

INTERCHANGE/1 currently supports mainframe ADABAS, IDMS, TOTAL and VSAM files and interfaces with the IBM Personal Computer. Support for additional mainframe database products, additional microcomputers (Apple, Wang) and additional "mainframes" (VAX, BURROUGHS, DATA GENERAL) are under development. Call us for details or special requests. If we don't have it now, we will build it for you.

Within the next several months, at least a dozen micro/mainframe links will be announced by other manufacturers. To help you in evaluating the products which have been, or will be announced, we have prepared a booklet, in easy to understand "laymen's" terms, titled:

"All you need to Know about the
Micro to Mainframe Link --
Questions to ask your vendor."

The booklet describes what is necessary in a true micro to mainframe link, and explains some of the terms used to describe the various versions available. It will help you to determine what level of link you require for your environment.

For your free copy of our booklet call Toll Free
1-800-448-3400
or
1-800-962-5000 (in New York)
or return the coupon provided below

To futher assist your finding a product to meet your needs, WE have provided a list of those vendors we know who have already announced or will be announcing some form of micro to mainframe link. It is not exhaustive, and WE invite any vendor we miss to let us know, so we can include them in our next ad.

"Our Competition"

Cincom Systems, Inc. (Cincinnati, Oh.)
Computer Automation (Richardson, Tx.)
Computer Corporation of America (Cambridge, Ma.)
Cullinet Software (Westwood, Ma.)

CORPORATE HEADQUARTERS

TURNAROUND TIME

LARRY E. LONG

Q I was moved from development work into management information systems (MIS) planning about 18 months ago. Since that time I have completed two MIS plans. One was operational, and the other was in response to top management's request for a strategic plan for MIS.

Both plans have been well-received in the MIS department, but top management thinks our MIS strategic plan is still too operational. I've been asked by the director of MIS to revise the last plan to emphasize strategic planning. Do you have any suggestions about how to proceed?

A Many MIS "strategic" plans are no more than management summaries of more detailed operational plans that concentrate on new systems development, major enhancements and hardware upgrades. Top management's response to your strategic plan indicates to me that you may have fallen into this same trap.

You may be better off starting from scratch than trying to revise the MIS strategic plan. At this point, top management is not going to be satisfied with a revised operational plan. They want a plan that articulates those MIS strategies that are consistent with, and complementary to, corporate objectives.

If you haven't already done so, review the corporate strategic plan to see if it identifies any directions for MIS (often it does not). Invite input from corporate planners. Follow any corporate planning guidelines to the extent possible.

Keep in mind that top management wants a strategic plan that focuses on what has to be done to achieve specific results. Through a series of discussions with top management and MIS managers, derive a consensus of what the function of MIS is to be. Then set a series of strategic objectives.

In the plan, accompany each strategic objective with a brief explanation of how that objective is to be met. Each major planning area (systems, hardware, personnel, operations, communications and so on) should be supported by at least one strategic objective.

For example, the strategic objectives for information systems planning might be to integrate existing and proposed information systems in a data base environment and to emphasize user friendliness and distributed data processing in systems design.

Finally, keep it to 20 pages or less.

Q I've conducted several in-house training sessions over the last three years on data base management and structured design. I enjoy teaching and would like to know what the career opportunities are in colleges and universities. Are there opportunities for part-time instructors?

A Academe is experiencing a desperate shortage of data processing and computer science instructors. In all likelihood, you need look no further than local institutions to find openings. Recruitment of both full-time and part-time faculty has become an ongoing task in most departments.

Q I'd like to add some specifics to your response to a person who was doomed to documenting dinosaurs. We follow these guidelines in updating the documentation of old systems and programs that have no documentation or poor documentation:

1. Documenting the data flow is more important than documenting the programs.
2. Set a time for documenting a system.
3. Begin with the identification of all programs (not program internals).
4. Compile data flow diagrams showing all I/O for each program (files, data sets, reports and screens).
5. Now, if time permits, identify the worst programs and list the programming tricks that they use.

A Your guidelines are good, but allow yourself enough flexibility to spend more time on the redocumentation of old systems that are extremely volatile and critical to organizational operation (and sometimes survival). Give these dynamic systems more attention than the relatively stable systems that have cumbersome but acceptable documentation.

Q I would like to work in Europe or perhaps South America for a few years, while I'm still young and unattached. I have five years' experience as a programmer/analyst. Will I be able to find a job?

A The best opportunities for employment are in the Third World countries and countries with oil-based economies. Jobs and work visas are more difficult to obtain in industrialized Europe.

Nationalism is strong in most countries, and employers prefer to hire their own, when possible. To get your foot in the door, you will probably need to demonstrate a specialized expertise and facility with the language. The oil countries are less demanding.

Long is a professor at Lehigh University, a DP consultant and author. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, P.O. Box 880, Framingham, Mass. 01701.

NEW TANDY TRS-80® MODEL 2000

The ultra-high performance MS-DOS system that operates at over twice the speed of the IBM PC.

Introducing a new standard in MS-DOS based computers—the Tandy 2000 Personal Computer.

Tandy 2000 uses today's most popular and sophisticated MS-DOS based programs. And since Tandy 2000 runs at over twice the speed of the IBM PC, you can get the job done quicker.

You can store twice as much data on Tandy 2000's two built-in disk drives as you can on IBM PC, COMPAQ, or TI Professional drives. And you can handle bigger jobs, since our memory expands to 768,000 bytes.

Tandy 2000's video display is truly stunning. Our color graphics have up to twice the resolution of the others, and up to twice as many colors.

And not only does the Tandy 2000 take up less desk space, it also costs less*.

Service? Radio Shack's is second to none—total hardware and software support nationwide.

Best of all, the Tandy 2000 is available today at over 1000 Radio Shack Computer Centers and at participating Radio Shack stores and dealers nationwide.

Tandy 2000 With Two Disk Drives **2750.00** 25-5103

Non-interlaced monitor, Digi®-Mouse and graphics not included

Commercial Lease Available For Only $95 Per Month (Plus Applicable Use/Sales Tax)

WHEN YOU'VE GOT TO BE RIGHT

In business, being right is what it's all about. Right in the decisions you make, right in the equipment you select to help you make those decisions.

AT&T Information Systems can help you be right. Now more than ever before.

As of January 1st, all our business communications equipment is for sale or for lease. Whether it is equipment you already have, or additional equipment you might need. We offer everything from basic business phones to the most sophisticated voice and data systems in the industry. And you can buy them at competitive prices that are consistent nationwide. Simply give us a call to discuss all the options available to you.

Also on January 1st, our service and sales forces were integrated, united into the largest organization of its kind anywhere. There are 206 branch offices across the country. Plus 79 Business Service and Sales Centers.

No matter what size your business, we'll help you with planning, installation and maintenance. Before, during, and after the sale.

What else is new? A new spirit of competitiveness throughout the company, from top to bottom. A new dedication to the idea of providing you with better products and better service. On faster timetables.

A few things haven't changed. We're still supported by the genius of AT&T Bell Labs, plus the benefits of more than 100 years of communications experience.

Before you make decisions vital to moving your business ahead, talk with us. **AT&T INFORMATION SYSTEMS. 1-800-247-1212.**

It's worth your while, when you've got to be right.

Speaker cites next decade's concerns, players

By John Gallant
CW Staff

NEWTON, Mass. — Communications capabilities, computing power and memory will become increasingly inexpensive, but programming costs will be the fly in the ointment in the DP marketplace of the next decade, according to an industry expert who spoke here recently.

In addition, Robert G. Gilbertson Sr., president and chief executive officer of Data Switch Corp. of Norwalk, Conn., told the Boston Society for Information Management that IBM will "continue to cast a heavy shadow in the computer industry" with even more aggressive pricing and the introduction of new products.

According to Gilbertson, IBM's increasing dominance does not bode well for "the seven dwarves" — the mainframe vendors that do not make IBM plug-compatible machines.

IBM to dominate

"We will be dominated even more by IBM in the 1980s than we have been in the past. Within its corporate structure, IBM has created organizational groups that are designed to attack any chosen market through whatever means available. We've seen that clearly with the Personal Computer, and I think you'll see it with local-area networks also," said Gilbertson, a former IBM executive and faculty member of the Harvard Business School.

"In the mainframe market," he forecast, "it's clear that one or more of the non-plug-compatible manufacturers will retire by 1986 — and the first will probably be [Honeywell, Inc.]."

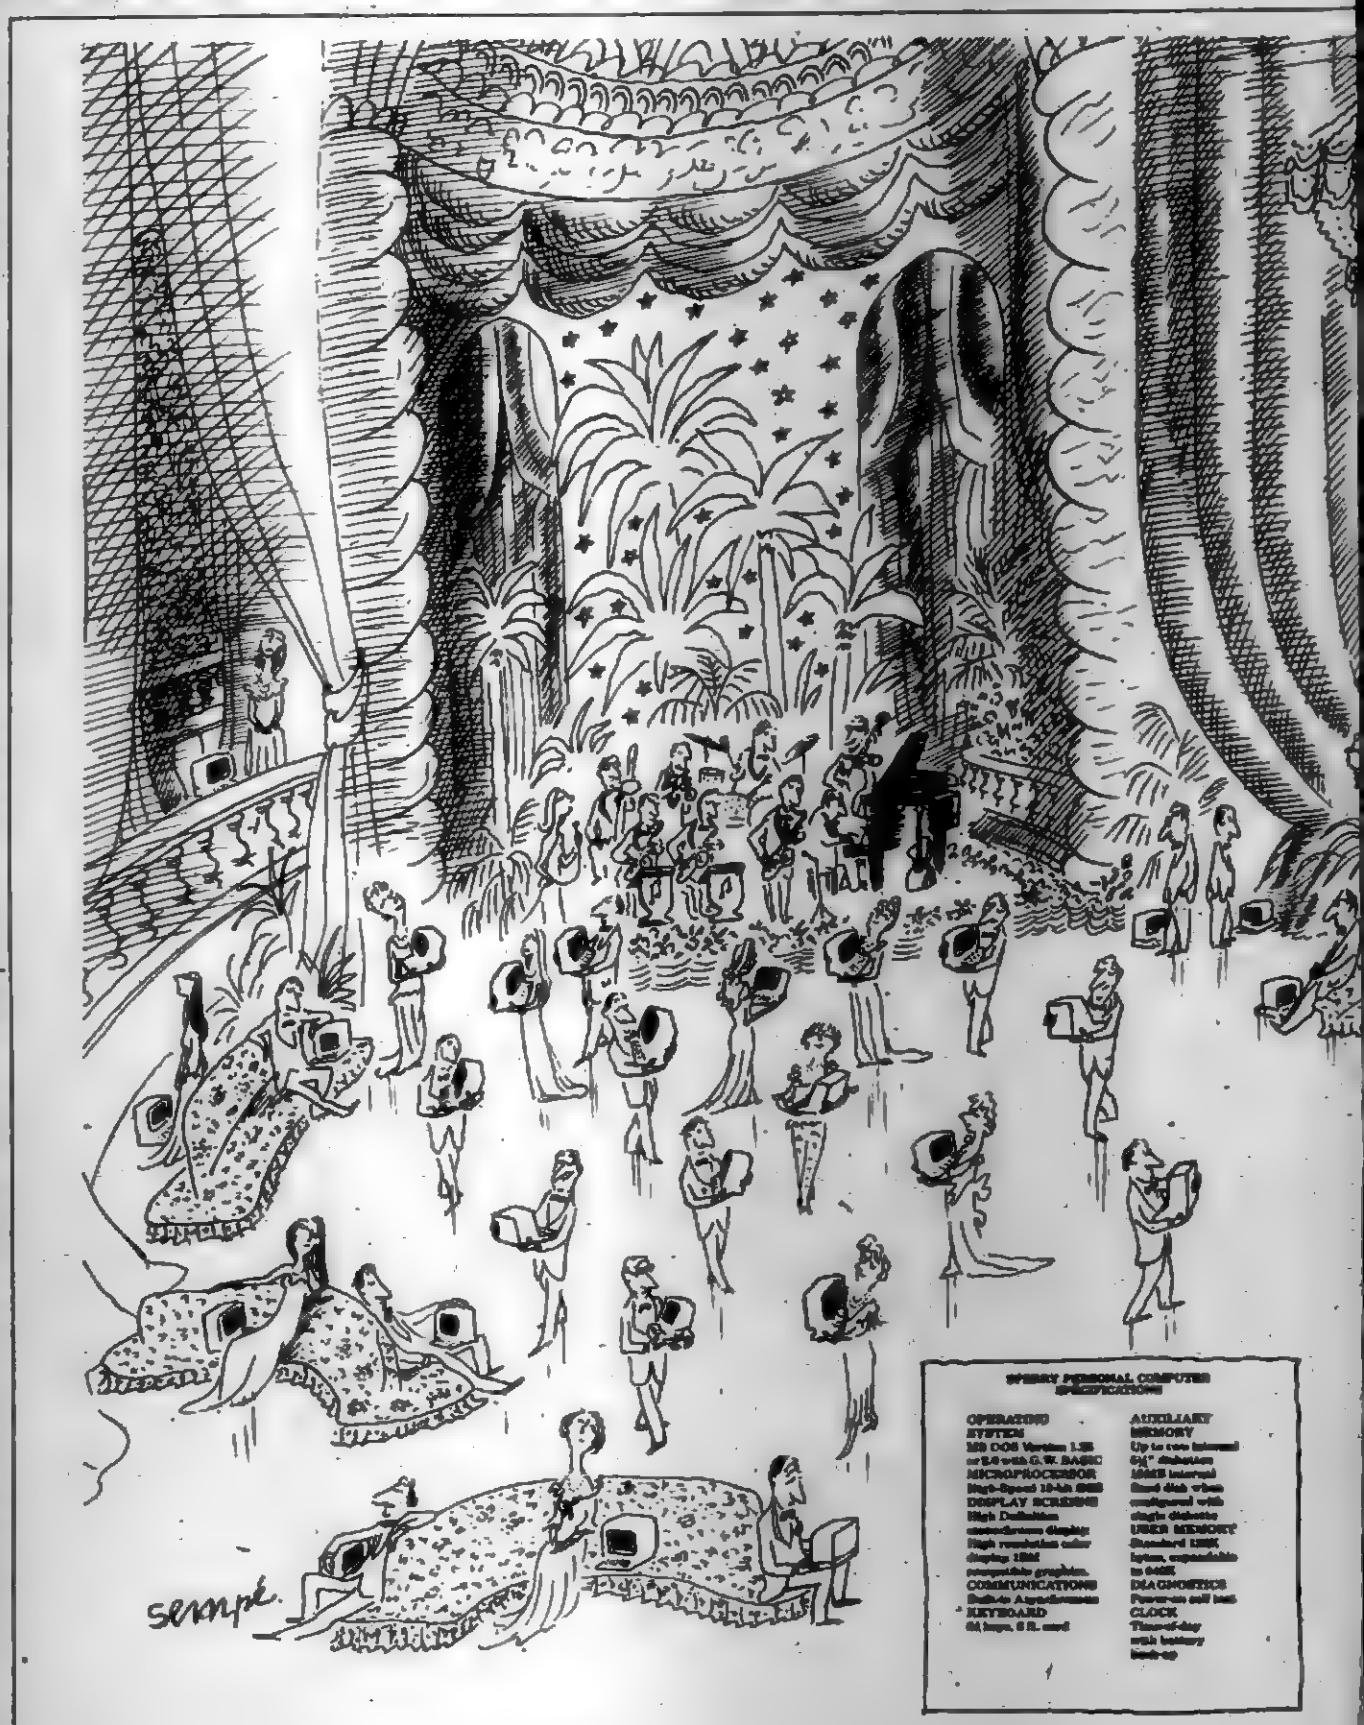
Gilbertson predicted that IBM's upcoming moves will include replacements for the 3080 and 4300 series processors, a new "fiber channel" for high-speed data delivery and a new emphasis on distributed processing, with the expected introduction of the token and star ring local-area networks.

In response, IBM compatibility will become an increasingly popular survival strategy. "We can have all the IEEE [Institute of Electrical and Electronics Engineers] and Ansi meetings we want, but IBM will continue to set the standards in the industry," Gilbertson said. "For example, when the token and star ring local-area networks are introduced, they will quickly obsolete all other offerings. In the micro area, competitors like [Apple Computer, Inc.] will have to become -IBM-compatible to withstand market pressures."

The private and government sectors will spend more than $1 trillion in the next five years for DP services — a vast sum, but one that Gilbertson said will purchase "huge capabilities." Processing power will become cheaper, as will additional memory capacity, although he predicted that cost savings for increased storage will level off as "designers reach the electromechanical limits of these devices."

More important, "telecommunications costs will drop even faster in the unregulated environment of the next decade," Gilbertson predicted. "It will become more and more economical to divide your processing resources, to move away from the idea of one central processing location."

But the "kicker" in all the good news, he said, is that programming costs will rise with the introduction of ever more new products requiring ever more sophisticated code. "It has been estimated that one line of Cobol code costs about $14. That cost won't fall. We're getting better at writing bug-free code, but we aren't getting any more efficient at producing code."



CALENDAR

WEEK OF JAN. 15

JANUARY 16-17, BOSTON — Data Communications for Personal Computers. Contact: Center for Advanced Professional Education, Suite 110, 1620 E. Garry St., Santa Ana, Calif. 92705.

JANUARY 16-17, DALLAS — Micro/Personal Computers: Comparative Analysis and Implementation Guidelines. Contact: Software Institute of America, 339 Salem St., Wakefield, Mass. 01880. Also being held Jan. 19-20 in Los Angeles.

JANUARY 16-17, SAN FRANCISCO — Managing Projects in the Structured Environments. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

JANUARY 16-17, DALLAS/RICHARDSON, TEXAS — Ithaca II. Contact: Center for Advanced Professional Education, Suite 110, 1620 E. Garry St., Santa Ana, Calif. 92705. Also being held Jan. 18-19 in Houston, Jan. 23-24 in San Francisco and Jan. 25-26 in San Jose, Calif.

JANUARY 16-18, ATLANTA — DP Auditing and Controls. Contact: MIS Training Institute, Inc., 4 Brewster Road, Framingham, Mass. 01701.

JANUARY 16-18, PHOENIX — Data Communications Systems. Contact: Center for Advanced Professional Education, Suite 110, 1620 E. Garry St., Santa Ana, Calif. 92705. Also being held Jan. 25-27 in Arlington, Va.

JANUARY 16-18, ATLANTA — Auditing Advanced Computer Systems. Contact: MIS Training Institute, Inc., 4 Brewster Road, Framingham, Mass. 01701.

JANUARY 16-18, RALEIGH/DURHAM, N.C. — Personal Computers and Networking. Contact: Center for Advanced Professional Education, Suite 110, 1620 E. Garry St., Santa Ana, Calif. 92705.

JANUARY 16-20, TRUMBULL, CONN. — Advanced Unix. Contact: Gregory Geiger, Bunker Ramo Information Systems, Trumbull Industrial Park, 35 Nutmeg Drive, Trumbull, Conn. 06609.

JANUARY 16-20, NEW YORK — Structured Analysis and System Specification Workshop. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held Jan. 16-20 in Chicago and Jan. 23-27 in Boston, Seattle and Columbus, Ohio.

JANUARY 16-20, BOSTON — Structured Analysis and Design Workshop. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held Jan. 16-20 in Minneapolis, New York and Salt Lake City and Jan. 23-27 in Denver and Pittsburgh.

JANUARY 16-20, COLLEGE PARK, MD. — Unix Workshop. Contact: Plum Hall, One Spruce Ave., Cardiff, N.J. 08232.

JANUARY 16-20, HOUSTON — Structured Analysis for Real-Time Systems. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held Jan. 23-27 in San Francisco.

JANUARY 16-20, WASHINGTON, D.C. — Unix and Software Tools. Contact: Mark Weber, Professional Exposition Management Co., Inc., Suite 205, 2400 E. Devon Ave., Des Plaines, Ill. 60018.

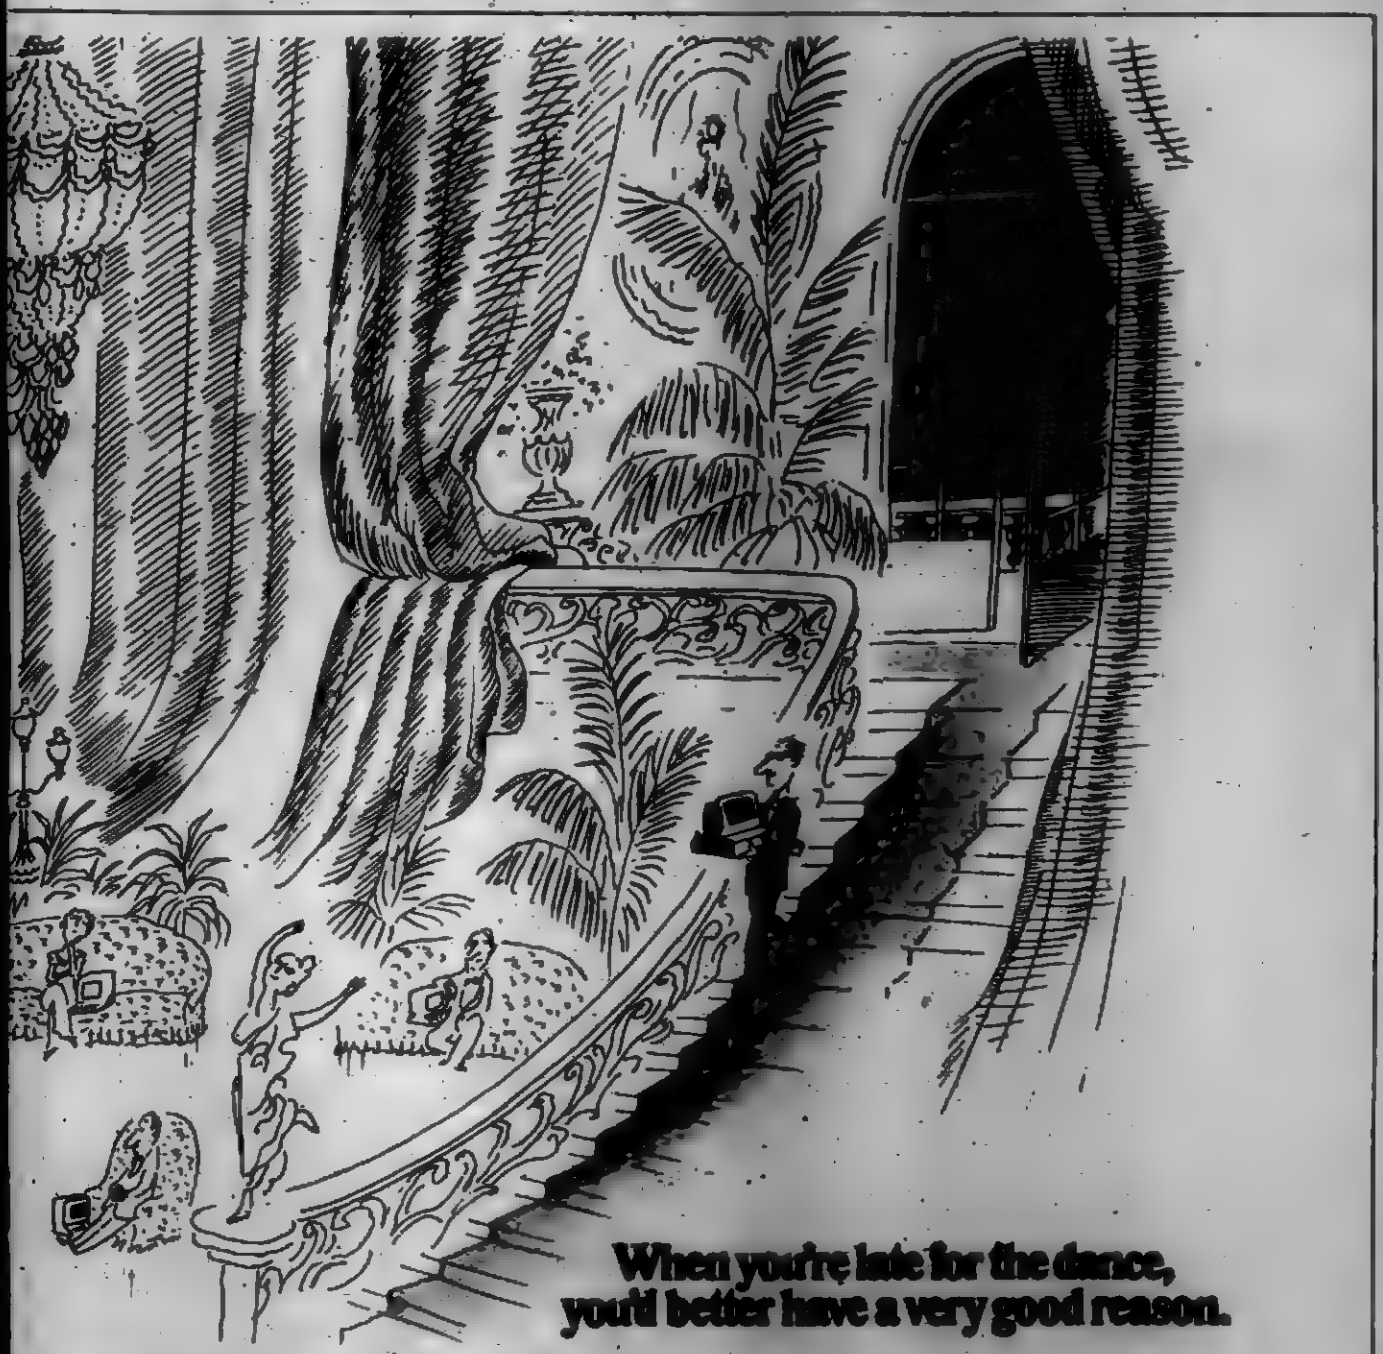
JANUARY 16-20, NEW YORK — Structured Programming Workshop. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

JANUARY 16-20, TRUMBULL, CONN. — C Programming. Contact: Gregory Geiger, Bunker Ramo Information Systems, Trumbull Industrial Park, 35 Nutmeg Drive, Trumbull, Conn. 06609.

JANUARY 16-20, BOSTON — Structured Design Workshop. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held Jan. 16-20 in Portland, Ore.

JANUARY 16-20, DENVER — Information Modeling Workshop. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held Jan. 16-20 in Denver, Raleigh, N.C., and Washington, D.C.

See DATES page 38



When you're late for the dance, you'd better have a very good reason.

The party started about three years ago for the personal computer.

And there was dancing.

But there wasn't much talking. Because as more and more computer companies arrived, there were some very real compatibility problems.

Until one latecomer arrived. Sperry.

With a remarkably simple solution. The Sperry PC.

It was able to run all IBM compatible software.

It was able to run all this software with stunningly more dramatic graphics and from a substantially more comfortable keyboard than IBM's.

And, with the flick of a special "turbo" switch, the Sperry PC could even run 50% faster than IBM.

Enough for one night? Not for the people from Sperry.

For the Sperry PC had the additional ability to plug into the real brains of an organization—the main computer. Whether that system was IBM or Sperry.

Or both.

The Sperry PC. An admittedly attractive arrival.

But when you get there late, you'd better have something important to bring to the party.

To see how the Sperry PC can work for you and for your free copy of the Micro Software Catalogue, write Sperry Corporation, Computer Systems, Dept. 100, P.O. Box 500, Blue Bell PA 19424. Or call 800-547-8992.

Professional Computer. personal computer And tomorrow.

For your best performance and productivity, rely on the TI Professional Computer.

Critics have called it "the machine IBM should have designed." And "the optimum personal computer." And thousands of demanding business and professional people have had similar praise for the design, software availability and dependability of the Texas Instruments Professional Computer. Here's why.

Best internal design.

With the TI Professional Computer, you avoid the possibility of computer underbuy or overbuy. Unlike IBM, our standard PC can grow to XT capability — so you don't have to choose between a PC or an XT. If you need more computer after you buy the standard TI Professional Computer, add features like internal memory up to 768K RAM. And internal 10 megabyte Winchester disk. Or other expansion capabilities which you can add using our 5 built-in option slots. So you get more computer without buying a new one.

Best graphics.

Our high resolution monitors give you some of the sharpest displays available, 3-plane graphics and the capability for 8 simultaneous colors or monochrome shades (IBM and Apple give you only 4). Plus, unlike IBM, the same software runs on either the color or monochrome monitor.

Best software available today.

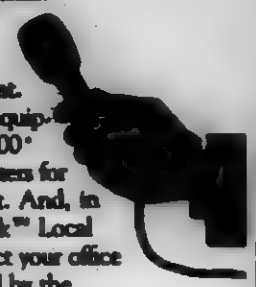
Literally hundreds of third-party software packages are available for the TI Professional Computer. Including the best-sellers like Lotus 1-2-3™. TI and leading third-party software suppliers are committed to developing new programs to help keep your business ahead.

Best keyboard.

Superior design makes this the easiest to use keyboard. You get 12 programmable function keys for faster, easier use. Separate numeric keypad and cursor controls. And isolated edit/delete keys to prevent accidental loss of data.

Best new features for the future.

Come in to a participating dealer today for a demonstration of the TI Professional Computer using our revolutionary speech recognition† capability. Soon you will be able to add the recently announced Speech Command™ option to the TI Professional Computer. This will enable you to operate the computer with simple voice commands. Which lets you work a lot faster and easier.



Best support equipment.

We offer companion equipment like the OMNI 800* Model 850 and 855 printers for reliable hard copy output. And, in early 1984, the EtherLink™ Local Area Network to connect your office workstations. All backed by the TI worldwide network of service and support.

See the TI Professional Computer for yourself. It is, quite simply, the best. Today and tomorrow. Now at participating ComputerLand stores and independent dealers. For the location nearest you, and answers to questions about your computing needs, call 1-800-527-3500.

EDITORIAL

And now, 1984

How perfect! We enter 1984, trying to shrug off George Orwell's dire warnings of government control and surveillance, only to find there is a proposal to expand drastically the Federal Bureau of Investigation's capability to monitor electronically noncriminals.

The proposal to expand the bureau's National Crime Information Center network to surveil "associates" of certain types of criminals is only in very preliminary discussion and may go no further.

But the trend is very disturbing. Last year the FBI and the Secret Service turned the NCIC, an interstate criminal records exchange system, into a national surveillance system by adding a file to monitor the activities of persons of interest to the Secret Service.

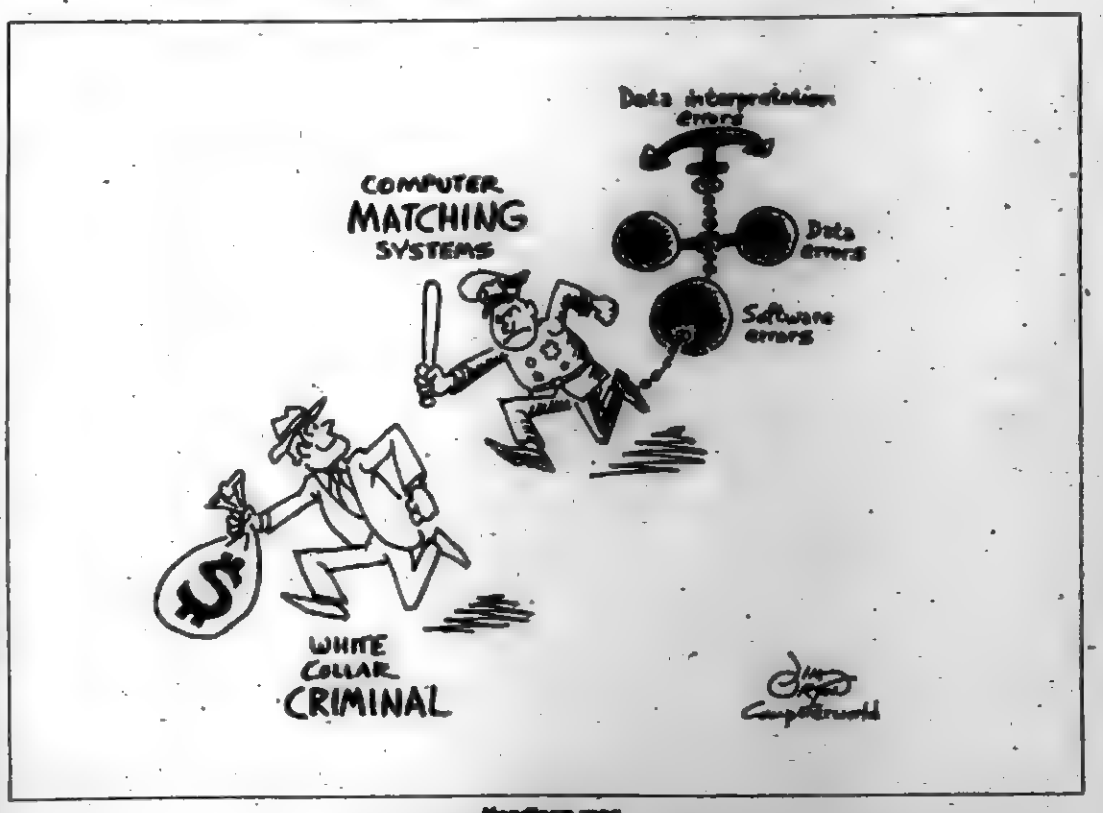
A congressional oversight subcommittee said the file was illegal, but the FBI claimed it was needed to protect the president. Now the FBI can claim it needs further surveillance capabilities to stop terrorists, drug runners and foreign spies.

Some, no doubt, will wonder why the FBI didn't have this capability before and why it should not have it now. Of course law enforcement should have the tools to stop terrorists and spies, but the NCIC should not be one of them. That system was designed to provide data to thousands of police officers and court officials across the country. These people surely are not the first line of defense against terrorists or spies.

More importantly, in some states the network is open to anyone and is used by many firms to see if job applicants have criminal records. What happens when your cousin, unknowingly in an NCIC "known associate" file because she baby-sits for a mobster's sister-in-law, goes looking for a job or is stopped for speeding? She might be denied a job or find a policeman, alerted to the NCIC "hit," pointing a gun at her.

That sounds far-fetched, but without some statutory guidelines, who knows what kind of information will go into this kind of file? And police system "computer errors" have resulted in the jailing and death of innocent people before.

It is frightening to consider what might happen if this sort of activity is allowed without specific legal authority. If the FBI can use records systems to monitor individuals, why can't other government agencies or even private corporations? In Orwell's novel, people were constantly monitored by the government. Now, it seems, in the real 1984 we might have many Big Brothers.



Handicap race

LETTERS TO THE EDITOR

Problems not common to all environments

In Barry L. Abramson's article, "Reducing Security Risks Associated With VM Access" [CW, Dec. 5], Abramson cites several security-related problems he has perceived in his organization's use of IBM's VM operating system and outlines the steps he has taken to address them. The article implies that these problems arise from operating system shortcomings and suggests that they might be corrected in future versions of VM.

Judging by the descriptions given, these problems are due mainly to the manner in which the operating system is used and are not common to all VM application environments. The solution techniques described employ standard tools provided to users by the operating system for that purpose and others and are not, strictly speaking, modifications to the operating system. (However, system source and change management tools are provided with VM to facilitate local operating system modifications, should they be needed to meet special installation requirements.)

It is difficult to see how the base VM system might be modified to alleviate problems such as those described without impairing or precluding many existing legitimate and productive uses of the operating system in differing environments.

Edsen C. Hendricks
Systems Consultant
San Diego, Calif.

Inaccurate picture

Barry L. Abramson's article, "Reducing Security Risks Associated with VM Access" [CW, Dec. 5], presents a profoundly inaccurate picture of VM/SP. Specifically:

- Userids are normally not shared. The problems Abramson claims to solve are caused by users' sharing what should be private resources.
- His scheme for naming files to indicate ownership and to implement control won't work and destroys the benefit of meaningful (user-chosen) file names.
- A number of products (commercial and public domain) are available for manually or automatically backing up data. Abramson seems to have discovered (for himself, the hard way) the benefits of regularly backing up data.
- The CMS command ERASE * * * (printed as ERASE "*") is invalid and is not allowed by CMS.
- The cornerstone of his scheme, CMS EXECs for file protection, is terribly unreliable; an architecture built on EXECs can be defeated by a slightly knowledgeable user.

The article makes two valid points, but offers no solutions. First, sharing files among CMS users is cumbersome (but not for the reasons listed). Abramson fails to mention that many file and library management packages exist that provide controlled and auditable access to files across virtual machine boundaries.

Second, he says that "the responsibility for ensuring system and file security rests with the managers and users of these facilities." But it requires a better understanding of the facilities and weaknesses of the system than he demonstrates.

Computerworld is a member of the CW Communications/inc. group, the world's largest publisher of computer-related information. The group publishes 42 computer publications in 16 major countries. Nine million people read one or more of the group's publications each month. Members of the group include: Argentina's Computerworld/Argentina, Australia's Australian Computerworld and Micro Computer News; Brazil's Computerworld and Mundo Unix; Chile's Chile Computerworld; Denmark's Computerworld Danmark and AlleyData; France's Le Monde Informatique; Germany's Computerwoche, Mikrocomputerwelt and PC Welt; Italy's Computerworld Italia; Japan's Computerworld Japan; Mexico's Computerworld Mexico; Norway's Computerworld Norge and AlleyData; Saudi Arabia's Saudi Computerworld; Spain's Computerworld/Espana and Microbusiness; Sweden's Computerworld Sverige, AlleyData and Att Hantera; the UK's Computer Management and Computer Business Europe; the U.S.' Computerworld, Desktop Computing, Hot CoCo, InCider, InfoWorld, Micro Marketworld, Microcomputing, PC World and Software.

VIEWPOINT

U.S. computer industry: 1984

LECHT ON SCIENCE

CHARLES LECHT

In 1984, fantastic changes, some started in 1983, others earlier, will deepen in their effect on our computer industry and cause its evolution to the information services industry to be accelerated. This will occur if for no other reason than 1984's sudden entrance in our industry of a sea of communications companies to compete for marketplace share. The fact that one, AT&T, has the right stuff to capture a lot of it should give our computer industry added incentive for rapid change.

The computer industry events of 1984 will be as diverse as they are exciting. I offer the following in the realms of supercomputers, large mainframes, mid-range computer systems, minicomputers, microcomputers, terminals, telephones and services as representative.

Astonishingly, America's supercomputer industry will complete its withdrawal from our view. Control Data Corp.'s spin-off of Electronic Technology Associates, Sperry Corp.'s strange repudiation of Univac's name, IBM's decision to drop Josephson technologies and then to aid in the formation of Hypres as well as other signals emanating from Cray Research Corp. and from our newly formed Microelectronics Computer Co. all tell us that the really high-powered stuff is headed for silent and unseen development.

Large mainframe business

The large mainframe business will continue to exhibit youthful vitality as companies that need heavy firepower are given increased incentives, including massive discounts, to acquire more and more of it. Price performance improvements will occur so rapidly that we will be confounded in assessing the residual values of things purchased. And each incremental improvement will be substantial enough to warrant our serious consideration of its adoption.

> *Programming as we know it today will truly start to disappear in 1984. With increased usage of ISDN facilities a certainty, increased investment in their software offerings will occur. These will relieve us from the need to learn artificial lingos like Cobol to get a computer to do our bidding.*

The mid-range computer industry as we know it will begin to vanish. Despite vigorous economic growth, these systems will see their usefulness diminish as stand-alone corporate facilities begin to be replaced by terminals linked to mainframes and/or to our emerging integrated services digital networks (ISDN). The advantages of centralized data processing will be rediscovered, as distributed systems facilities are easily obtainable through ISDN ports.

Our old minicomputer industry will merge with our new microcomputer industry; both will join the smart terminal industry, which will ultimately include the telephone industry. Then all of them — micros, minis, smart terminals and telephones — will slowly begin to metamorphosize into the dumbest terminals possible: idiot-proof boxes requiring as little thinking as we can get away with to perform our most sophisticated chores.

The labeling of terminals as dumb or smart will cease. We will discover that few intelligent people really want to program computers to do things that can be obtained without programming (all other things being equal).

Thus, we can expect our fast-rising sea of programmable devices to be soon engulfed in a swelling ocean of nonprogrammable analogs whose appearance will drastically diminish our need to program anything.

Programming as we know it today will truly start to disappear in 1984. With increased usage of ISDN facilities a certainty, increased investment in their software offerings will occur. These will relieve us from the need to learn artificial lingos like Cobol to get a computer to do our bidding.

Natural-language front ends that place plain old English at our disposal are imminent. No, not the high-class literary stuff (which you're used to reading in my essays, of course), but rather the utterances of businessmen everywhere fumbling and mumbling through their chores and acting in decidedly human and discombobulated ways. Composed of monosyllabic phrase-like grunts whose issuances have a high probability of representing little more than frustration, plain old English is the evolved lingo of jawing businessmen everywhere and even in its inherent inefficiency and ambiguity is preferable to any synthetic language we may devise.

The need to program will also be diminished by yet increased usage of canned applications — especially when we are able to command these to do our bidding with natural-language utterances.

AT&T will increasingly enhance the services it offers while deploying a blizzard of devices to aid users in obtaining them, from telephones to portable personal computers to workstations to on-site corporate computer facilities. At the same time, it will modernize its communications facilities, install cellular mobile systems and announce alternatives to users currently faced with land-based "last-mile" interconnect problems.

IBM will make love, not war, with AT&T. All the *Star Wars* theories will be disproven in 1984. AT&T is IBM's largest customer; in turn, IBM's dependence on AT&T's communications facilities will increase inordinately in the year to come. AT&T, which is buying IBM 3084s as fast as it can, cannot carry off its plans without IBM products. Projected volume and delivery schedules could not be met even if the rest of the computer industry dedicated all its available production to the new AT&T, not to speak of its 22 offspring.

IBM will come out of the closet to become a highly visible telecommunications company offering every conceivable service by year's end. Starting as a reseller of AT&T communications facilities by offering a potpourri of enhancements (the company already uses AT&T lines to deliver its Information Network offerings) and moving on to eventual utilization of Satellite Business Systems facilities, IBM has set its course to become a major force in the telecommunications field.

The American computer and telecommunications industries, through their trade associations, will apply pressure upon our government in order to seek aid in thwarting foreign competition.

Japanese singled out

The Japanese will be singled out, since American electronics companies believe that European competitors are more a threat to themselves than to anyone else. The Communications and Computer Industries Association and its once arch rival, the Computer and Business Equipment Manufacturers Association, will join with the Electronics Industry Association to pool their resources in lobbying the corridors of Capitol Hill to prevent the sale of Japanese electronics in the U.S.

Those biased and self-interested groups will unwittingly mount a campaign that can only result in higher

See INDUSTRY page 42

Some of my best friends are users

HUMAN CONNECTION

JACK STONE

Although it may sometimes appear otherwise, I have no ingrained prejudice against the user community. If the truth be known, some of my best friends are users.

What has happened, though, is that the expectations of many of the new user set — based on a little knowledge of personal computer operations, enough to be dangerous — have transcended into the systems netherlands, a realm of automation make-believe that resides only in the imagination of unknowing users. Even worse, from such fantasies this ilk has derived ridiculous conclusions about the viability of the computer center organization, in certain cases passing such views on to top executives as gospel. I'll wager a pretty penny that if you wander unannounced into a user's personal computer complex, you'll catch some conversational gems along this drift:

■ "Why don't we give each department manager a personal computer to control his unit's operating records and data files? By doing so, we can eliminate a great deal of the hardware in the computer center that, as far as we can see, is doing little more than creating jobs for that department."

■ "Personal computers are more powerful, have great flexibility and are cheaper than the systems provided by the data processing organization. We should dismember the DP dinosaur and transfer the analysts into user groups where they can get a taste of the real world."

■ "Our central programming staff has been automated out of existence by the generalized file managers installed on our personal computers. No longer do we have to wait in line two years to get the programmers to make some system changes. Now we can reformat our files ourselves and in a matter of a few minutes. Programmers are a dying breed."

Hands-on demonstration

My reflection upon these people is simply expressed in the paraphrase of a biblical thought: The data processing community should forgive them, because they know not of what they do. The thrill accompanying a few elementary computer successes — finding the on/off switch of a personal computer, running a sort task and watching personalized letters pour out on a printer — leads the personal computer user to believe he is a genuine DPer. In fact, relative to the technical challenges in the large-scale computer center the personal computer experience is little more than that of a hands-on demonstration.

What can be done to deflate the wild notions that these novices have about central computer services without losing their trust and confidence altogether? One idea is to let the users proceed on their own, allowing them to learn from their own failures that personal computers, in spite of all their remarkable assets, are, nonetheless, tiny machines.

Of course, they have a role to play, but more and more of the new users are finding that to meet the demands for processing truly large files — and I'm talking in terms of the 500M-byte variety, way in excess of the 10M-byte hard disk capacity that many neophytes believe is the storage penultimate — or for high-speed number crunching, this role is one of a low-cost intelligent terminal interconnected to mainframes. And I'll guess that a good many users who make this discovery quietly phase their personal computers into the closet and negotiate for a decent terminal, determined not to disclose their embarrassment and/or stupidity.

VIEWPOINT

Don't talk down to your users

READER'S PLATFORM

DENNIS LA HOOD

How many times have you felt unappreciated for the extensive time and effort you've put into a project? If you hear anything from your user, it usually revolves around some problem. Almost never do you receive a thank you. How come?

As computer people, we become quite proficient in the skills of our technology. We tend to be creative and have high initiative and above-average intelligence. We demand a lot from ourselves, and our standards are usually pretty high. It is this kind of everyday elitism that also gives us a false sense of our importance. Our true mission is not to be the creators of all good, but to be the facilitators of our users' needs. It is the users' specific needs that result in the requirement for systems to be developed and for our existence. Without the need to build a system, there is no need for the architect. We sometimes lose sight of this. Consider the following:

■ Our first challenge is that of becoming good listeners. The next time you attend a meeting with your users, keep track of the following: How many times do we interrupt the user before they've completed a thought? How many times do we stop listening and start mentally developing a solution? How quickly do we start leading the conversation instead of acting as facilitators?

When we develop systems to our own understanding of the problem, we run the risk that the solution does not meet the user's expectations. Not meeting user expectations guarantees dissatisfaction.

■ Talk up to users, not down to them. It tends to be a normal inclination for DPers to think of themselves as smarter than most users. The fact is that the user is our boss, and even when we truly are smarter than our boss, we would never flaunt it. In most cases (if not all), the user knows more about the needs of the organization, and it is these needs that we must understand to attain the successful solution.

The user's knowledge, therefore, is most important to our success. In any learning environment, those that have the knowledge are treated respectfully by those who need to attain that knowledge.

■ Don't promise more than can be delivered.

What's your reaction to an advertisement that suggests a product is a panacea? How do you feel about a salesman's claim that "it'll be totally transparent?" When building user expectations, be careful to limit yourself to deliverables. If each deliverable is an expectation met, then user satisfaction will grow, and mutual respect will be enhanced.

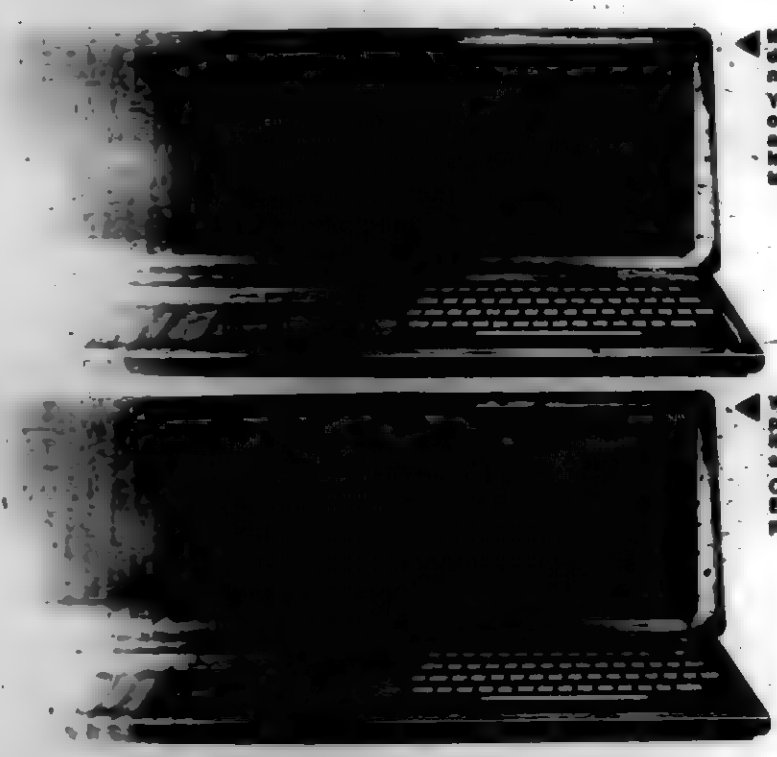
These three basic "to do's," when practiced diligently, will earn the systems development professional the recognition and job satisfaction that the extensive time and effort put into each project deserve. Give them a try.

Measure your recognition before and after. You can always go back to the old ways. But wouldn't it be nice to hear "nice job" just once? ‡

LaHood is director of computer and communications services at Agway, Inc. in Syracuse, N.Y.

THE ENCRYPTOR™

Data Security at An Affordable Price



If your microcomputer data looks like this, it's not secure.

Your confidential reports, client or customer files, and other critical business information can be tampered with or stolen.

With THE ENCRYPTOR™ products, your data looks like this — and it's totally secure.

Only individuals with Encryptor keywords can process your data.

Please send me information about The Encryptor™ products. I'm particularly interested in:

- ☐ Stand-alone micro application
- ☐ Micro-to-micro application
- ☐ Micro-to-mainframe application
- ☐ Total system application

By physically transforming data, THE ENCRYPTOR™ products provide complete protection for stored or transmitted information. They eliminate unauthorized access, manipulation, or theft of such confidential information as:

- Corporate trade secrets
- Customer or client files
- Electronic fund transfers
- Personnel records

THE ENCRYPTOR™ products are reliable, high-speed devices that can be applied to micro-to-mainframe, micro-to-micro, and stand-alone micro configurations. They comply with the national Data Encryption Standard (DES) and allow for implementation of Message Authentication Code (MAC) for electronic fund transfers.

THE ENCRYPTOR™ products offer the easy-to-use, cost effective solution to your data security problems. For more information, return the coupon or call Futurex Security Systems™ at 800-251-5112 (800-251-5111 inside California).

user costs, slower technological growth and a lot of hard feelings. I say "unwittingly" because most of their membership has more to fear from a handful of domestic competitors than from Japanese imports.

When not fighting the Japanese, these same groups will work over the Association of Data Processing Services Organizations, Inc. (Adapso), whose leading members are ill prepared to cope. Squeezed between the competition of emerging value-added ISDN facilities and newly emergent data processing service organizations offering banking services from within banks, brokerage services from within brokerage firms and the like, Adapso membership will find 1984 tough sledding.

It's hard to imagine that a Martian landing is high on the list of New Year's resolutions of anyone I know, although conditions for a landing are improved by the close proximity of Mars to Earth in May 1984. So I won't predict the surprise announcement of an Earth-Mars landing party. But it wouldn't be so farfetched if it did occur. What about *Sputnik*'s surprise launch in 1957. Whatever, 1984 will be remembered for the high-tech surprises it will bring and, on balance, I forecast that we'll all be better off because of these. Hang on; Happy New Year.

SOFTWARE & SERVICES

Micro link options growing

By Betty Prosser
Special to CW

The personal computer's ability to access information on large mainframes has spawned major developments. In just two years, hardware and software companies have spent millions on micro-to-mainframe development. The confusion surrounding this intensive period of development is now giving way to a market that provides a real choice.

When examining today's micro-mainframe products, you need to consider three major factors: function — what the micro-mainframe product is designed to do; integration; and transfer capability — how the mainframe information is transferred.

Most products provide a method of downloading mainframe information to a personal computer, where micro software packages such as spreadsheets, word processors or graphics systems provide management analysis and reporting.

Integration is also a popular concept of this new transfer technology. A fully integrated micro-mainframe software system provides automatic loading of mainframe data directly into the personal computer's application software. The highest level of integration provides an added degree of flexibility by automatically loading mainframe data into multiple personal computer applications.

Few micro-mainframe products have achieved this level of integration. Most only build a separate file on the personal computer's floppy disk. After the mainframe information is transferred to this special "transfer file," an additional step is required to load the data into an application on the personal computer. True integration allows the user to specify which personal computer application will use the mainframe data. Then, when information transfer is initiated, it is automatically loaded into the personal computer application.

See MICRO page 44

UFO/Cobol unveiled for CICS, CMS

HASBROUCK HEIGHTS, N.J. — Oxford Software Corp. has announced UFO/Cobol, an Ansi Cobol-based IBM CICS and CMS application development system.

The product is based on a language consisting of Ansi Cobol statements with natural extensions to run in an on-line environment, a spokesman said.

A pseudoconversational mode of executing on-line programs is provided along with support of all CICS and CMS I/O facilities using standard Ansi Cobol extensions. The product supports calls to standard data base interfaces as well as call subroutines in other languages that conform to CICS or CMS requirements, the spokesman said. An interactive screen painting facility eliminates the need to separately assemble Basic Mapping Support maps. All IBM 3270 screens are treated as ordinary records in a Cobol program. Support of 3270 attributes includes color, highlighting, protection and testing for modified fields.

The Paint facility allows for the free-form design of 3270 screens on-line without code writing. Use of screens is defined, and all CICS or CMS code required to perform on-line transactions is eliminated and replaced with natural Cobol language extensions, the spokesman said. Program execution allows for the pseudoconversational execution of all programs with no preprocessing involved in program compilation.

The CICS/VS version is available immediately. The VM/CMS version will be available in the second quarter of 1984. The price is $24,000 for the IBM DOS version and $33,000 for the OS version. A 25% discount is available through April 1, the vendor said.

Oxford Software, 174 Blvd., Hasbrouck Heights, N.J. 07604.

DBMS for micros called lacking

SOFTALK

PAUL GILLIN

Think about that nice new data base management system (DBMS) you just bought for your microcomputer. Do you really need it? Is it really better than the alternatives? Do you think you will be using it in two or three years?

Jon Nackerud thinks not. The founder and former president of Relational Technology, Inc., which markets Ingres, a relational DBMS, has been keeping a close eye on the micro DBMS market since the products began to proliferate last year.

He is decidedly unimpressed. "Nothing on the market interests me at the time," he said in a recent interview. "It's like a gold rush. Everybody's sold their farm and got their wagon and headed west. They're digging a lot and finding a lot of fool's gold."

Just as spreadsheets were the hot item of the early part of 1983, micro DBMS flourished at the end of the year. Driven in large part by the success of Ashton-Tate's Dbase II (which is now shipping more than 1,000 copies a month) the new entries have sought to capitalize on some of the obvious weaknesses of Dbase, particularly in the areas of ease of use. All but a handful claim a relational structure.

Nackerud called Dbase II "an excellent DBMS," but added that it has spawned a host of imitators and a market direction that is far off course. Micro DBMS vendors are attempting to sell a product without an application, he said. The frenetic quality of the micro software market typically results in a flurry of announcements on the heels of each successful new product, he said. Unfortunately, foresight gets lost in the chaos while market share becomes a vendor's critical considera-

DUQUESNE SYSTEMS

DUQUESNE SYSTEMS
Shared Device Management products provide a comprehensive solution to the problem caused by sharing data and devices between two or more computer systems. If you have a multiple CPU environment, then you need one or more of our Shared Device Management products. SDM provides global control over DASD, tapes and console devices with many benefits such as data integrity, elimination of operator errors and elimination of redundant hardware.

SDSI

Shared Dataset Integrity, SDSI, solves the inherent data integrity problems caused by the simultaneous access of the same data by more than one system without the use of device 'reserves'. SDSI greatly improves system performance by allowing the user to eliminate device 'reserves' from existing programs without any system or program modifications.

STAM

Shared Tape Allocation Manager, STAM, automatically manages mountable devices, (tape and disk), in multi-CPU installations. Allocation decisions for shared device pools are made automatically, thus eliminating the potential for disastrous operator errors and more effectively using those valuable resources than is possible with manual control.

SCON

Supervisole is designed to provide a single console image for a multi system environment where console messages can be merged together to create a single stream on one or more designated consoles. The result is a more streamline and productive operating environment. Operators will have to monitor only one console instead of many eliminating the need for redundant hardware and personnel.

Ingres Update Offered

Relational Technology, Inc. has announced Version 1.2 of its Ingres relational data base management system for Digital Equipment Corp. VAX-11 computers under DEC's VMS operating system.

The new version is said to feature improved transaction processing capabilities, better concurrency control, provisions for textual data and enhancements to Ingres/Forms, the company's forms management system.

In complex transactions, "begin/end" commands can be bracketed around any set of updates to preserve the consistency of the data base when records spanning several files are updated as single-user transactions, a spokesman said.

Multiuser concurrency control is improved with page-level locking, and the software will automatically escalate locking to relation level when it is more efficient, the spokesman said. Ingres will also detect deadlocks when they occur and abort one or more transactions in progress.

Ingres/Forms users can create forms with "table fields" that let users view and update several records from a file simultaneously.

Ingres is priced at $40,000 for a VAX 11/750 or 11/780 and $20,000 for a VAX 11/730.

Relational Technology, 2855 Telegraph Ave., Berkeley, Calif. 94705.

UNIVERSITY OF MINNESOTA SCHOOL OF MANAGEMENT PRESENTS SEMINARS FOR THE SYSTEMS ANALYST

April 16-20, 1984
Radisson Inn & Yacht Club
Superior, Wisconsin

Sponsored by:
MIS Research Center and Executive Development Center

"Seminars for the Systems Analyst" is a chance for companies to develop their talent from within and a chance for professional systems analysts to refresh their skills. These comprehensive seminars take a two-phase approach to systems analysis training.

PHASE A (three days) Systems Analysis and Design

PHASE B (two days) Interpersonal Skills for the Systems Analyst

For Further Information contact:
Gayle Wooten
Executive Development Center
324 Management & Economics Bldg.
271 - 19th Ave. So.
Minneapolis, MN 55455
612/373-3837

NOTE:
Training at your site. . . we can bring this seminar to your site at a significantly lower cost. For further information contact

Options from page 43

Another element that differentiates the various micro-mainframe offerings is the method of transfer. This determines the amount of mainframe information sent to the personal computer and directly affects how selective the user can be in choosing information to download.

During the early phases of micro-mainframe development, the on-line screen was the standard unit of transfer. The only flexibility in selection was the option to transfer partial contents of an on-line screen, such as columns of budget figures. Despite its limitations, this screen-by-screen transfer has certain advantages. Because the transfer operates independently of the mainframe software, the mainframe system requires no modifications.

However, screen-by-screen transfers are somewhat limited for applications requiring transfer of greater volumes of data. Large-scale financial analysis requires many transfers to assemble a comprehensive report. Nevertheless, screen-by-screen transfer is excellent for bottom-line analysis.

The latest developments in transfer technology offer new solutions to this problem. One approach is file-to-file transfer, which involves selecting part or all of a mainframe file and then transferring the file to the personal computer.

While this is an effective way to download entire files, it also has certain limitations. File-to-file transfer usually requires a special batch job to create the transfer file. As a result, it requires the involvement of DP personnel as well as a time commitment.

If the system is not fully integrated, this method will require an additional selection process and a separate function to load the information manually into the personal computer's application software. File-to-file transfer may also quickly fill up disk space, since large quantities of unwanted data are transferred.

The alternative is a new concept called data base sharing. With data base sharing, each on-line mainframe system is divided and then subdivided into manageable units of information which are actually mini data bases.

DP personnel are not required, and data base sharing is not restricted by file boundaries. Instead, data elements are grouped in logical units that are easily selected and transferred in an on-line environment. Multiple mainframe files may even be accessed and transferred in one request.

Assume, for example, that a manager wants to use the accounts payable system to analyze figures for one regional office. Part of the information resides on a vendor master file, and part of it resides on an invoice file. Both files are so large that a file-to-file transfer to a personal computer is not feasible. Using data base sharing, the manager may select only the vendors and invoices for the particular regional office and then transfer only the selected material directly to the personal computer. If this data base sharing facility is completely integrated, the invoice amounts can be automatically loaded into a spreadsheet micro application at the time of transfer.

The future will bring even more accelerated development in micro-mainframe technology. As major hardware vendors such as IBM provide more sophisticated equipment and mainframe software vendors negotiate agreements with micro vendors, the product offerings are sure to become even more confusing. Future development will center around the data base sharing concept.

Fessor is product manager of Management Science America, Inc.'s Personal Computer Products Division.

DBMS from page 43

tion. "There's not a lot of thought about whether products have a long life," he said.

The root of the problem goes right down to the personal computer user, who is generally ignorant of data processing concepts and couldn't care less about the mechanics of a DBMS, he said.

"A lot of people are buying personal computers out of anxiety. They don't want to be left behind," he said. "I find most of their needs can be filled by using 3- by 5-[in.] cards."

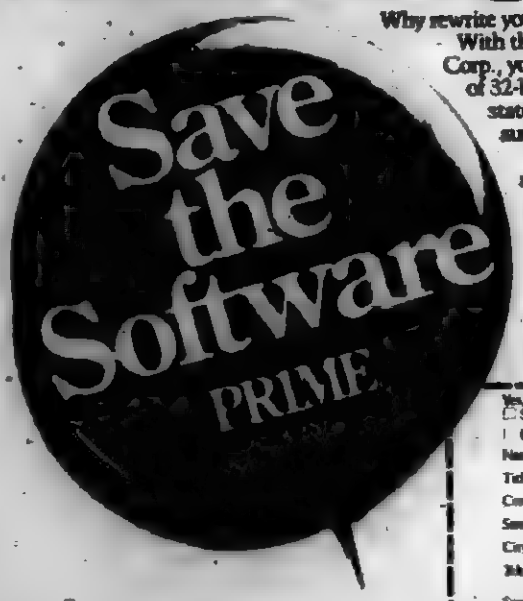
Such users are now bombarded by ads full of DBMS bells and whistles, but offering few ideas of how to use the newly functional data, he said. "Companies are coming out with a $2 million advertising commitment which basically says 'you the consumer are too dumb to know the difference,' " he said. Again, users are buying the DBMS for fear of being left behind.

Nackerud, who left Relational Technology last August, said he is far more impressed by application-specific products that have emerged on the micro. And therein lies the future of micro DBMS. Visicorp's Visicalc and Lotus Development Corp.'s Lotus 1-2-3 are "very good ways to present data," he said.

Nackerud predicts that micro DBMS in their current forms will cease to exist within three years. Instead, the data base will be incorporated into the application with ties to more elegant DBMS on the mainframe.

The market is still open for someone to declare a micro data base standard, one which can be accessed by all applications, he asserted. Distributed data bases will emerge with simple features at the micro level. More sophisticated functions such as backup and recovery, journalization and page locking will be added incrementally at various levels up to the mainframe.

Move up from your System/34 without losing your investment.



Why rewrite your software just because you've outgrown your System/34? With the ESCAPE/34 software package developed by Database Systems Corp., you can migrate all your System/34 applications to the Prime 50 Series of 32-bit computers. ESCAPE/34 makes up to 95% of your RPG II statements compatible with Prime. Any remaining statements are automatically flagged for you.

Then once you're in the Prime family, you'll never have to worry about growth again. All our computers are fully compatible, clear up to a system with 16Mb of memory and 5 billion bytes of storage. And you can keep growing, with the most versatile networking in the industry, fully integrated office automation software, extensive CAD/CAM capability, and over 1,000 third-party applications.

Send the coupon today for more information, or call our toll-free number. And help us save your software investment.

Only Lee Data's Universal Terminal System can satisfy all of your information processing needs... 3270, Async and personal computing.

Finally, there's a single, universal way to satisfy the individual information processing needs of all your people. From sales manager to accountant. From research to production. The Lee Data Universal Terminal System can do it all.

And our system is modular by design to provide you any or all of these cost-effective, problem-solving advantages:

3270-compatibility plus more

Combine complete 3270 system-compatibility with an innovative Lee Data design and you have a System that delivers greater convenience and flexibility.

Our System not only offers standard 3274-compatible local and remote control units, but now also provides combination local/remote controllers with a unique dual-host access capability.

In addition, you can choose from a full line of terminal capabilities, beginning with our cost-effective 3178-compatible display on up to our popular All-In-One Display which offers, in a single unit, four selectable screen sizes—including 132-column—a great advantage in program development, spread sheet applications and many others where flexibility is required.

3270-plus-Async: another cost-effective advantage

If your application needs currently find you switching between 3270 and VT100-style terminals to get the job done, Lee Data has a better way.

As part of our System, you can enjoy the further advantage of a 3270/Async capability that allows dynamic selection of 3270 and VT100 operating modes from a single Lee Data display. A simple command entered at the keyboard provides you access to applications running on an IBM CPU, non-IBM systems (such as DEC, H-P or Prime), as well as timesharing services. Another Lee Data solution to simplifying your company's terminal network.

And now integrated personal computing too

That's right! Now our System also includes a sophisticated personal computing package that can easily be integrated into an existing Lee Data 3270 system.

With our approach, you get continued interactive access to host-based files, plus all the advantages of professional business computing from the same Lee Data workstation.

Advanced features include a host file transfer capability, a single-board design, four standard system expansion slots and, of course, complete IBM-compatibility.

All these additional capabilities plus the same user-friendly Lee Data displays.

Plus these added benefits...

To any Lee Data System, add our unique Coax Eliminator products and realize additional savings of up to 85% in cabling costs alone.

Combine this with all the outstanding features already mentioned and you'll find a System offering everything you need for efficient, cost-effective operation.

Discover the advantages of our Universal Terminal System for yourself. For more information, call our system specialists toll free:

ADVANCED SYSTEMS CONCEPTS, INC.
Performance Simulation System

Advanced Systems Concepts, Inc. has announced a performance simulation package for the Digital Equipment Corp. VAX-11 series of superminicomputers.

The Performance Simulation System reportedly allows a user to record one or more terminal sessions for the purpose of replaying them under a variety of scenarios.

A company spokesman said the package provides three main facilities: performance testing, application reliability and security.

The package is said to provide a transparent method of capturing one or more terminal I/O sessions. The spokesman said the input log may be edited as required and then replayed through "pseudo" terminals, allowing large terminal and/or transaction loads to be performed while not consuming significant manpower and terminal resources. During playback, the output of the simulated terminal session is captured, enabling comparison of the original output log against the playback output log, according to the spokesman.

The package is immediately available for license fees of $4,995 for the VAX-11/780, $3,495 for the VAX-11/750 and $1,995 for the VAX-11/730.

Advanced Systems Concepts, 22 Hudson Place, Hoboken, N.J. 07030.

SIGNAL TECHNOLOGY, INC.
Quickstar

Signal Technology, Inc. has introduced a set of utility programs for Digital Equipment Corp.'s VAX-11 computer.

Called Quickstar, the set consists of three interrelated programs. The first component, Quickstat, is used for interactive system status monitoring. It reportedly gives managers information on what system resources are being used, and it provides additional selective privileges, the company noted.

Quicktalk, another component of the program set, enables users to communicate between terminals. A user can send a message to any other user or connected terminal with a single command.

Quickchange was reportedly designed to allow users to change from one user name to another without logout and logon steps while retaining recording of accounting messages, changes of defaults and checking of privileges.

Quickstar is priced at $1,700.

Signal Technology, 5951 Encina Road, Goleta, Calif. 93117.

STARTECH SOFTWARE SYSTEMS, INC.
PC/Viewcom

Startech Software Systems, Inc. has announced the PC/Viewcom system, a micro-to-mainframe link that provides for the off-loading of host printing and automatic report distribution.

According to Startech, the system utilizes IBM's CICS teleprocessing monitor and the IBM Personal Computer to route batch reports or online transaction-generated reports to the Personal Computer printer or IBM 3280 or 3260 series printers. It is said to provide full-function mainframe-type spooling facilities such as forward and back spacing printers in the event of a forms jam, report class type queuing, report purging and user report directory displays.

The system reportedly can drive up to three printers simultaneously per Personal Computer, and each device can print different reports from the host.

PC/Viewcom is priced at $2,000.

Startech Software Systems, 3539 Borough Place, Woodside, N.Y. 11377.

BUSINESS SYSTEMS ASSOCIATES
Laserset

Business Systems Associates (BSA) has announced a product that is said to allow users of Hewlett-Packard Co.'s HP 3000 to utilize Xerox Corp.'s Xerox 2700 laser

We Make the Addition Easy Anywhere in the World. PHAZE

In a time when the highly competitive information marketplace is expanding from a national to a global scale, today's corporations must decide how they will position themselves in this changing market. As a company that provides solutions to the problems that face modern business, PHAZE has taken its position in the world market with a commitment to excellence—not only in our products and people, but to our ideals of quality, service and value as well.

SOFTWARE & SERVICES

printer.

BSA's Lasersoft software utility package, combined with an interface controller and the Xerox 2700, enables HP-3000 users to operate the laser printer to merge forms and data from existing reports, a company spokesman said.

The package features Printform, enabling the operator to copy the contents of any form on the laser printer, including data and display enhancements.

A package including Lasersoft, the interface controller and the Xerox 2700 is available for $22,995.

BSA, 20343 Osborne St., Canoga Park, Calif. 91304.

UNIQUE AUTOMATION PRODUCTS, INC.
UAP-Link

Unique Automation Products, Inc. (UAP) has announced the expansion of its UAP-Link file transfer software line to include modules for the IBM VM/CMS and Unix environments.

UAP-Link was reportedly designed to transfer binary or text files among mixed or matched computers. According to the vendor, the package features a layered protocol that corrects line errors and data compression capabilities that increase throughput, and the system requires no conversion programs to reformat text data.

Additional features include single-user control, automatic transfer from dial to logoff, file protection, command files, smart terminal mode and global commands. The release permits the following equipment to be interfaced to the new modules through standard serial ports: the IBM Personal Computer and Personal Computer XT; the Digital Equipment Corp. Rainbow, VT180, RSX-11M, TSX-Plus and RT-11; and the Victor Technologies, Inc. Victor 9000.

The Unix version of UAP-Link is priced at $900, and the VM/CMS version costs $1,500.

UAP, Suite G, 15401 Redhill Ave., Tustin, Calif. 92680.

VIRTUAL MICROSYSTEMS, INC.
P-Bridge

Virtual Microsystems, Inc. has announced the P-Bridge system, which reportedly allows Digital Equipment Corp. PDP-11 and VAX-11 minicomputers to run software written for Softech Microsystems, Inc.'s P-system.

To accommodate four users, the product includes four Zilog, Inc. Z80 microprocessors, 256K bytes of random-access memory and a bit-slice state machine.

The cost of P-Bridge ranges from $5,000 to $7,500, depending on the host CPU, and includes the board, software that allows it to run and a license for the P-system.

Virtual Microsystems, Suite 720, 2150 Shattuck Ave., Berkeley, Calif. 94704.

DIGITAL EQUIPMENT CORP.
Mixed Packages

Digital Equipment Corp. has announced what the company termed "mixed packages" combining Decsystem-10 and Decsystem-20 computers with VAX-11/780 superminicomputers through DEC's Decnet networking software.

In addition, the company announced average price reductions of 20% on Decsystem-10 and Decsystem-20 mainframe systems.

The spokesman said the mainframe/VAX packages are connected through Decnet to interchange data and files. A typical mainframe/VAX combination, according to DEC, is a 1078 package consisting of a Decsystem-1091 mainframe and a VAX-11/780 superminicomputer with associated hardware and peripherals. This package is priced from $499,500 and will be available in late spring of 1984.

DEC said price reductions of mainframe packages and associated software are effective immediately.

DEC, 146 Main St., Maynard, Mass. 01754.

DATAMETRICS SYSTEMS CORP.
Torch/IO

Datametrics Systems Corp. has announced the Torch/IO system, which it described as a measurement tool for Sperry Corp. 1100 se-

Continued on page 49

Our PHAZE P3270 and P8000 product families are state of the art, feature-superior, modular workstations that operate in the IBM-compatible environment. These products are designed to be added into existing 3270 environments with an ease and value not found elsewhere. They emphasize our commitment to providing the very best in manufacturing, sales and service worldwide. And in every product we build, our corporate commitment to producing the finest machines available is our starting point. Unlike other companies, we aren't striving for quality, we *start with it.*

It is this same determination to provide quality and excellence that allowed us to bring our first products from drawing board to volume delivery in less than one year. Now, as we continue to expand our product line, we will be satisfying the needs, demands and expectations of 3270 environments anywhere in the world. Because that market is dynamic enough to grow and expand for many years to come.

So is PHAZE.

PHAZE

rius processors.

Torch/IO was designed to help operations managers, systems programmers and performance analysts minimize contention for mass storage space. A spokesman said that when many high-use files migrate to a particular device or string of devices, contention for access to that device causes excessive queuing to occur, and I/O service times degrade. Using Torch/IO, the files, file portions and devices experiencing performance degradation can reportedly be identified.

Once identified, files can be reassigned to minimize mass storage contention and reduce I/O service times. Torch/IO can be leased at $4,500 for a single CPU.

Datametrics Systems, Suite 201, 3040 Main St., Fairfax, Va. 22031.

VESOFT, INC.
Security/3000

A security software package for the Hewlett-Packard Co. HP 3000 series CPUs has reportedly been enhanced to limit access to selected subsystems, programs and operating systems commands even after end users have logged on.

With Vesoft, Inc.'s expanded Security/3000 package, access to system modules is reportedly limited through a menu concept in which an account manager creates a file listing all the options that users are authorized to execute. The account manager specifies the file name.

Security/3000 has also been enhanced to allow passwords to be set at any terminal and to monitor and automatically log off display units when they remain idle beyond a preset time limit. The package licenses for $2,400 from the company.

Vesoft, 9213 Warbler Place, Los Angeles, Calif. 90069.

APPLICATION PACKAGES

ARTHUR ANDERSON & Co.
Fin-Pac/38

Arthur Andersen & Co. has announced an accounts receivable system for IBM System/38 computers in companies of varied structures and in varied industries.

Fin-Pac/38 reportedly was developed in RPG-III to utilize interactive and data base facilities of the System/38 for timely and accurate reporting and collection of accounts receivable.

The company said that data entry, validation, posting, file maintenance and inquiry are performed on-line. Other features reportedly allow users to print selectively only those reports needed at a particular time and provide for foreign currency conversions.

The price for the system is $5,000, plus installation, according to the company.

Software Information, Arthur Andersen, 33 W. Monroe St., Chicago, Ill. 60603.

PRIME COMPUTER, INC.
Themis

Prime Computer, Inc. has announced Themis, an interactive logic simulator for digital electronic design.

The product offers mixed mode simulation capabilities, which allow users to model and test at the switch, gate, function or language level, the vendor said.

Themis incorporates features for accurate delay modeling and four-state, three-strength metallic oxide semiconductor circuit simulation, which helps ensure accuracy in large-scale integration or very large-scale integration design, according to the vendor.

The product runs on Prime's 50 series of compatible, 32-bit, virtual memory minicomputers, including the low-end 2250, under the vendor's Primos operating system. It is compatible with the system software available on Primenet and Prime's X.25 standard networking and communications system.

The standard package is priced at $20,000 for the Prime 2250 and $40,000 for all other Series 50 systems.

Prime Computer, Prime Park, Natick, Mass. 01760.

GENERAL ELECTRIC INFORMATION SERVICES CO.
Repmain

General Electric Information Services Co. (Geisco) has announced a software package that is said to provide comprehensive planning and control information for the repair and maintenance of operating facilities.

Dubbed Repmain, the package was designed for use in conjunction with Geisco's Mims system manufacturing package for IBM mainframes in the MVS and VM operating system environments. The vendor said Repmain consists of subsystems that can work separately or together.

The planning and tracking capabilities of Repmain address the primary components of the maintenance process, including spare parts, work orders and purchasing, the vendor said. The system was designed to store and process detailed data for assets and cost centers, and items requiring preventive maintenance on a periodic basis can be entered into the system generating work orders describing the work to be done.

According to the firm, the Repmain system is written in Geisco's

Finally a CICS query system that's as easy for the DP department as it is for the end user.

Introducing ExecuTrieve.

From the perspective of the DP professional, ExecuTrieve represents a dramatic breakthrough in query system efficiency.

No disruption. ExecuTrieve operates with your existing files in your CICS environment. It doesn't require costly system changes or any additional programming.

Low overhead. Through the use of our proprietary access method, users can browse or create complex reports with remarkably low I/O and CPU overhead.

Easy to install. ExecuTrieve can be installed and operational in as little as one afternoon.

Of course, efficiency is only half the story. ExecuTrieve makes as much sense for the end user as it does for you. Look at it from the other side.

Introducing ExecuTrieve.

From the perspective of the end user. ExecuTrieve is a remarkably simple, but powerful query system.

Easy to learn. ExecuTrieve is a free-format fully on-line system using simple English syntax and requiring no computer sophistication. An editor even allows you to correct errors anywhere in the text.

Quick response. Our proprietary access method means quicker response to even the most complex queries. In fact, the more complex the query, the quicker the response.

Complete reports. ExecuTrieve has a report generator and graphic capability. So it's a snap for non-pros to develop effective reports.

Efficient for the professional. Easy for the end user. Any way you look at it, ExecuTrieve is a query system worthy of investigation.

Call or write On-Line Software International.

ExecuTrieve for CICS from

"IDMS/R is the perfect DBMS for the IBM 4300 user."

Frank Chisholm*

*Frank L. Chisholm is Cullinet's Executive Vice President. Frank has worked closely with Cullinet users and prospective users for more than six years. As a key member of Cullinet's management team, Frank has contributed heavily to Cullinet's database product development strategy.

Because IDMS/R, with its Automatic System Facility, makes your IBM 4300 as easy to use as a personal computer.

The Automatic System Facility (ASF) is so comprehensive and easy to use that all an IBM 4300 user need do to develop an application is to define a relational record. ASF then dynamically generates all necessary supporting structures including data definitions, screen formats, application processing logic, and documentation. In other words, the developer can witness the application being produced, literally, in seconds. This is what makes ASF a major advance over fourth generation languages. Thus IDMS/R is the perfect system for the IBM 4300 user with limited staff resources.

But suppose when you build a complex, high volume production application with IDMS/R, you desire outstanding performance. Typically, 5% of the data relationships (joins) in any application are accessed 95% of the time. With IDMS/R you can simply change these relationships to predefined joins and benefit from a dramatic boost in performance.

We call it Relational Fastpath. This is what makes IDMS/R a unique relational DBMS, and a perfect system with which to build production applications. In addition, IDMS/R has the most sophisticated back-up and recovery capability of any DBMS, a full integration with personal computers and a complete line of integrated financial and manufacturing applications.

In summary, IDMS/R was designed to satisfy the requirements of the IBM 4300 user who wants to develop both production and end user applications faster and easier.

For further information, attend a Cullinet Seminar. Mail the attached coupon or call the Cullinet Seminar Center at 800-225-9930 (in Massachusetts 617-329-7700).

fourth-generation, nonprocedural Mims system language and is said to enable labor requirements to be planned and measured against availability and in planning inventory requirements. The vendor said all information pertinent to key maintenance activities can be clearly monitored and tracked. In addition, detailed costs, including spare parts, labor and overhead, can be tracked to work orders.

For clients currently using the Mims system, Repmain is licensed for $25,000.

Geisco, 401 N. Washington St., Rockville, Md. 20850.

INTERACTIVE SYSTEMS, INC.
Mentor

Interactive Systems, Inc. has announced an on-line data analysis and modeling package for Digital Equipment Corp.'s VAX-11 superminicomputers and Decsystem-10 and Decsystem-20 mainframes.

Called Mentor, the system is said to utilize literal names in addition to the conventional method of numerical row and column access. The vendor said that models developed in several different departments or divisions do not have to be laid out identically because Mentor can perform a consolidation on multiple models that use the same identifiers.

Mentor also features an interactive report writer that permits flexible reporting of data in a model without affecting the integrity of the model itself. According to the vendor, once a report format has been created, it can be saved for future use, and various report formats accessing the same model are also available. The system can store instructions for future use so that a user wishing to perform a task only has to input the correct commands.

Mentor is available at an introductory license fee of $5,000.

Interactive Systems, 131 Middlesex Tpke., Burlington, Mass. 01803.

HMS COMPUTER SYSTEMS, INC.
AIM/3000 Fixed Asset System;
AIM/3000 Billing System;
AIM/3000 General-Purpose Report Writer

HMS Computer Systems, Inc. has added three products to its AIM/3000 line of financial accounting software for the Hewlett-Packard Co. HP 3000 computer.

The Fixed Asset System provides property control for assets and calculation of depreciation and produces the information necessary to meet governmental reporting requirements, a spokesman said. Assets may be kept active for taxing purposes after they are fully depreciated for book purposes. The purchase price is $7,000.

The Billing System is integrated with the AIM/3000 Accounts Receivable or can be interfaced with an existing system. It has total billing and invoicing capabilities with the ability to restart from any specific invoice. The system accommodates printing of multiple addresses and recurring billings. It is priced at $2,000.

The General-Purpose Writer allows the nontechnical user to generate customized reports in minutes, the spokesman said. It is interfaced with all AIM/3000 systems and includes a preloaded data dictionary. It costs $2,000.

HMS Computer Systems, P.O. Box 35505, Building 9, 4504 E. 67th St., Tulsa, Okla. 74153.

PARA RESEARCH, INC.
Easy Text versions

Para Research, Inc. announced it has enhanced two versions of its Easy Text word processing package: One version runs on IBM's System/34 and System/36, while the second version was designed to be used with the System/38.

The Easy Text for the System/34 or System/36 has an added 30,000-word spelling checker that works in interactive or batch mode.

Enhancements to the System/38 version of Easy Text include automatic line centering, automatic text conversion for 48- and 64-char. printers and paragraph indenting.

The Easy Text is priced at $750 for the System/34 and System/36 and $1,500 for the System/38.

Para Research, 85 Eastern Ave., Gloucester, Mass. 01930.

LANGUAGES

SOFTWARE CONSULTING SERVICES, INC.; BRITISH STANDARDS INSTITUTE
Pascal Validation Suite Quality Control; Standard Pascal Model Implementation

Software Consulting Services, Inc. and the British Standards Institute have jointly announced the Pascal Validation Suite Quality Control package and the Standard Pascal Model Implementation system.

The Pascal Validation Suite (PVS) system consists of 724 test programs that are said to exercise systematically a Pascal compiler to determine its ability to process programs written in International Standards Organization Standard Pascal.

The Standard Pascal Model Implementation (SPMI) is said to be a complete Pascal implementation.

Both PVS and SPMI are available in machine-readable source code for $450 each.

Software Consulting Services, Ben Franklin Technology Center 125, Murray H. Goodman Campus, Lehigh University, Bethlehem, Pa. 18015.

You want quality products when you buy financial applications software, but it's tough to measure before the buying decision is made.

At Data Design, we measure product quality four ways.

● By product features that make it easy to implement, use and maintain.

● By our track record for reliability, the result of our extensive in-house Quality Assurance program.

● By effectiveness of our documentation, which is the industry's best.

● And by results, which we let you calculate for yourself by talking to *any* customer who has ever installed our financial applications software.

You'll find measurable quality in Data Design's Fixed Assets and Accounts Payable/Purchase Control systems. We engineer them with modular architecture, making them flexible enough to adapt rapidly to changing financial requirements. Data Design's Data Mapping Facility, an exclusive feature of our advanced system architecture, gives users the power to adapt the system to changing conditions.

Our applications systems are written in ANSI COBOL and designed for large and medium-scale computers. Their quality has already been measured by hundreds of U.S. corporations—many of whom use McCormack and Dodge, Software International, or MSA general ledger systems but came to us for Fixed Assets and Accounts Payable.

And you'll find the same measurable quality in Data Design's soon-to-be-announced General Ledger System.

See how we measure up to your needs. Call us at (408) 730-0100 from inside California or toll-free from any other state at (800) 556-5511.

Please send information on the following Data Design software:

SOFTWARE & SERVICES

PLUM HALL, INC.
C Programming Workshop; Advanced C Topics; Unix Workshop

Plum Hall, Inc. has announced three five-day introductory courses in the basics of programming in the C language, advanced C topics and programming in Unix.

According to Plum Hall, the seminar materials are available for unlimited internal use through a sublicensing agreement. The C Programming Workshop is an introduction to C for programmers, while the Advanced C Topics seminar covers efficiency, portability and other software engineering topics. The Unix Workshop emphasizes software development.

Internal use of each course is priced at $10,000.

Plum Hall, 1 Spruce Ave., Cardiff, N.J. 08232.

REMOTE COMPUTING SERVICES

CITIBANK
Citiintegrator

Citibank has introduced Citiintegrator, an IBM Personal Computer- and Personal Computer XT-based treasury management system that automates data collection and reporting of bank balance information and serves as a "window" to Citibank's electronic banking and cash management services.

The software is said to provide integration with Lotus Development Corp.'s Lotus 1-2-3 and can link any independent data base using an autodial feature.

Citibank electronic banking services that can be automatically accessed through Citiintegrator include Citicash Manager, Cititreasury Manager and Citibanking.

Citiintegrator's data retrieval and autodialing capability costs $5,000; report consolidation costs $7,500; and target balance consolidation costs $2,500.

Citibank, 399 Park Ave., New York, N.Y. 10043.

ON-LINE DATA BASES

DOW JONES & CO., INC.
Dow Jones Spreadsheet Link

Dow Jones & Co., Inc. has announced a microcomputer-based software product that provides an interface between the Dow Jones News/Retrieval interactive information service and Visicorp's Visicalc, Microsoft, Inc.'s Multiplan and Lotus Development Corp.'s Lotus 1-2-3 spreadsheets running on Apple Computer, Inc. hardware.

The Dow Jones Spreadsheet Link allows users to download data from News/Retrieval into the spreadsheet. A version for the IBM Personal Computer will be available later in the first quarter of 1984.

Dow Jones, P.O. Box 300, Princeton, N.J. 08540.

TRAINING

Data Kinetics Ltd. has announced two training courses focusing on Information Builders, Inc.'s Focus fourth-generation software system.

The courses, Focus Retrieval and Reporting and Focus Programming Workshop, are said to emphasize the user-oriented capabilities of the Focus language. In addition to reporting, the workshop teaches the more complex tools including defining, loading and updating files and data bases, a spokesman said.

It is intended for the experienced programmer interested in building systems. Focus Retrieval and Reporting is said to be a three-day course, and the Focus Programming Workshop is a five-day course.

Reporting course is priced at $4,500, and the Focus Programming Workshop is priced at $6,000.

Data Kinetics, Education Department, 97 Norman St., Ottawa, Ontario, Canada K1S 3E5.

GOAL SYSTEMS INTERNATIONAL, INC.
Design course; Vsam/BC course

Goal Systems International, Inc. has announced two computer-based training (CBT) courses.

The Design course for new CBT authors, project managers or administrators is said to be an introduction to the development and administration of CBT courses.

The six-hour course discusses learning principles and their application to the construction of questions.

Vsam/BC is a four- to seven-hour course that is geared toward system and application programmers in IBM Vsam environments. The course does not cover coding of utilities or requests.

Both Design and Vsam/BC are priced at $3,780 for a permanent license.

Goal Systems International, 5455 N. High St., Columbus, Ohio 43214.

BECOME A CICS CONSULTANT IN JUST TWO WEEKENDS.

We know that it's tough for consultants to fit a weekday course into their hectic schedules. That's why SysEd offers special CICS training courses for consultants that you can complete in only two weekends.

Our intensive weekend courses in Command Level, Macro Level, Internals, Application Design and VSAM are designed to make even non-CICS programmers immediately productive in a CICS environment. Each SysEd course provides a true-to-life learning experience with "hands-on" use of the computer; up-to-date, practical information; a solid foundation in CICS fundamentals and insights into advanced materials; and individual attention from highly qualified instructors.

SysEd's special weekend courses for consultants are held regularly at our classroom/computer facilities in New York City, Chicago, San Francisco and Dallas. Because class size is limited, applications are on a first come, first served basis.

For more information, call David Shapiro (212) 889-3366.

PBX nullifies net predictions

DATA STREAM

JIM BARTIMO

The problem with predictions is that they are always based only on facts existing in the present. So, the futurists of the 1950s predicted space colonies after the launching of *Sputnik* and robots after the advent of the home appliance.

Because these futurists of yesterday had no information on the microprocessor, they could not have predicted the widespread use of computers, communications or even video games.

Similarly, the futurists (read: consultants) of the last three years have been predicting the widespread use of local-area networks. Based on the information available in 381, predictions that most peripherals and computers would share data over a Xerox Corp. Ethernet or a Wang Laboratories, Inc. Wangnet were justified. Users wanted connections; why not wire devices together?

But things have changed in the last few years. First and foremost, the private branch exchange (PBX) now offers local networks with their new nonblocking architectures. While transmission rates are lower over the twisted pair wiring of the voice world, so is the price.

Not only is the PBX an attractively priced alternative to local-area networks, it is beginning to look as if

Deregulation may oust vendors

By Lynne Hefner
CW Staff

SAN JOSE, Calif. — While deregulation will create significant new revenue opportunities for data communications equipment and services suppliers, the associated disruption will eliminate many vendors, according to a report recently released here.

The report, "Data Communications Markets: Impact of Deregulation," published by Strategic, Inc., projects that the shift of major carriers from universal service to a competitive price-based marketing environment will trigger fundamental problems in the data communications market and cause major headaches for the user community.

Among the negative effects will be a reduction in the quality of switched network transmission. This, in turn, will reduce the revenues that would have otherwise accrued to the independent high-speed switched network modem vendors and force the restructuring of the data communications services submarket into specialized transmission and value-added network segments, as users scramble for reliable services.

"Deregulation will create a healthy market environment for the network management product sector of the data communications equipment submarket," the report said. "This sector, which includes hand-held analog and digital test sets, along with technical control and network management systems, will increase from $472 million in 1984 to over $1.1 billion in 1988, showing an average annual growth rate of 25%."

On the other hand, Strategic pointed out, the associated need for leased services will create additional revenue opportunities for those multiplexer vendors that cater to the needs of the network service suppliers. The inevitable reduction of network reliability will also enhance the sales prospects of test and diagnostic equipment vendors.

The report also projects that new high-volume semiconductor technology, rapid progress in fiber optics, excess satellite capacity and the economics of digital transmission will combine to stimulate the introduction of a broad range of alternative methods of data transmission.

Strategic's report discusses the major influences that will drive this market for the rest of the decade and warns of potential problems that may affect corporate strategy. The report costs $1,500.

Strategic, P.O. Box 9747, San Jose, Calif. 95157.

Digital's DR Soft/Net links micros

A software package that can reportedly link microcomputers running its CP/M operating system via any local-area network was announced here by Digital Research, Inc.

Introducing its new DR Soft/Net package, the company claimed the product enables offices to tie together diverse personal computer workstations using local-area networks such as Xerox Corp.'s Ethernet, Datapoint Corp.'s Arcnet and Corvus Systems Inc.'s Omninet.

The package is said to interconnect micros running any version of Digital's CP/M, CP/M 86 and Concurrent CP/M operating systems.

Networking features reportedly include file sharing, password protection and record and file locking. In conjunction with Concurrent CP/M, DR Soft/Net is said to provide a file-server capability at each workstation. According to the vendor, users are able to share files and transfer information while

TUTORIAL

Communications manager to emerge from automation

By Steven S. Lubow
Special to CW

With the communication of information fast becoming the most essential function of the automated corporate office, the emerging new breed called the communications manager must be a key decision maker in a company's information management process.

The rapidly changing business world demands that voluminous amounts of mostly computer-generated data be delivered quickly and in usable form to many levels of decision makers and specialists throughout an organization.

Communications, however, costs enormous amounts of time and money, which means that — for corporate survival — the escalating costs of processing information must be reduced. Also, the growing library of company-developed software must eventually be networked for optimum efficiency.

Many companies still believe that a well-tuned office automation capability can address these issues because of the manager's familiarity with in-house computer systems and the word and data processing needs of all company functions.

What top management does not realize is that virtually all information management is now a communications matter and can no longer be the exclusive province of the data processing, information system or office automation manager. The communications manager — who is the only one with an overview of every department's communications needs — has to be involved in the decision-making process from the beginning.

Ideally, of course, the office automation manager should incorporate communications into his sphere of expertise, and the communications manager should be knowledgeable about office automation. Even more ideally, their two departments should merge into one. At the very least, however, both should work together for cost-effective results, with each implementing critical assigned functions.

For instance, just as a company's traffic manager (not the senior accountant) decides on the most cost-effective way of shipping a product, the communications manager (not the office automation manager) should be the one to choose the appropriate method of transporting information.

Communications technologies are now at a developmental level comparable to where data processing was 15 years ago and are moving forward rapidly. Data processing tends to accommodate mainly traditional business practices and is not likely to advance beyond that stage unless there is a major shift in the way companies operate.

The advent of affordable data communications systems brought about by inexpensive microprocessors has significantly influenced the rise of communications technology. What is being done today in this area was not possible just two or three years ago, because certain integrated chips were not available.

As an example, the function of a modem the telephone company currently rents for about $75 per month can now be performed by a chip that costs only about $30 to buy.

Choosing the technology for transporting information requires strategic planning, and this logically falls within the scope of the communications manager. In this capacity, he can reduce office automation's work load by selecting office equipment that not only has communications capabilities, but can take over some of the processing load at remote workstations. Any excess loads on the central DP computer can then be shifted to the office automation side of the house or to the communications processor.

In addition to his role in office automation, the communications manager should play a vital part in a company's networking, which is

See MANAGER page 54

PBX

from page 53

it could be the hub of the automated office.

Second, IBM has yet to give local-area networks its blessing by releasing a product in this field. Although hinted at time and again, IBM's entry into this market seems less and less likely.

Big Blue seems content to stick to its Systems Network Architecture (SNA) method of connectivity with last year's introduction of the 3270 Personal Computer. IBM has not ignored the PBX network either, by investing heavily in Rolm Corp.

The final blow to local-area networks may be the high-flying predictions of the futurists. The gap between hype and reality has weakened the confidence of the data manager to invest too heavily in a technology stuck at the starting gate. When no one will invest in a technology, prices stay high, and when prices stay high, no one will invest.

But perhaps another new development, such as telecommuting, will make host-based networks the darling of the communications industry once more. Perhaps users were just waiting for the recession to subside before investing heavily in communications equipment.

There are many reasons to believe the local-area network is not dead — but the same could be said of the space station and the robot.

MANAGER

from page 53

becoming more critical and complex as demand for information continues to increase.

Again, because of his overall view of an organization and its local, regional, national and global operations, the communications manager is in the best position to apply cost-effective concepts and technology to the equipment and services required to solve business communications problems now.

The communications manager is also the one who will be ready with the right solutions 10 years from now. Communications is, after all, a long-term proposition, and today's communications manager must place more emphasis on planning than on the actual operations of communications.

The communications manager cannot afford to indulge in short-term solutions, except as they fit into the context of a more comprehensive strategic plan.

A long-term plan would allow corporations to buy three units now instead of committing to 20, because the next five units scheduled for purchase would provide more advanced technology and, probably, more capability.

Corporations, particularly those that are watching expenditures (and which ones are not?) are beginning to realize that the communications manager is in a position to save them millions of dollars — not just in direct costs, but also through more efficient office operations and equipment planning.

If communications is coming of age, so must the communications manager.

Lohera is chairman and president of Intelligent Communications Networks, Inc., Ventura, Calif.

LINK

from page 53

running an application.

DR Soft/Net does not require dedicating a separate workstation CPU to supervise networking, Digital claimed, and its multitasking capabilities also support transferring data between local and remote processors via a local network, thereby providing full distributed processing.

The product will be sold for $1,000. Digital Research also announced a new compiler design, the first example of which, a compiler for Fortran-77, will be released in January, the company said.

The Fortran-77 compiler, priced at $500, will be the first of five new compilers to use the technology and will run on Concurrent CP/M and CP/M-86 operating systems.

Digital Research, 160 Central Ave., Pacific Grove, Calif. 93950.

Science Dynamics offers ACT-LTBR

Science Dynamics Corp. has announced the ACT line trunk billing recorder (LTBR) a microprocessor-controlled terminal that records accesses to telephone operating company equipment.

The product may be used with both electromechanical and stored-program controlled telephone company switching systems. The unit includes 24 electronic meters for each input to record the number of inbound and outbound accesses and their duration for each rate period — day, evening and night, according to the vendor.

The ACT-LTBR terminal includes a built-in control panel for programming trunk and line parameters to suit each installation.

Each input is individually programmable to accommodate various types of loop, ground start or electrical and mechanical signaling, or units may also be programmed from a central site, according to the vendor.

Other terminal features include security code protection, battery-protected memory, a perpetual calendar and modular construction, the vendor said.

A basic ACT-LTBR to accommodate 16 lines or trunks is priced at $3,150.

Science Dynamics, 1919 Springdale Road, Cherry Hill, N.J. 08003.

RED HOT DEMO.
SEE THE NEW ENVISION 430.
IF ITS NOT MORE THAN
A COLOR PRINTER,
IT'S FREE.

You really can't lose. Because if we can't prove our new Envision 430 Color VectorPrinter™ is more than a color printer, we'll give it to you on the spot. Free.

WHAT YOU DON'T KNOW

What you might not know is that our new 430 has the uncanny ability to print high resolution pen plotter graphics. It can do that because we designed vector-to-raster conversion right into the printer.

And to make our 430 that much better than any other color printer you can buy, we also gave it the ability to print 100 characters per second in letter quality mode or 300 characters per second for drafts. This means our 430 gets your work done a lot faster. It also means you can print high speed drafts, letter quality text, high resolution raster graphics and plot vector graphics—on the same page! So when you buy our new 430, you're really getting four very usable talents in one very versatile printer.

A VERITABLE PARADISE OF COLOR

Even if you're not a Van Gogh, our new 430 gives you the ability to create inspired color graphics. It prints any four colors of red, green, blue, cyan, magenta, yellow or black in a single pass. You can also blend any of these colors to create an entire spectrum.

And because a one-eighth inch solid color band is printed on each pass of the 18-wire printing head, our 430 creates your masterpieces with incredible speed.

UNCOMMON VECTOR/RASTER GRAPHICS

We made our 430 compatible with the Hewlett Packard 7220 pen plotter. That means it's supported by a host of business, engineering, and scientific graphics software packages. And it gives you printed quality that's nothing short of superb. As well it should. Because we designed our 430 with exceptionally accurate horizontal and vertical registration. It also prints raster graphics at 360x144 dots per inch for the highest resolution or 72x72 dots per inch for maximum speed. And to give you added flexibility, we gave our 430 the ability to print on plain paper *and transparencies.*

LETTER QUALITY MAGNA CUM LAUDE

When you begin using our 430 you'll quickly discover you don't have to be a wordsmith to create letter quality documents with punch. Any of the character fonts can be mixed or colored using host computer control.

WORDS, 4444 (characters), lines or pages CAN BE PRINTED in any of EIGHT COLORS. One letter quality font in 10, 12, and 18 PITCH and one high speed font in 10 and 12 PITCH ARE STANDARD. This means you can make MESSAGES STAND OUT You can COLOR specific words or IDEAS

And our 430 comes with optional letter-quality character fonts like **BOLD**, *italic*, SCRIPT and ORATOR. Plus you

COMMUNICATIONS

PROTOCOL CONVERTERS

CONNECTICUT MICROCOMPUTER, INC.
Buster GR

Connecticut Microcomputer, Inc. has announced a microprocessor-based interface designed to allow computers with IEEE-488 interfaces to communicate with devices that have standard RS-232 interfaces.

The Buster GR is said to facilitate connections between processors and printers, modems, terminals, mainframes and other computers.

Programmed through Basic commands from the host IEEE-488 computer, Buster GR reportedly features selectable bit/sec rates from 75 to 19.2K, 110-char. input buffer and parity and word-length selection.

The unit, currently available, costs $495 for a standard version.

Connecticut Microcomputer, 36 Del Mar Drive, Brookfield, Conn. 06804.

PROTOCOL COMPUTERS, INC.
PCI 176

Protocol Computers Inc. (PCI) has announced the immediate availability of its new Series 100 protocol converters which, the vendor claimed, enables Ascii terminals to communicate with IBM hosts.

The Series 100 includes four models:

- PCI 176, which supports up to seven personal computers and/or Ascii terminals and printers, according to the vendor.
- PCI 167, which, the vendor said, allows IBM 3767 users to substitute Ascii terminals, printers, teletype terminals, graphics plotters and micros for IBM Systems Network Architecture (SNA) devices.
- PCI 151, which reportedly allows non-IBM Ascii terminals and printers to be linked to IBM's System/34, 36 and 38 computers.
- PCI 171, which provides Ascii to bisynchronous conversion for non-SNA IBM applications, according to the vendor.

Pricing for the PCI 171 and 176 starts at $1,950 and at $2,850 for the PCI 151 and 167.

Protocol Computers, 6150 Canoga Ave., Woodland Hills, Calif. 91367.

COMMUNICATIONS SOFTWARE

SOFTWARE DEVELOPMENT AND MAINTENANCE, INC.
SDM3780

Software Development and Maintenance, Inc. (SDM) has announced a communications software product that is said to enable IBM users with OS and DOS operating systems to transfer data to any other computer, terminal or remote entry device that supports 2780 and 3780 communications protocols.

Known as SDM3780, the software system emulates a remote job entry workstation for the IBM subsystems JES and Power. Also, SDM3780 can support file-to-file transfer as either the host or the terminal, using any combination of hardware and/or software subsystems it supports, SDM said. SDM3780 runs under any IBM DOS/VSE, OS/VS1 or MVS operating system. Communications are performed via IBM 2780 and 3780 Binary Synchronous Communications protocols using Vtam.

SDM3780 is priced at $4,500 for the DOS version and $5,000 for the OS version.

SDM, P.O. Box 668, 124 Spring Ave., Fuquay-Varina, N.C. 27526.

LOCAL-AREA NETWORKS

KANTEK, INC.
Kannet

Kantek, Inc. has announced Kannet, a local-area network that can support up to 254 computers of dissimilar types with several different operating systems.

According to the company, fully transparent format translations make it appear to each computer that all other computers are the same type it is. The operating systems supported by the Kannet system include Microsoft, Inc.'s MS-DOS, IBM's PC-DOS and Digital Research, Inc.'s CP/M 86 and CP/M 80. All operating systems may reside on the network concurrently, Kantek noted.

The Kannet system is priced at $1,295 for each computer in the network.

Kantek, Suite J, 1370 N.E. 20th, Bellevue, Wash. 98005.

AUXILIARY EQUIPMENT

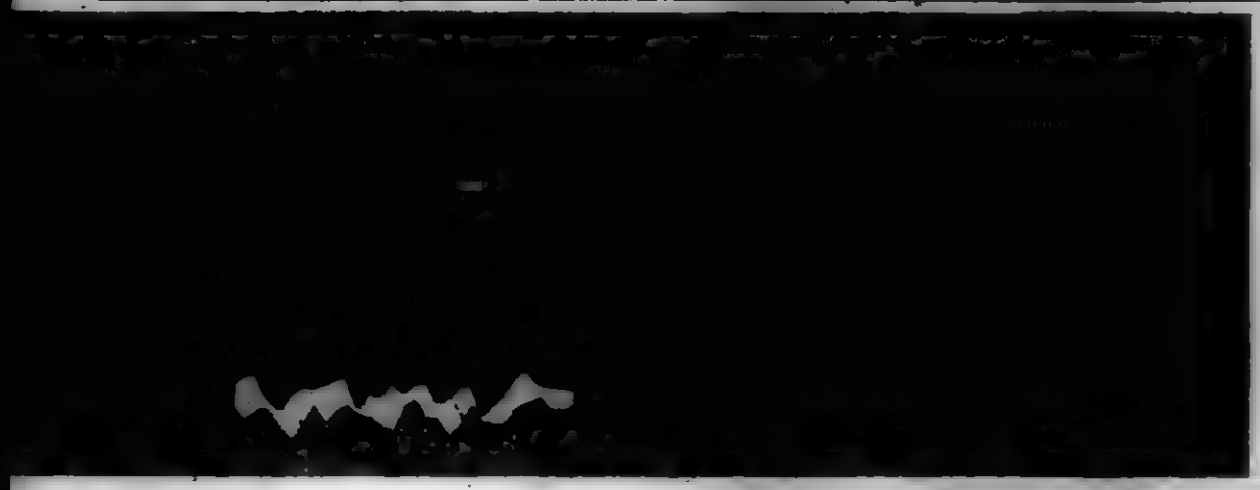
COMMUNICATIONS PUBLISHING GROUP, INC.
"Fiber Optics Coupler & Connector Patents"; "Fiber Optics Fiber & Cable Patents"

Communications Publishing Group, Inc. has published two reports concerning fiber-optic patent activity from 1963 to 1983: "Fiber Optics Coupler & Connector Patents" and "Fiber Optics Fiber & Cable Patents."

The reports contain fiber-optic patent numbers, descriptions of each patent, reproductions of selected patents and names of whomever was assigned a patent.

The reports cost $125 each.

Communications Publishing Group, P.O. Box 383, Dedham, Mass. 02026.



can define up to 196 characters to print both text and graphics. And to add versatility to your text creations we made our 430 compatible with the Diablo 630 ECS. Which means it supports the most popular text and word processing packages.

NO MORE RIBBON WASTE

Another nice little benefit of our 430 you won't find in other color printers is a four-cartridge ribbon system. Our separate color cartridges advance independently as each color is used. By doing things this way you don't end up wasting ribbon or running out of the color you want just when you want it. It also means lower cost per copy for you. Plus you also have a choice of high quality mylar ribbon cartridges and longer life nylon ribbon.

YOU DON'T HAVE TO PASS UP SPEED FOR QUALITY

Our 430 has been designed with an 18-wire printing head. This means that instead of having to pass over a line more than once to achieve high quality, our 430 prints letter quality characters in a single pass. It also does this with a great deal more speed because it never has to retrace the same line.

And while we're talking about speed, you should know we built our 430 with a print control microprocessor which tracks the carriage through a unique closed-loop servo system and adjusts for carriage speed and direction during dot placement. That permits it to print while the carriage accelerates. Which is another reason it gets your job done a lot faster.

THE 430's UNFORGETTABLY EFFICIENT

If you tear down our 430 you'll find two 16-bit microprocessors. One of them controls the printing mechanism; the other takes care of the host interface and command interpretation.

They both share a 128K-byte bit-map memory. So while you're busily telling the 430 what to print next— it's busily printing what you told it to print last.

A RED HOT DEMO

We think you'll be impressed when you see our 430. But that's not enough to get you to pick up your telephone and call. So if we can't prove it's more than a color printer, we'll give you a 430. Free.

Show a little sporting interest and take us up on our offer. You'll get a red hot demo and a chance to buy a printer and a plotter. Send us the coupon or call. Envision, 631 River Oaks Parkway, San Jose, CA 95134, (408) 946-8755 or Telex: 176437.

Introducing COMPAQ PLUS, the first high-performance portable personal computer.

The makers of the COMPAQ™ Portable Computer, the industry standard, announce another breakthrough—the COMPAQ PLUS™ Portable Personal Computer. No other personal computer can handle so much information in so many places.

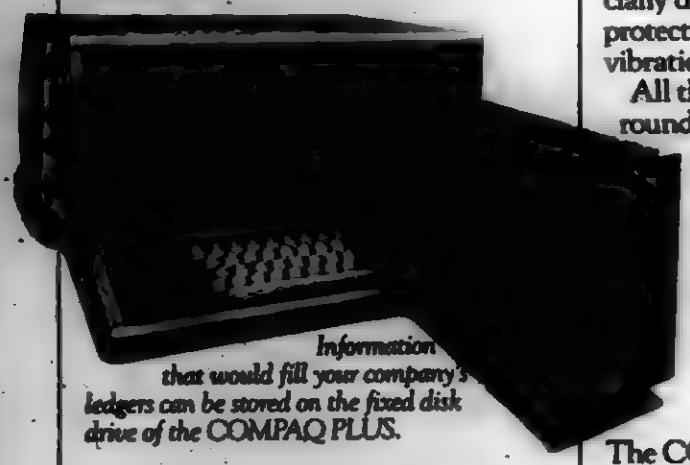
The new COMPAQ PLUS offers an integrated ten-megabyte fixed disk drive in a portable.

Plus a bigger payload

How much is ten megabytes?

Enough to tackle jobs that can't be conveniently handled on most personal computers.

A mailing list of 100,000 names and addresses.



Information that would fill your company's ledgers can be stored on the fixed disk drive of the COMPAQ PLUS.

Inventory records on a quarter million items.

The entire San Francisco phone book, with room left for Peoria.

Your most used programs can be permanently kept on the fixed disk drive of the COMPAQ PLUS, ready to call up and run.

Store a library of accounting programs—payables, receivables, general ledger, and payroll—*with* the company's books. Then take them to a board meeting or a branch office.

Your inventory control program and your inventory records can go with you to the factory. Your building specs and your project management programs can go with you to the construction site.

The high-capacity portable multiplies the productivity of every program it runs.

Plus more programs

The COMPAQ PLUS runs all the popular programs written for the IBM® Personal Computer XT, available in computer stores all over the country. And they run with no modification whatsoever.

You're buying a computer to solve problems. Why not have more problem-solving programs to choose from?

Plus a traveler's toughness

A true portable has got to be tough. The COMPAQ PLUS is.

Its fixed disk drive is designed specifically to travel. Rough roads and hard landings don't bother it because a specially designed shock isolation system protects the disk from jolts and vibration.

All the working components are surrounded by a unique aluminum frame with cross-members that strengthen it side-to-side, front-to-back, and top-to-bottom.

Does a portable personal computer really have to be this tough? Take a look at your briefcase and then decide.

Plus a lot more

The COMPAQ PLUS comes with a 360K byte diskette drive for entering new programs and copying data files.

The COMPAQ PLUS also works with optional printers, plotters, and communications devices designed for

The COMPAQ Portable, the industry standard in portable personal computers. ▼

The problem-solving power of a high-performance desktop personal computer can now go where you need it.

IBM's personal computer family.

It has two IBM-compatible slots for adding optional expansion boards. With companion programs, they'll let you network with other personal computers, communicate with your headquarters computer files or add memory capacity if your needs grow.

When you see all that COMPAQ PLUS has to offer, you'll be pleasantly surprised by the price. The fact is, it costs hundreds less than comparably equipped desktop personal computers.

See the first high-performance portable personal computer. The COMPAQ PLUS—performance, programs, productivity. Plus problem-solving power.

Newest PBXs to provide exclusive service

By Neil Weber
Special to CW

When hand-held digital calculators first hit the market, they were marvels of miniaturization and electronic design. They were also very expensive. But for people who needed that level of computational power, they were the only game in town. Then, only months later, similar or even more sophisticated models were flooding the market at vastly lower prices.

Today, users and potential users of digital telephone-switching systems are about to face this dilemma. "Fourth-generation" private branch exchanges (PBX) are now on the drawing boards of several manufacturers, replete with sophisticated enhancements that sound utterly fantastic. In the near future, a number of these new systems will be brought to market.

Like the digital calculators, these new PBXs will at first be relatively expensive, and, for a time, they will have their share of bugs.

Predictably, most companies will follow the classic pattern of waiting to buy only when the product is attractively priced and thoroughly proven. However, those few companies that do "take the plunge" will gain an exclusive period of valuable service from these new switches.

The fourth-generation PBX will incorporate all of the current capabilities and will provide vastly greater data transmission capacity and speed-along, as well as a host of "convenience" features.

But even more important, the new PBXs will integrate voice and data transmission capabilities into a single device. Thus the stage will be set for the PBX to act as a complete protocol and format translator, capable of linking virtually any two computers. In effect, then, the new generation of PBXs will soon open the door to data bases anywhere in the world, regardless of the computers involved.

At the present time, a company that requires a great deal of data transmission through its PBX system must employ a separate data switch, which generally costs between $100,000 and $200,000. With the fourth-generation PBXs, however, no additional data switches or expensive external modems will be required.

Hence, the quandary of companies in search of a state-of-the-art PBX. In making their decision to buy or to wait, these companies will need to consider a number of factors.

Companies employing a moderate number of lines (200-600) and a comparatively low volume of transmitted data should be especially careful in projecting their future requirements before investing in a fourth-generation system. It may be a long time before such a company can utilize all of the features available with today's systems, much less those of fourth-generation systems.

The capability to handle data traffic better is in most cases the prime rationale for acquiring a fourth-generation system. Thus, companies that do not have extensive data transmission requirements will do well to question the need for such an advanced PBX.

Furthermore, these companies will take comfort in the proven reliability of third-generation systems. As the product of several years of design experience, third-generation PBXs are virtually free of problems associated with voice transmission.

Fourth-generation systems, however — designed "from scratch," so to speak — will require a period of time before they offer a comparable level of reliability in the realm of data transmission.

Neil Weber is director of Product Marketing at Harris Corp.'s Digital Telephone Systems Division.

NETWORK HEALTHCARE

DATA COMMUNICATION NETWORKS AREN'T LIKE PEOPLE BUT...

One thing's for certain. Poor advice early in the design stage, the wrong equipment, or inadequate product support could make your network very sick.

We can help prevent that. Meet ComDesign's data comm "doctors". They are a group of dedicated, service oriented data communication specialists. Talented, qualified, and helpful, they dispense the application engineering answers that will keep your network in the pink. For large networks or small. And you don't have to be a ComDesign customer to take advantage of this service. As a matter of fact, you'll never even need an appointment. Just use the toll-free number below. The doctor's always in.

The right application software package — does the choice get blurred?

Help is on the way from *Computerworld* this January

The ever-increasing requests for office software; the demand for tools by programmers and users alike; the bewildering array of products to choose from — make the job of selecting applications software challenging and difficult. Here's what you'll get from this January's Special Report on Applications Software to make your job easier:

- The packaged decision: Should you buy, or develop in-house?
- Methods of selecting the best application for your needs.
- Modifying and maintaining packaged applications.
- Integrating applications from multiple vendors.
- Conversion stories.
- Integrating micro with mainframe applications.
- Applications for manufacturing.

You'll get information on who should select packaged applications. You'll read about the impact of application generation tools on selecting packaged solutions. And you'll get pages of fact-filled ads for products to keep you up-to-date on just what's new. If you buy, choose or recommend applications software products — you won't want to miss this special report in *Computerworld's* January 30th issue.

And if you've got packaged software products our readers want to know about — then you need to get your ad to us by January 13 to be included in the Special Report. To reserve space in this issue, call Don Fagan, Vice President Sales/Marketing; Ed Marecki, National Sales Director, or Kathy Doyle, Marketing Support Manager at (617) 879-0700. Or, call one of the sales offices listed below:

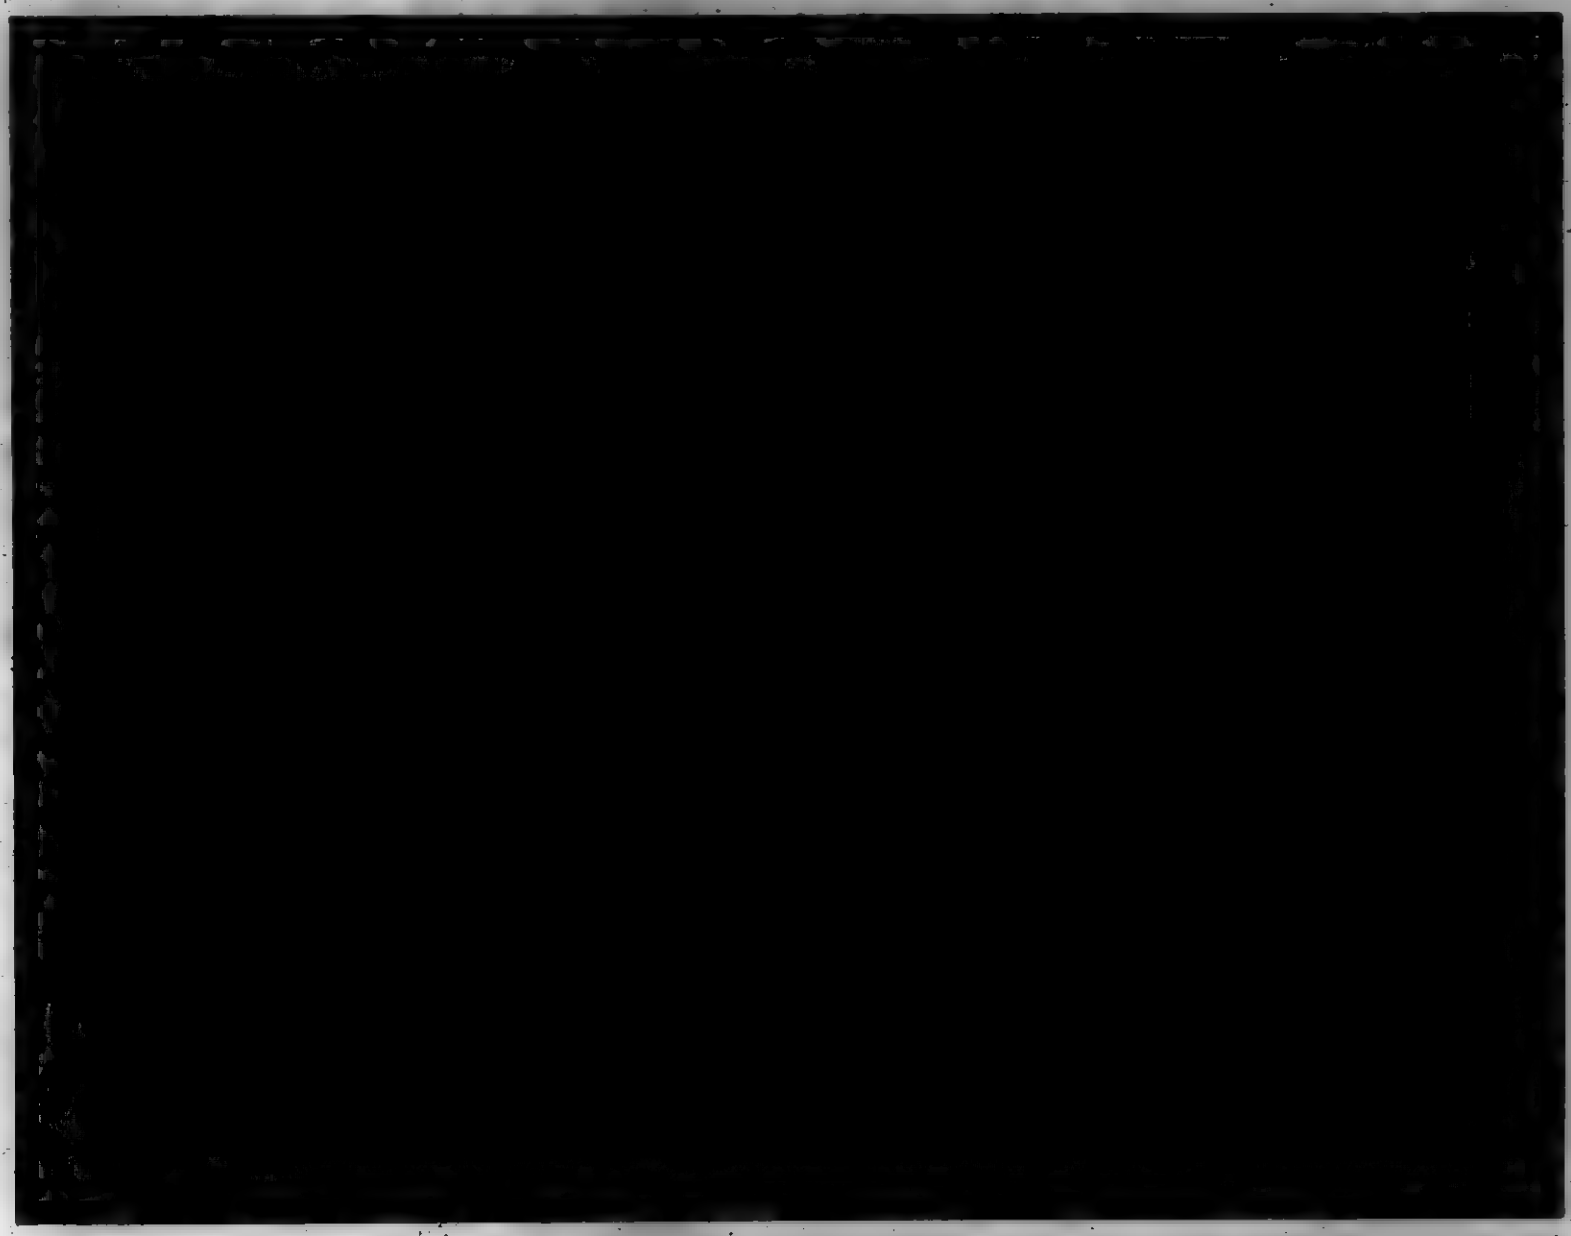
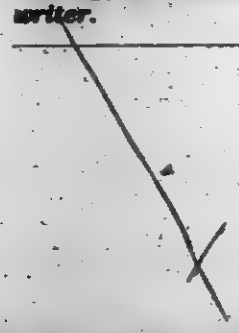
IN DEPTH



The rise of the technical writer

The technical writer is, at least in some systems departments, an equal member of the development team. Projects are now more user-driven, demanding an effective liaison between user and technician — namely, the technical writer.



By Gene Knauer

In the rush to develop systems that meet the immediate or imminent needs of a management information systems environment, documentation often receives low priority. And traditionally, technical writers have lagged behind systems and user staff in both salary and status.

But the picture has changed significantly in recent years and continues to brighten. With greater acceptance of documentation as an important element of systems development, pay and responsibilities for writers are growing.

In a typical development situation, the programmer builds a system along linear patterns of logic. He usually jots down notes about a system in the order that his ideas come. These notes rarely constitute concise system documentation but can form an initial draft.

Enter the technical writer. From amidst the twists and turns, contradictions and omissions of the programmer's notes, the tech writer must synthesize and extract a clean, clear set of user instructions for the new computer system. The writer seeks to uncover the hidden logic in a program and then to convert it into a hierarchical pattern, with a main function at the top and subfunctions below.

"The writer is always seeking," says John Urton, a technical documentation consultant at the Federal Home Loan Bank in San Francisco. "He's always asking, 'What's this? Why isn't this working? Let me see that.' Once the system is designed, people want him to go away."

Technical writers in most MIS environments are usually activated about the time that new systems design and implementation staff are moving on to other projects. Friction often results from the technician's lack of interest in a system that is already history to him. The questions tech writers ask about the system to be documented force the programmer/

analysts to rehash old work.

"Often," says Lois Pryor, co-owner of Echols & Pryor Technical Communications in Berkeley, Calif., "the questions are seen by the systems staff as intrusions on their thought processes, which are now focused on equally complex and challenging new systems." When the tech writer uncovers mistakes or weaknesses in a system that reflect badly on its authors, friction between the two groups may turn into open hostility.

Pryor's partner, Carla Echols, remembers when "tech writers were traditionally the people who did the typing in the offices in Silicon Valley. They had the status of clerks." This situation contributed to the friction.

But changes in the development environment are now promoting greater harmony in the workplace. Among the improvements is a growing overlap in the responsibilities of systems staff and writers.

A variety of schemes for organizing documentation efforts, subspecialties within tech-writing ranks and a burgeoning tech-writer consulting market now exist.

Armed with new knowledge about systems technology and the development process, the user expects more from documentation, based on his experience with manuals from popular micro packages. Dry technical prose isn't acceptable anymore. Graphics, tutorials, flowcharts, on-line help screens and quick reference cards are part of the new generation of documentation tools.

Environmental portraits

At MIS environment A, tech writers are regarded as editors. Given specifications by the systems staff, their charge is merely to edit rather than extensively rewrite.

At environment B, tech writers are equal members of systems development teams. Using a homegrown methodology, the tech writer helps monitor the project and serves as the repository and synthesizer of all information. Documentation is developed before systems, in some cases, are ever designed. Drafts of these early documents, which describe how a system will work or should work, are circulated among programmers as part of the design process. Eventually, revised versions of these initial documents become user documentation.

At environment C, no tech writers are employed. Since the users are technically oriented, they don't need documentation simplified to the normal level of nontechnical user friendliness. The shop's systems analysts, in addition to their other duties, develop all necessary documentation.

Several changes in the MIS environment are creating a trend toward option B, where the systems staff and technical writer are peers working together closely through the development process.

Change number one is the growing decentralization of data processing environments. Projects are now more user-driven. The technical writer, along with the applications/business analyst, is one of the prime liaisons between user and technician. Translating technical details to readable, concise instructions, the tech writer acts as the user vangard, the interpreter of a foreign language to business English.

"The user is getting more sophisticated," says writer Mary Ann Tharaldsen of Wells Fargo Bank in San Francisco. "He can do a little programming and understand the programmer better than before." Users have come to realize that systems are an important adjunct to the business environment, an adjunct they must control and understand and demystify.

Change number two is the emergence of hundreds of thousands of user computerphiles into the world of data processing through the microcomputer revolution. Armed with new knowledge about systems technology and the development process, the user expects more from documentation, based on his experience with manuals from popular micro packages. Dry technical prose isn't acceptable anymore. Graphics, tutorials, flowcharts, on-line help screens and quick reference cards are part of the new generation of documentation tools. They are

System 1032 for VAX

DBMS Bliss

Now there's software that users can use, programmers can program, and managers can manage.

Don't despair. If you've been frustrated waiting for ideal data management software, your worries are over.

The answer is System 1032™ DBMS for your VAX. And you can sample it at no risk or obligation. Here's the story.

Responsive Assistant

System 1032 provides a common-sense relational approach to data management, without the burden of relational calculus or SQL. Users easily grasp both simple and complex data relationships, and assistance is right at their fingertips. Special function keys make it easy to complete commands, quickly learn new ones, and see explanations of options and parameters, even in mid-command. So there's no need to struggle with a manual in the lap or consult an already-hassled wizard.

Best of all, System 1032 is fast and pretty. It answers complex queries almost instantly and produces presentation-quality reports with single commands.

Designer's Delight

Don't think it's a toy, though. Sophisticated applications designers can program in any VAX language, including System 1032's built-in block-structured language, and still access all of System 1032's powerful data management tools. A complete range of data types, format definitions, shared data structures, and other advanced features ensure that System 1032 easily satisfies the most demanding needs.

If you're a manager, you'll especially appreciate System 1032. Your users and programmers all use the same unified command language and data base concepts, so communication between them is easier than ever. And System 1032's careful human engineering drastically cuts your training costs and increases productivity.

Plus we exploit the best of the VAX architecture with shareable native code, asynchronous I/O, and proprietary inverted files—efficiently! So, unlike other software, System 1032 won't force you to buy more memory, disk space, or CPUs.

Risk Free

Software House has an impeccable decade-long reputation for reliable software and responsive technical support. System 1032 is the offspring of System 1022,® the most widely used DBMS for DEC mainframes. Its step-oriented commands and relational design have proved themselves in years of use at hundreds of sites. And System 1032 has undergone extensive field-testing to ensure that it works right the first time for you. Although new, System 1032 is already the most mature DBMS available for your VAX.

Convince yourself. Try System 1032 on your own VAX with your own data. A 60-day trial period costs just $85. Verify our claims, browse through our manual, and test our hot-line support service. Compare and benchmark System 1032 against other software, relational or not, at whatever price. Then sit back in bliss and watch your end users and programmers accomplish more, faster than you thought was possible.

So don't delay. Call us today, or send in the bliss coupon.

Introducing the TI 855 microprinter. No other printer says better so many ways.

Feature for feature, no other microprinter can match the versatility, compatibility, reliability and productivity of the OMNI 800* Model 855 microprinter. Here's why.

Two Printers In One. With the TI 855 you get the speed of dot matrix draft copy. Plus the precise clarity of the most advanced matrix technology for letter-quality print. It's two printers in one — at one low price.

A Great Family Name. Texas Instruments is known for providing the world with the industry standard for printers — the TI 810. TI builds the same reliability into every 800 series microprinter. Both the 855 and the data processing Model 850 are part of the expanding TI line of high-performance, low-cost microprinters.

Hardware Compatible. The TI 855 microprinter is compatible with all major PC hardware. And it provides both serial RS232C subset and "Centronics-type" parallel as standard interfaces.

Software Compatible. The TI 855 uses industry standard escape sequences for compatibility with virtually all third-party software. And for those with proprietary software needs, a model is available with ANSI standard escape sequences.

Tough Font Modules For Quick Character Change. Three font modules can be inserted into the front of the printer at one time, and are accessed individually. Each contains both draft- and letter-quality character sets. They're easier to use, more reliable and more durable than traditional metal or plastic daisy wheels.

More Productivity Than Any Other Microprinter. The 855 offers both friction and tractor paper feed, to handle all types of word and data processing applications. A quick-change snap-in cartridge ribbon. Raster and mosaic graphics. And intelligent printing which maximizes document throughput — regardless of format.

Get the printer that makes for better information systems. For more information visit your nearest TI authorized dealer or write Texas Instruments Incorporated, P.O. Box 402430, Dept. DPF-083OW Dallas, TX 75240. Or call toll-free: 1-800-527-3500.

contributing to clearer, simpler manuals and broadening the scope and importance of the tech writer's job.

On-line documentation

On-line documentation is a growing phenomenon. The costs for production and lack of flexibility of hard copy along with the cost for quick and frequent updating are two of the major reasons.

In one DP environment, user acceptance of on-line documentation was monitored closely. The results showed a strong trend in favor of the new approach. When the on-line screens were first introduced, the ratio of printed lines of documentation to viewed lines was 115 to 1. Within a year, that figure dropped to 45 to 1.

Changes in documentation can be written and released on-line in the same day. Special user interface programs are also becoming a part of the on-line documentation environment. Programs are available that adapt to the user's level of knowledge. The programs prompt the user to give enough information in the query to direct him to the proper section of documentation.

If the user is experienced and knows exactly what section of documentation to search for, a short query, properly worded, is sufficient.

Value of graphics

Whatever one's language skills, visuals are one of the most effective methods of conveying information. Consultant John Urton uses IBM's Script software as an aid in formatting and editing. "It helps me with information mapping, breaking down documentation into concepts and processes and procedures and generally smaller units."

Urton uses graphics enthusiastically and sets up sophisticated referencing through tabs and color coding. "Often all you need is the outline of a procedure, says writer trainer Carla Echols. "The graphic representation can be much more effective than prose." Echols claims writers are starting to do more flowcharting and less writing.

Logisticon, a systems house in the Silicon Valley, went a step beyond simple graphics for its documentation. It hired a cartoonist. Technical writer Dierdre Morgan worked with the artist to develop a manual that is entirely cartoons for a modular microcomputer-based warehousing and distribution package. Capitalizing on the use of flowcharts, diagrams and basic English, Morgan tailored the manual to speak simply and concisely to truck drivers working in warehouses, transporting merchandise from delivery docks to storage.

Artificial intelligence

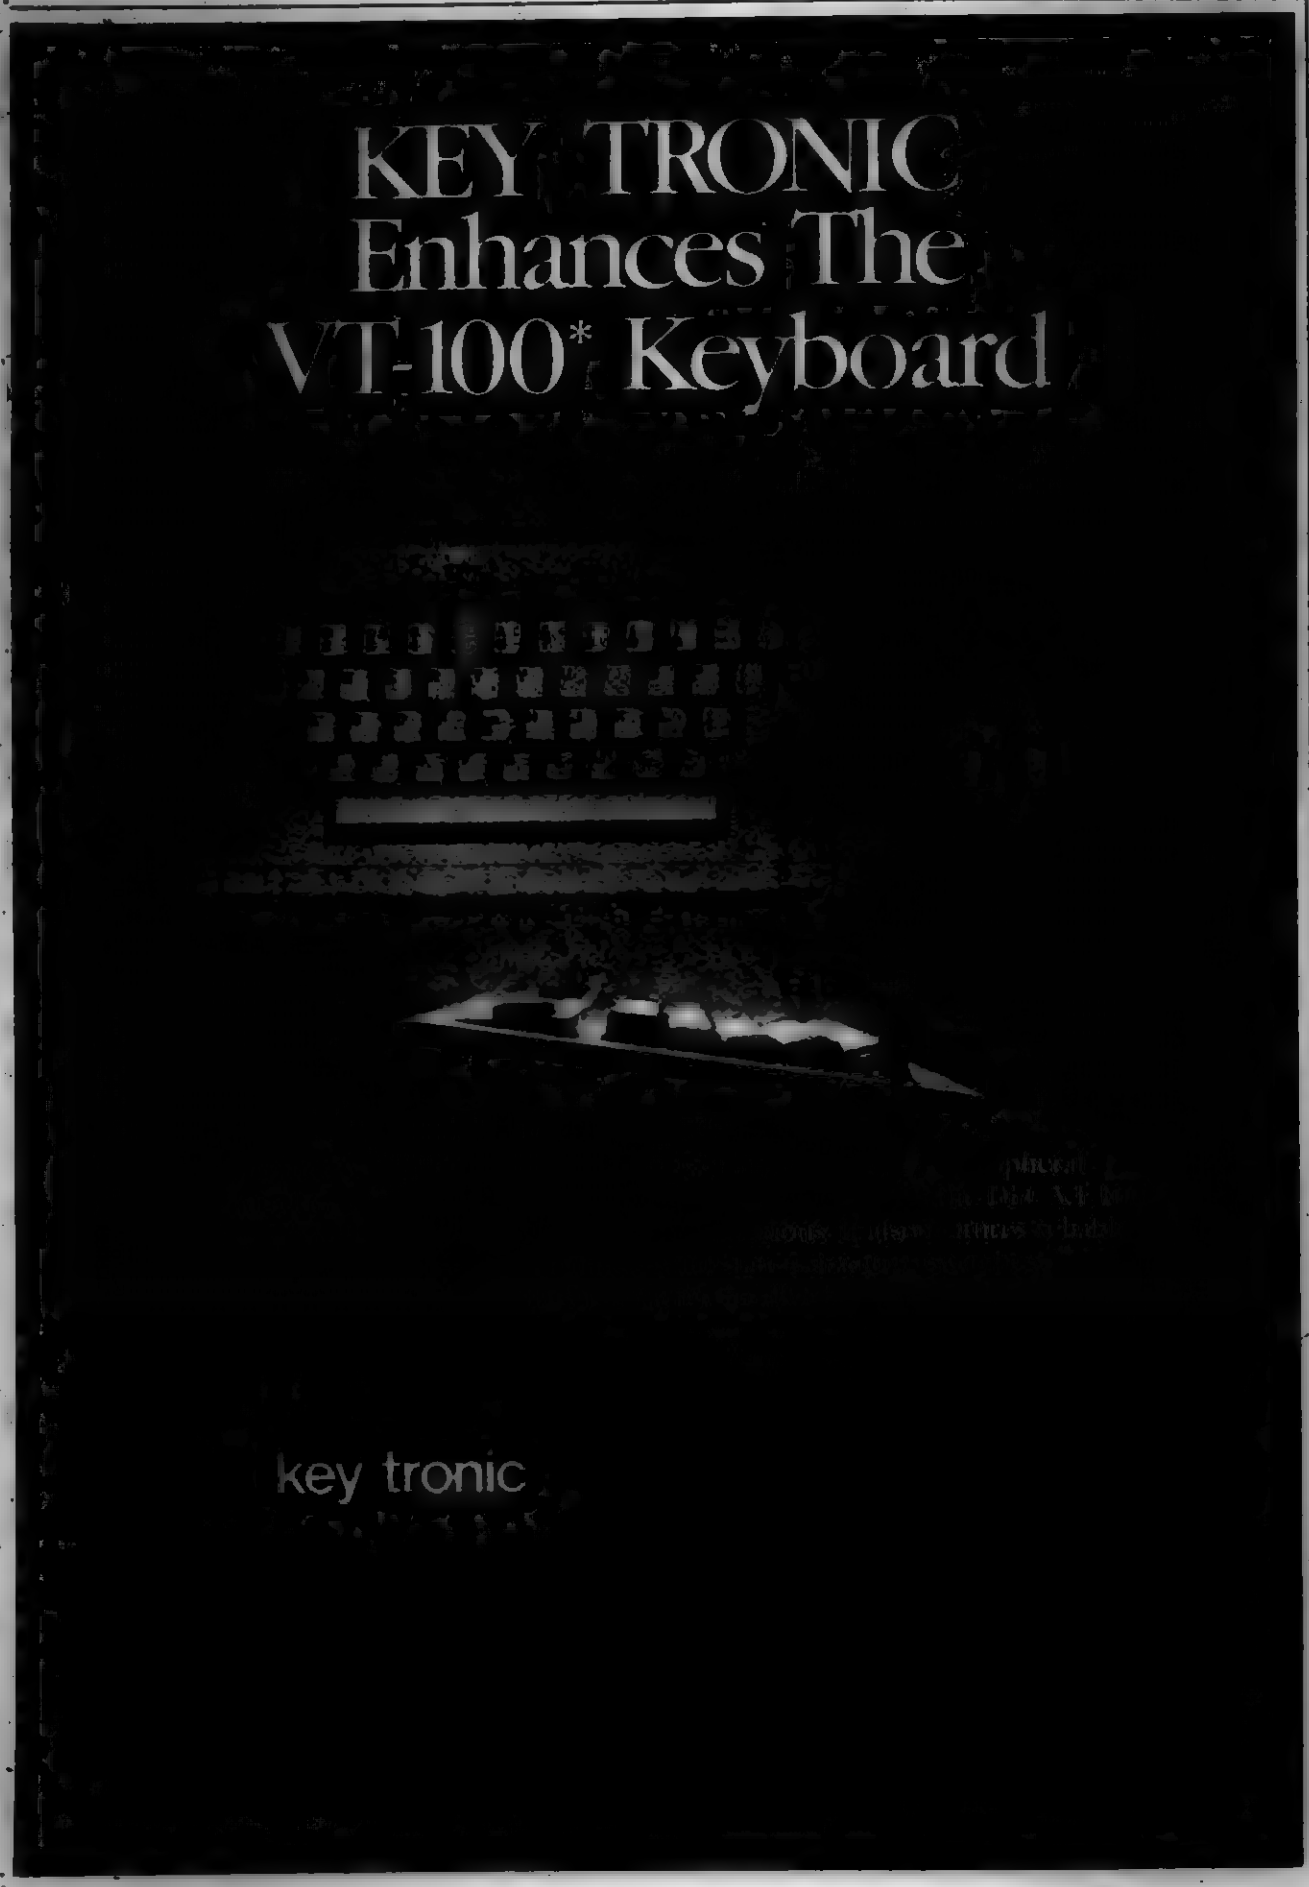
Even experimental "knowledge information processing" expert systems have affected the world of DP documentation. At the National Magnetic Fusion Energy Computer Center in Livermore, Calif., consultants are working on a sophisticated user interface for on-line documentation.

The center serves the country's magnetic fusion community — physicists and engineers at universities and corporations. But the documentation department confronts most of the same problems as its peers in financial MIS environments: interpreting and answering user queries, amending and implementing changes in documentation, extrapolating the hidden logic and functional sequence of a system from a technician's notes.

A team of consultants at the center is working on an experimental program that takes a user's on-line query, looks for terms in the question that might be key words in the documentation in question and then displays those passages of the documentation in which the key words appear. If there are no key words in the query, the program a) prompts the user to paraphrase the question until key words are produced or b) routes the query to a consultant's terminal at the center. In this case, the user would receive an answer or a referral to a specific passage of documentation, unaware that a human being was on the other end of the communications link.

Micro workstations

Other MIS environments are experimenting with using microcomputers as



1983 was a very good year.

NCR introduced more major data processing products than any other high tech company.

NCR closes out its first century with one of its most impressive technological achievements, the NCR 9300. It's the first full 32-bit VLSI mainframe designed for business applications. The 9300 delivers the power of a mainframe at the price of a mini.

New computers for 1983 included the UNIX™-based Tower, a microprocessor with the power of traditional minicomputers. NCR also added new multiprocessors to our top-of-the-line 8600 mainframe series.

We introduced the NCR Personal Computer specifically designed for the business/professional market. It provides dual processor capabilities to enhance performance, and is the first personal computer designed with networking in mind. It can function as an offline computer, an online terminal to your mainframe, or networked with other NCR Personal Computers and other popular PCs.

We strengthened our position as the world's leading supplier of retail point-of-sale terminals by introducing a wide range of new products. Included is a terminal that looks up the prices of over 14,800 items stored in its own internal bubble memory.

Our number one position in automated bank teller machines produced the technology for self-service airline, ski lift and service station terminals. We are the leader in electronic banking networks and electronic funds transfer.

Why did NCR introduce all these high technology products in 1983? We wanted to get a good start on our second hundred years. For more information, call 1-800-CALL-NCR. In Ohio, 1-800-543-4470.

And 1984 will be even better.

NCR

1884-1984
Celebrating the future

UNIX is a trademark of Bell Laboratories.

People Express, one of America's fastest-growing airlines, chose an NCR 8600 series computer system to handle online reservations. NCR is a leader in online transaction processing equipment, communications and system software.

The Tower microprocessor packs a lot of computer power in a 29" x 27" x 7" package. Up to 16 operators, local or remote, can access the Tower at one time.

Debit cards and Electronic Funds Transfer became a reality in 1983. NCR is the leader in EFT technology today!

Bubble memory technology provides resident mass memory in the terminal for automatic price look-up for supermarkets and other retail stores.

The new NCR Personal Computer offers unsurpassed monochrome or color graphics. Industry standards are used throughout so the applications programs you need are available now.

New drive-through ATMs help the world bank on the go. NCR helped pioneer the regional electronic banking network - and has installed more Automated Teller Machines worldwide than any other supplier.

The NCR 9300, a roomful of computer power in a 50-pound box, was a big breakthrough in 1983. Add this 32-bit VLSI mainframe for a complete system price of less than $48,000!

IMPROVE YOUR COMMUNICATIONS

WITH CECOM
MICRO & MAINFRAME
FILE SHARING

Now you can upload, download, and share files while maintaining data integrity and total system security. Supporting recognized 3270 emulation cards and protocol converters, the easy to install Tempus-Link runs under all recognized IBM software disciplines for the PC, the PC-XT, and mainframes while enhancing your communications by giving you complete interaction and integration with the micros in your organization.

For more information about the Tempus-Link, emulation cards, total system or network configurations, or equipment refurbishing, call or write:

We Communicate!

Dealer inquiries invited

workstations for tech writers. Lead Documentation Editor T.R. Girill of the Livermore center is managing the development of such a system.

"We're experimenting with a program that automatically splits the editing tasks between the micro and the mainframe. Global changes affecting the entire document are handled on the mainframe. Smaller, single-line or word changes take place on the micro."

According to Girill, the main file the writer is working on resides on the mainframe. Little pieces of the file are shipped, as needed, to the micro, a handy feature when editing among the 16,000 pages of on-line documentation that the center produces.

Another type of expert system the Livermore center is experimenting with involves the concept of a decision tree. According to Girill, the system is another type of query response mechanism that accesses a general subject or portion of documentation and then leads the user down a "tree" with alternatives, until the problem or user query is fully defined. The system ends by routing the user to that part of the documentation that answers the question.

Writing subspecialties

Evidence of the emergence of technical writing as a data processing specialty is in the proliferation of writing subspecialties and in the consulting positions they have spawned.

Documentation has established itself as one of the best liaisons between the technical and user worlds. As more users enter the world of data processing, their introduction to systems will be greatly influenced by the quality of systems documentation.

There are now methods analysts (who specialize in putting together standards and procedures manuals), indexers (they anticipate under what names a user might seek a bit of information in a manual, then set up the indexing and cross references), hardware and marketing and operations writers, to name just a few.

For the writer with several years of experience and an interest in consulting, rates currently range between $20 and $60 per hour. Hardware documentation, usually requiring an engineering or electrical background, may bring hourly consulting rates of $75 or more for qualified professionals. But the duration of consulting assignments for the tech writer is usually much shorter than for systems analysts and programmers.

This difference may account for the steady attrition from within documentation ranks. More money and greater responsibility lure tech writers to programming, analysis and management at rates of 50% to 75%, according to one recent survey.

At a salary in the range between $15,000 and $35,000, a technical writer can take his chances as a consultant (usually as an independent or subcontractor) or become an analyst, a technician or a manager.

Clearly, documentation has established itself as one of the best liaisons between the technical and user worlds. As more users enter the world of data processing, their introduction to systems will be greatly influenced by the quality of systems documentation. The clear-thinking, pragmatic, diplomatic and hard-working technical writer of today can look forward to a future with multiple opportunities within MIS.

About the Author

3270 Networking: No More No Man's LAN.

Imagine. 3270 Processing. IBM-Compatible Personal Computing. Local Area Networking. And SNA Compatibility. In One System.

Imagine a system that successfully settles the uncharted territory of 3270 local networking—that "no man's LAN" of unlinked and unrealized potential.

Imagine a system that delivers the power of 3270 processing, and the flexibility to build two local area networks from a single controller. Imagine being able to attach up to 120 devices to that controller. Or attaching four distinct controllers—and multiple coaxial links of up to 10,000 feet each—to any of those LANs.

Imagine the economies of a system that handles that networking with standard 3270 coax. That requires no commitment to special architectures or non-standard LAN technologies. And that, thanks to a multi-drop, station-to-station design, can eliminate thousands of feet of new coax.

Of course, such a system would have SNA compatibility. But it would also have a set of capabilities to dramatically increase throughput, while reducing hardware and support costs in *any* environment. Capabilities like multi-host and multi-personality support, application and address switching, and system printing.

This system would have multi-user personal computing "built into" the network—allowing you to assign true 16-bit computing power, maintain overall MIS control, and share expensive disks and printers.

Such a system would boast an intelligent display station that displays a mastery of ergonomic and aesthetic design. With multi-screen formats, anti-glare screen, low-profile keyboard, and a tilt-and-swivel pedestal with the smallest footprint in the industry. Such a system would also include a full line of printers.

Imagine. 3270 processing. IBM-compatible personal computing. Versatile, economical, powerful local area networking. In one system.

Braegen *has* imagined just such a system. They have designed it. Built it. And called it the ELAN™ System.

If such a system sparks your imagination, give us a call. We know the feeling. The Braegen Corporation, 525 Los Coches Street, Milpitas, CA 95035, (408) 945-8150; TWX: 910-338-7332.

Information systems — the power in your hands

By David G. Robinson

Businesses are coming to view their information systems as strategic weapons. With maturing products, intense overseas rivalry and increasingly fragmented and specialized markets, information systems can be powerful competitive tools when applied aggressively at the right time and in the right place.

Information systems are being used to strengthen communications with customers, analyze market trends and drive down operating costs by streamlining manufacturing and distribution facilities. While these applications sound familiar, the difference in the 1980s is the way in which companies are focusing their information systems efforts on those areas of the business that will yield the greatest competitive benefit.

Logically, this direction should result in new and challenging opportunities for the information systems organization. At last, the information systems function is putting its "beast in the basement" status behind it and becoming a real partner in managing the business.

Unfortunately, accomplishing this task is far from easy. Because of the way strategic systems operate within the business, traditional organizational structures and business/information systems relationships act as an impediment to the pursuit of strategic systems.

Supporting business changes

Business and information systems managers must first understand that information systems do not produce any strategic value at all. The systems themselves are, in fact, intrinsically worthless. The value that accrues from the use of information systems is a function of *business changes* that the systems support, not a function of the systems themselves.

Most strategic business moves involve some sort of change: in business process, in culture, in managerial approaches or in the marketplace. It is the strategic changes developed by management to respond to perceived opportunities or

Information systems cannot be strategic by themselves. They must be linked to corporate strategic thinking and become a vital part of the fundamental business changes which that thinking produces.

known competitive threats are the source of value when information systems are used strategically. Information systems operate to facilitate or make possible these fundamental strategic business changes.

Consider the following example. A large division of a manufacturing company determined that its inventory levels were excessively high, especially in its extensive distribution network. Corporate management had decided that working capital levels supporting the business had to be reduced or the business could not be maintained and would be considered as a candidate for divestiture. One of the major efforts management had initiated to combat this problem was an improved distribution system. Unfortunately, it was not until well into the systems effort that the fundamental *business* problem was identified: The company had adopted a customer service standard that resulted in excessive inventory levels.

For the past decade, information systems organizations have been taught, often painfully, that the key to success is to "serve the user." In reality, what the user wants is frequently inconsistent with the strategic direction of the corporation, especially in times of strategic change.

This basic business assumption had to be reviewed along with the other logistics and product movement processes that had been considered part of the system. The inventory problem became solvable only when the company began to rethink its entire distribution philosophy and adopted comprehensive alterations in its approach to servicing customers. After the problem had been reconsidered, the nature of the new distribution system also changed, and much of the original design work had to be scrapped.

The lesson here is that information systems cannot be strategic in and of themselves; they must be linked to a body of strategic thinking and be vital to the fundamental changes which that thinking produces.

Insiders or outsiders?

Many information systems managers would like to play a leading role in furthering strategic systems thinking in their organizations. For those who are already members of the senior management team, this desire is relatively easy to fulfill. Many other information systems managers are considered members of upper-level management as defined by their organizations, but they are often excluded from the "inside" discussions that surround the formulation of new business strategies.

In addition, most information systems organizations are managed to respond to requests from the operating level of the organization. This structure fundamentally limits the information systems department's ability to deal with strategic issues in the corporation. Communications between strategic managers and operating managers are often imperfect, especially at those times when strategic management is attempting to change the views of the bulk of operating managers in the corporation as part of a new strategic thrust. Yet these same operating managers largely determine what the information systems organization will provide for the corporation.

As a result, the information systems organization is commonly out of touch with strategic thinking in the company. Even when communication between information systems and the business is good, the former is still one step removed from strategic thinking. For the past decade, information systems organizations have been taught, often painfully, that the key to success is to "serve the user." In reality, what the user wants is frequently inconsistent with the strategic direction of the corporation, especially during times of strategic change.

Among our clients, we have seen the dilemma of the information systems manager lead to several undesirable results. First, we frequently encounter large, expensive and risky business efforts which, while responsive to the "bottom-up" requirements of the organization, are inconsistent with the "top-down" strategic view of the business. Second, because these tactical systems requests vastly outnumber strategic opportunities, the strategic systems opportunities are frequently lost in the shuffle.

Third, because operating managers are not usually positioned either to develop ideas for strategic change or to have the authority and responsibility to implement them, they are unable to work with the information systems organization to plan for strategic systems without the substantial involvement and backing of top management. That support is frequently lacking.

Finally, because this set of structures frequently results in the wrong systems being built, substantial amounts of information systems resources are being misapplied.

One company's experience shows what can happen when a strategic system is managed using conventional approaches. Senior management

$995
buys these fully integrated facilities for application development

METAFILE® is bursting with potential.

The METAFILE System gives users of IBM PCs, XTs or compatibles all the software they need to grow their own unique solutions to information management problems.

With the METAFILE System you can easily prepare text and create data bases, forms, menus and reports – and tie them all together, integrated. Either on the spur of the moment, or during the development of structured formal applications for others to use.

Unlike multi-function systems that force together a collection of software pieces, the METAFILE System is – from its very foundation – a single integrated architecture. One high-level language drives all its facilities. No need to learn (or teach others) a variety of inconsistent languages.

If your company has an Information Center, the METAFILE System helps meet your goals of faster application development, personal computer software standardization, and the training of users to design their own solutions.

The most appreciated advantage of your METAFILE System may be ease, or speed, or freedom. But the net result, in all cases, is higher productivity.

- Fourth-generation language, for higher productivity
- Data base management, giving you extensive capabilities
- Text management, with many word processing features
- Ad hoc inquiry, for on-line reporting
- Prompt-assisted commands, for easier use
- On-line documentation, to speed training
- Extensive debugging aids, for faster troubleshooting
- Report generation using single commands
- Display management using direct screen presentation
- Menu building for custom application interaction
- Forms generation for user-defined data entry
- Menu-driven assistant for easier use

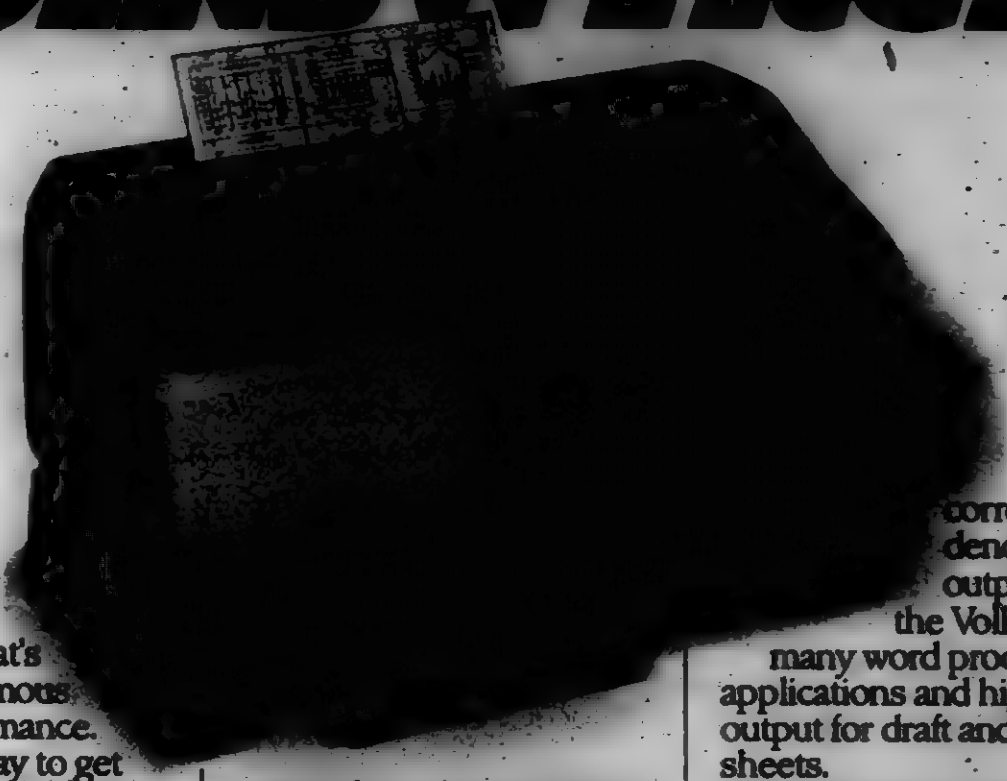
Integrated Information Management System

Soup up your Volkswriter.



Everybody knows Volkswriter, the word processing software package that's become synonymous with high performance. Now, there's a way to get even higher mileage out of your Volkswriter. Hook it up to a Dataproducts P Series dot matrix color printer.

The versatile P Series translates the executive class, word processing capabilities of the Volkswriter into brilliant full color charts, graphs and text. It delivers a full page of text quality print in nothing flat while its sheet feeder automatically prevents loading hassles. And the P Series uses pin feed or plain paper and has the brains to fill every appropriate line with crisp, sharp copy, even if it has to justify to do it. And the P Series color printer has dual speed capability for correspondence quality output for the Volkswriter's many word processing applications and high speed output for draft and spreadsheets.

The Dataproducts P Series color printer. Think of us as a supercharger for your Volkswriter.

For more information go to your nearest computer store and ask about the Dataproducts P Series color printer, or call Dataproducts, 1-800-258-1386.

Dataproducts computer printers

Nobody puts ideas on paper so many ways.

The quality of strategic communication between business managers and information systems managers can be substantially improved if systems managers attempt to couch every issue in basic business terms.

had identified improved marketing information as a strategic business issue and had chartered an internal task force to address and resolve the problem. Because the effort was regarded as a "data processing" project, it was delegated to a task force of managers two organization levels below the senior executive staff.

As the design effort progressed, the operating manager on the task force began to expand the scope of the effort and add additional demands, including a major overhaul of the order entry system. In time, each task force representative injected his area's system "needs" into the project. As the size and complexity of the system's functional specifications grew, new technologies were introduced into the design to support the increased level of functional sophistication.

The MIS group at the company felt that the user demands were too complex and that the technology to be used posed significant risks. The group was unable to alter the view of the task force, however, and had no clear process of appeal to senior management. Communications between the two groups broke down, and senior management was clearly troubled at the scale of investment involved, particularly when the value the system would add to the business was becoming increasingly unclear. After watching the project flounder for two years, senior management finally intervened and retained the services of an outside consultant.

The delays in the project resulted from the narrow technical debates which had overshadowed the underlying business assumptions used to assess potential benefits. Another problem was the "loading up" of the project with lower level needs not related to the project's original strategic purpose. By refocusing the project on the business benefits the system would support, the company discovered that many elements that yielded the most value to the business were the least complex technically and the least expensive.

When senior management was presented with these results, it rapidly authorized implementation of the high-payoff elements. The technical debate had continued for more than a year; implementing the high-value elements took less than three months. The original system plan would have cost more than $4 million over several years and carried a high risk of failure; the high-payoff elements cost less than $100,000 and provided immediate strategic benefit to the business.

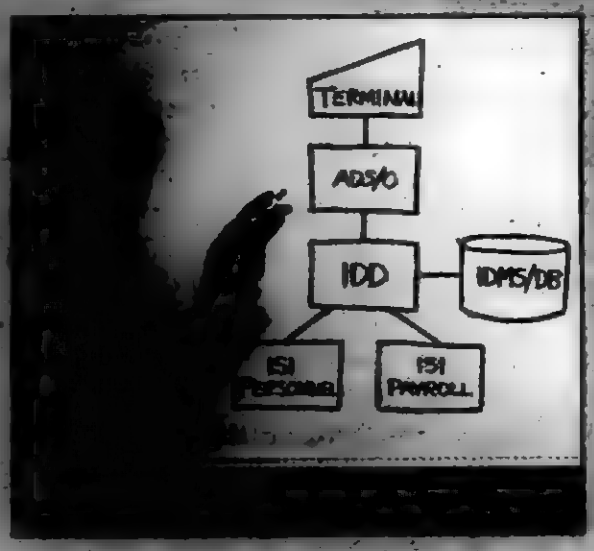
What can be done

Fortunately, there are actions that information systems managers can take to overcome obstacles and provide leadership in the pursuit of strategic systems for their organizations:

1. **Start talking in business terms.** Information systems managers have long had a tendency to favor a technical focus over a business focus in their discussions with management. Two factors contribute to this tendency. First, information systems managers are often excluded from many business discussions, especially those dealing with strategic business issues. As a result, they tend to retreat to their own turf, where their expertise is unchallenged. Second, the past five years have brought an explosion in the number of technical issues that must be mastered,

No waiting.
No kidding.

"Today we are installing the industry's only native IDMS Payroll/Personnel System using ADS/O".
Bob Tatum, ISI Vice President of Product Management



Finally. The one and only completely native IDMS human resource solution. All of the dialogues, screens, schemas and files reside on IDD. The entire on-line system has been developed using ADS/O exclusively. And there are no interface programs.

Now, you can receive it, just like Ford Motor Company, Harvard University, IBM-SEL, Fluor Engineers, Inc. and the City University of New York. And there are many more.

We have the industry's most advanced system architecture. We offer more on-line (real-time) payroll/personnel expertise than any other vendor. We deliver the best system documentation in the business. We're committed to customer service and we're ready and willing to be on-site to help clients with any aspect of their installation. In addition to IDMS, our products run under IMS, NATURAL/ADABAS, CICS/VSAM and others. We'll be glad to tell you more. Just call.

Setting the standards for excellence.

FIXED PRICE COMPUTING SERVICE

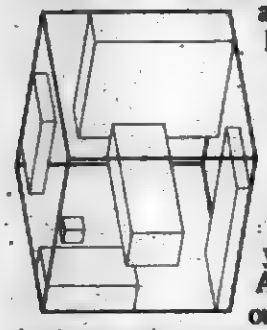
INTRODUCING SUBSCRIPTION SERVICE:

A Cost-Effective Alternative to Traditional Remote Computing Services or In-House Processing.

Now you can ***couple*** the benefits of a professionally managed remote computing service with the predictable cost associated with in-house processing. It's called Subscription Service, and it's available today from Martin Marietta Data Systems.

PREDICTABLE COST

Subscription Service is designed to keep your DP operation within budget. It curbs cost overruns by delivering a block of resources at an affordable ***fixed price*** — almost like the in-house machine.



But, unlike the in-house machine, your service doesn't degrade at peak-use periods, just when you need it most. And, when you're out of gas, you can upgrade easily. No lease payout. No hardware moves.

NO MYSTERY PRICING

Subscription Service unbundles the remote computing service offering to take the guesswork out of prices. Resource capacity and support levels are clearly defined and easy to understand. You buy what you need. Nothing more—nothing less.

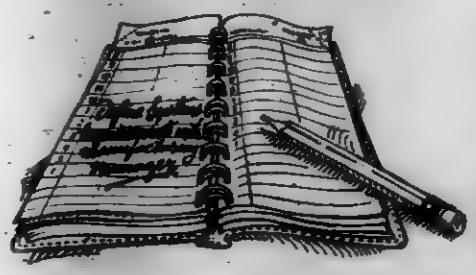
MORE TIME FOR YOUR USERS

It's a fact, a professionally managed computing service offers you ***freedom*** from day-to-day operational problems, giving you more time to focus on solutions to user problems. And, with an inventory of packaged solutions and productivity tools at your fingertips, the time and resource requirements to create a solution are greatly reduced.

COUPLE FREEDOM WITH AFFORDABILITY

Subscription Service is proof that you can get the best for less. All subscribers are linked to Martin Marietta's powerful host computers, providing the most up-to-date computing resources. You can depend on:

- ☐ Solid, stable, thoroughly-tested hardware, software and personnel
- ☐ Response time and throughput associated with IBM's fastest processors
- ☐ Access to hundreds of productivity tools and application systems
- ☐ Responsive technical consultants available around the clock



DISCOVER HOW SUBSCRIPTION SERVICE CAN WORK FOR YOU

If your budget for computer operations exceeds $20,000 per month for either remote computing service or in-house processing, then find out how much Subscription Service can save you. Or how much more service you can get for what you are currently spending. Or both! Simply return the attached coupon or call toll-free (800) 638-7080. In Maryland: (800) 492-7170.

Don't be undersold. Or sold a bundle. Get the precise level of resources you need with Martin Marietta's Subscription Service.

- ☐ Please send me your Remote Computing Services brochure.
- ☐ I'd like to have my subscription requirements sized. Have your representative call me.

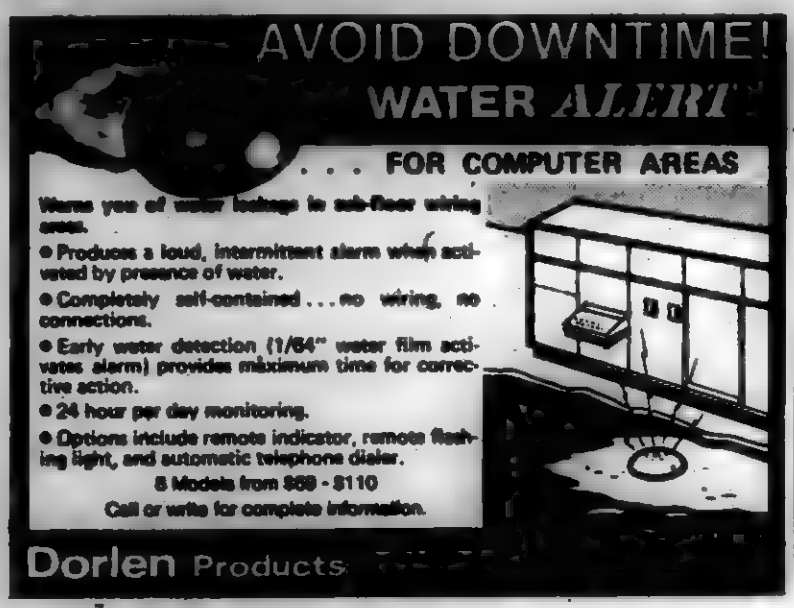
Martin Marietta Data Systems



raising anxiety levels about technical incompetence.

What is often overlooked is that some technical issues become irrelevant to a business if the basic business issues are clearly understood. The quality of strategic communication between business managers and information systems managers can be substantially improved if information systems managers attempt to couch every issue in basic business terms.

2. Strengthen formal strategic systems planning. Many information systems professionals have come to realize that the benefits of formal information systems planning lie in improving the quality of communications with upper management. But this avenue is only available if the information systems organization makes a concerted effort to develop a strategic plan — one that identifies those areas of the business where information systems can be used to strategic advantage and develops specific action programs to pursue those opportunities. This type of plan is the strongest means available to an information systems organization for forging the link between its activities and the strategic business plans of the organization.

3. Use communications opportunities wisely. Unfortunately, information systems organizations are not always given the freedom to develop a good strategic systems plan. Such a plan requires communication with management, and senior managers are sometimes uninterested in a strategic systems planning exercise. In these cases, there are still opportunities to begin exercising leadership in the right direction.

The annual information systems budget and its defense provide an excellent opportunity to present convincing, high-quality thinking about the relationship between information systems and the business.

Every information systems organization is required to submit an annual budget. This budget and its defense provide an excellent opportunity to present convincing, high-quality thinking about the relationship between information systems and the business.

In addition, some information systems organizations have found the production of an "Information Systems Annual Report" to be an effective starting point in restructuring communications with senior management.

Such a report lays out issues the information systems organization feels are critical for senior management to understand and can be written using internal information systems resources and then forwarded to senior management for review. While seldom solicited, this type of report has proven useful for several organizations in establishing a dialogue with senior management.

No longer can the information systems function operate simply as a passive service organization if strategic opportunities for the use of such systems are to be realized. The systems organization must forge a link with senior management so that its resources can be channeled into the strategic thrust of the business. Linking these two interests is often difficult, but it is vital.

About the Author

David G. Robinson is a vice-president of Index Systems, Inc., a consulting firm in Cambridge, Mass., that specializes in the management of information technology. Robinson is responsible for the firm's strategic systems planning services. As a specialist in the planning and management of information systems in large organizations, he has consulted to manufacturing, transportation, financial and government groups.

Lease a Magnuson PCM from Phoenix Leasing and get guaranteed support.

One of the best buys in plug compatible mainframes just got better. Now, when you lease a Magnuson M80 system from Phoenix Leasing, you get guaranteed support for as long as you have the system. **Get more power for the dollar.** With more processing power for the dollar, the Magnuson M80 is the most cost-effective alternative to IBM's 4300 series. And now, with guaranteed support from Phoenix Leasing, you can count on cost savings for years to come. **Complete systems, immediate delivery.** Phoenix Leasing has Magnuson systems in inventory ready for immediate delivery. And we can provide a complete system, including peripherals, all in one lease package. **Complete support guaranteed.** Now you can lease a Magnuson with confidence, because Phoenix Leasing guarantees support. Service is available nationwide, so you can be sure of receiving prompt service no matter where you are in the country. ☐ Here's how our service guarantee works: If we ever fail to provide you with satisfactory support, you are under no further obligation to keep the system. It's as simple as that. **Flexible terms make it easy.** We'll help you acquire the computer system you need by designing a lease that fits your requirements. We'll work with you to come up with the length of term, payment schedule, and buyout options that work best for you. **Backed by a company that knows what it's doing.** We've been in the business of leasing data processing equipment for more than 11 years, and we have acquired more than $500 million worth of equipment, including more than 100 Magnuson systems. We currently have over 6000 leases helping companies meet their data processing needs. **Call Kirby Fiegel today.** Don't miss out on one of the best computer bargains that will ever come along. Call Kirby Fiegel at (800) 227-2626 today. (In California, call 800-772-4021.) Find out how you can take advantage of this outstanding opportunity.

IN DEPTH

Illustration by Kinsie VanValkenburgh

Where information power can change your company

By Gregory L. Parsons

Significant advances in the related technologies of computers, telecommunications, data access and storage devices, graphics equipment and software have created a spectrum of opportunities for managers. The speed, cost, size and capabilities of the new information technology continue to improve rapidly, and there appear to be unlimited applications that could be "computer enhanced."

However, in spite of this new wealth of technological advances, the ability of most businesses to assimilate and apply information technology lags far behind the available opportunities. Although many authors have noted this shortfall over the years, the effect in the 1980s of this "strategic gap" is much more critical. Senior executives increasingly feel that their businesses should receive more benefit from technology investment, but few are able to articulate the impact information technology has or should have on their businesses.

The Executive's View

In a recent study, three senior executives not directly involved in the technology were asked to assess the impact of information technology on their businesses; their responses were quite different. A divisional president of a large industrial corporation said: "I think information technology contributes at least 3% of our bottom-line profit margins. Operationally, we couldn't get through the week without the system support, and in the marketplace, I don't think we could hold our market share without the technology. But this is mainly a gut feeling; I can't back up these estimates with numbers or specific reasons."

The chief strategist for a major U.S. bank said: "The technology is our top strategic concern, not because it outweighs everything else, but because we are unsure what to do with it. Although we have a strategy for the marketplace, the technology issues seem to be eluding

Information technology can fundamentally change whole industries by altering product life cycles or speeding distribution. It can create new business rivals, new consumer demands, new profits. How are you putting information technology to work in your company?

(Reprinted from "Information Technology: A New Competitive Weapon," by Gregory L. Parsons, Sloan Management Review, Vol. 25, No. 1, pp. 3-14, by permission of the publisher. Copyright © 1983 by the Sloan Management Review Association. All rights reserved.)

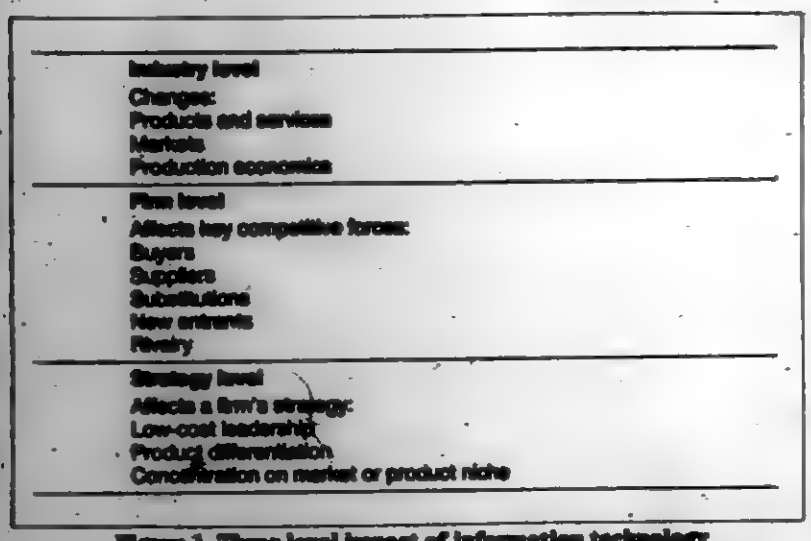

Figure 1. Three-level impact of information technology

us. On the one hand, it's important — everybody agrees on that, but then we end up doing projects based on a series of piecemeal technical decisions. We can't seem to grasp the bigger picture."

The chief financial officer of a large consumer goods manufacturing company explained his view of information technology: "We've really cleaned up our data processing act since the mid-1970s. The systems run well and now we're mainly fine-tuning. I expect we'll be doing primarily maintenance programming in the foreseeable future. I feel that we've gotten most of the benefits from the technology currently available. As the cost comes down, more projects will be financially justified, and then we'll do them."

From these remarks and the comments of many other senior executives questioned about information technology, two issues are clear. First, the importance of the technology varies widely from firm to firm. In some, it is a top-level strategic concern; in others, it is basically perceived as an administrative convenience. Second, there are no commonly accepted guidelines or framework for measuring the importance of information technology to a business. Most planning approaches do not take into account the strategic relevance of the technology. Although executives claim a "feeling" about the technology's importance, few could explain why it was so important. Even fewer could articulate how important information technology should be for the future.

Clearly, information technology is significantly affecting many firms and is now or will become a strategic concern for many over the next five years. It has been estimated that more than $1 trillion will be spent on information technology investments during that period. Figure 1 presents a three-level framework to help senior managers assess the current and potential impact of information technology.

This framework was developed from a two-year study of more than a dozen companies. It is based on a recognition and analysis of the competitive environment and strategies of business and focuses on the opportunities for firms to use information technology to improve their competitive positions. In order for information technology to become a viable competitive weapon, senior management must understand how information technology may impact the competitive environment and strategy of the business.

Impact at industry level

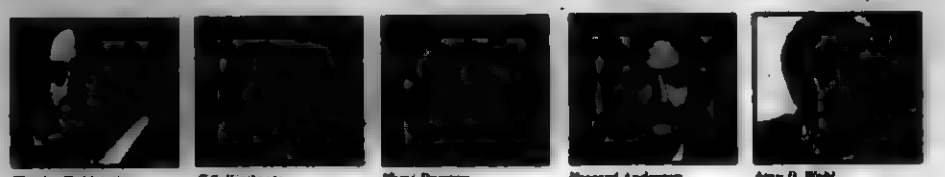
At the global level, information technology changes the fundamental nature of the industry in which the firm competes. When information technology changes an industry, it may affect the nature of the industry's products and services, the industry's markets and/or the industry's economics of production.

Products and services. In some industries, information technology may change the very nature of the industry's products and services: Information technology may substantially alter the product life cycle and significantly increase the speed of distribution.

For example, because of advances in information technology, the products and services of the publishing industry are undergoing significant changes. As the industry moves from a paper product to an electronically based one, the time and space constraints for product development and distribution are shortened. Authors and news sources are preparing electronic manuscripts and text, which are sent to publishers on floppy disks or directly from computer to computer. Electronic manuscripts are edited on word processors, typesetting is computerized and graphics are generated by computers. Promotional materials are distributed by telecommunications, and readers can buy the product from the publisher's electronic data base.

The time lag between an idea for a new product and its mass distribution could be virtually eliminated. Small publishers who can adopt the technology have substantially

COMMUNICATION NETWORKS '84
offers you 100 solutions
to your post-divestiture
telecommunication problems.



Charles Brownstein, Chairman, CBX, Continental Telecom, Inc. Keynote
F.S. Vigilante, AT&T Information Systems, Viewpoint
Mimi Dennis, F.C.C., Policy
Howard Anderson, The Yankee Group, Futures
Amy D. Wohl, Advanced Office Concepts, Micro Networks

As telecommunications and data processing managers, your success depends on keeping up to date with changing technologies. At COMMUNICATION NETWORKS you can choose from 100 information-packed sessions designed to help you succeed.

You'll learn how to survive the transition into the competitive telecommunications environment resulting from the AT&T divestiture. You'll discover new applications in Local Networks, Satellite, Bypass/DTS, Public and Private Data Networks, Interconnection, Micro Networking and new management technologies.

COMMUNICATION NETWORKS gives you twelve sessions focusing on "Network Technologies." Thursday, February 2, is "Microcomputer Networking Day," a full day devoted to teaching you how to get more from your PC than just stand-alone applications.

You may even choose to develop specific skills in one of the nine full-day "In-Depth" seminars. "In-Depth" seminars will be held on January 30, one day prior to the official opening of COMMUNICATION NETWORKS.

In just five years, COMMUNICATION NETWORKS has become the leading professional communications conference and exhibit in the nation. And COMMUNICATION NETWORKS '84 promises to be even better than ever—more sessions, more speakers, more exhibitors including American Satellite Co., AT&T Information Systems, COMSAT, Digital Equipment Corp., General DataComm Ind., General Electric Co., Integrated Communication Systems, General Electric Co., Microwave Link Operation, GTE Business Communications Systems, GTE Sprint Communications Corp., Harris Corp., DTS Div., Hewlett-Packard, M/A-COM, Mohawk Data Sciences, Northern Telecom, Inc., Scientific-Atlanta, Inc., Siecor Corp., 3M Business Communication Products, Ungermann-Bass, Inc., Uninet, United Technologies Communications Co. and many more offering the latest in products and services.

The DEC Rainbow 100+ The Rainbow 100+ system unit features Z80A and 8088 microprocessors, a 10 MB Winchester hard disk, a dual floppy diskette with 800 KB capacity and synchronous communications, built-in terminal emulator, printer port and 128 KB of system memory.

As an added plus for CN '84 attendees . . . you'll have a chance to win a DEC Rainbow 100+ Computer System.

COMMUNICATION NETWORKS '84, will take place at the Washington Convention Center in Washington, D.C., the telecomm capitol. It will be held on January 31 - February 2, 1984.

Call toll-free 800-225-4698 (in MA, 617-879-0700) for more information. Or fill out and return the coupon below.

reduced the product development cycle, gaining a significant advantage over large competitors.

Markets. Information technology can significantly change the markets of some industries. For example, financial companies will face a market of computer-literate consumers and businesses that will demand electronically based products and services. Information technology has already created a new product line called cash management systems, which are offered by large banks. As information technology erases traditional geographic market limitations, financial services companies must now compete in a global market. The emerging technology for automatic teller machines (ATMs), home banking and electronic funds transfer is making more sophisticated financial products and services possible and increasing the overall demand.

Production economics. Information technology developments may change the basic economics of production in some industries. In the distribution industry, information technology is dividing businesses into two categories: those that have computerized warehousing and inventory control and those that have manual operations. Businesses with computerized capabilities have the ability to serve a national market and are breaking the industry pattern of regional distribution. Such national distributors also enjoy other advantages, such as economies of scale in marketing, software and hardware. Because of control problems and high costs, businesses with manual operations are limited to local markets by their technological position.

Information technology will also affect the production economics in some industries by changing the industry's historical trade-off between standardization and flexibility. Some equipment manufacturing plants have already used information technology to achieve unit costs that remain essentially constant, whether one unit or one million units are produced. This new potential will effectively remove many of the traditional competitive advantages in these industries.

Information technology will reduce historical economies of scale in some areas while extending them in others. Because of the monitoring, controlling and coordinating potential of the technology, larger and more efficient facilities can be built which will capture new economies of scale by utilizing machinery, space, energy and specialized labor more efficiently.

There are critical implications for firms that compete in industries in which information technologies are changing the nature of the business. Traditional rules of competition will change, new economies of scale will evolve and entry barriers will erode in one area and spring up in others. There will be new competitors, new products and services, new distribution channels and different levels of demand and elasticity. Product life cycles will be shortened, and the value-added stream of the industry will be redistributed.

Before management can consider the long-run impact information technology will have within the firm, it must understand how information technology is changing the industry. This effort is entirely consistent with most views of corporate strategy, which begin with an understanding of the external environment of the firm. At the industry level, the impact of information technology ranges from major (in the banking industry, for example) to minor (as in the aluminum industry).

strategic needs of the firm, management must anticipate the impact of information technology at the industry level before it occurs so that strategies can be developed to position the firm appropriately in the new industry setting. For example, given the current rate of development in telecommunications and office technology, videoconferencing may become a major substitute for some business air travel in less than 10 years. This change would significantly affect the airline industry's business travel market. Today's chief executive officer and strategist must address a crucial question: What impact will information technology have on our industry over the next five to 10 years in terms of products and services, markets and production economics?

Impact at firm level

The impact of information technology is determined by the specific competitive forces facing the firm. M. E. Porter, in *Competitive Strategy*, described five forces that form the industry structure and the competitive "arena" for each firm in the industry. These five forces are the buyers, the suppliers, the substitutes, the new entrants and the rivals within a particular industry. Each firm in every industry faces these five generic forces; the specific manifestations of these forces determine a firm's profitability and range of potentially successful strategies. This framework for competition provides a useful vocabulary for defining the key issues facing a firm today and in the future.

Competitive forces

As information technology affects the products, services or operations of a business, it may change the relationship between an industry and its suppliers. For example, the use of sophisticated quality control systems by the auto industry is forcing steel producers to become much more quality conscious. This matter is even addressed in contracts, and it will change the mix of suppliers. As industries become much more dependent upon information technology, the supplier will become an important force for a firm to consider when planning strategy.

The technology will also change the level of sophistication of some industries' suppliers. Suppliers of funds to financial institutions are increasingly sophisticated (and consequently more powerful) because information technology allows them to monitor and redeploy investments with astonishing ease. Competitively, firms in industries in which information technology is affecting the supplier relationship must be concerned with how this change will affect a supplier's power in dealing with the industry.

Information technology will also affect the buyer relationships of industries as new products, services and distribution channels evolve. Buyers in the banking industry can now choose products and services from a variety of channels. The buyer/industry relationship has been fundamentally changed by ATMs, point-of-sale (POS) terminals and electronic home banking. Information technology has also altered the product mix of industries as firms have packaged information around a basic service. For example, a large distribution company has enhanced its distribution service by offering retail customers computer-generated inventory management reports on a fee-for-service basis.

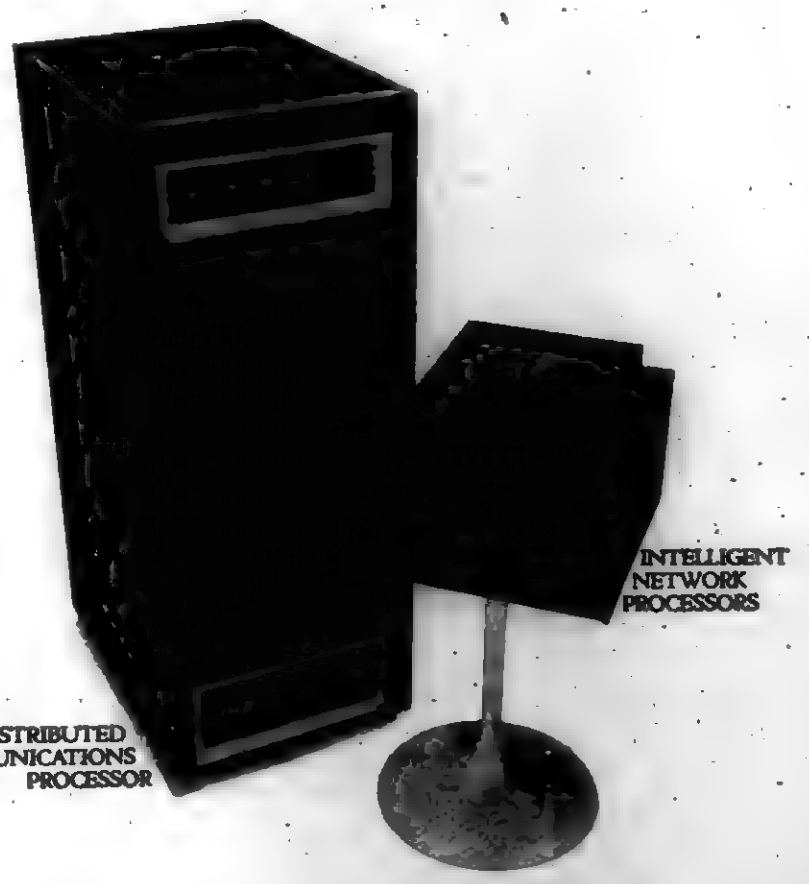
Information technology also affects the rate of substitution in some industries. For example, a large overnight carrier has recognized that electronic mail may substantially substitute for paper-based communications and is developing an electronically based business. Information technology will speed up the life cycle of many products by shortening the development process through computer-aided design (CAD) and computer-aided engineering (CAE). Firms that succeed by duplicating products at low cost will respond to product innovators much more rapidly and accelerate the substitution process.

Information technology affects the rate of new entry into industries by negating existing entry barriers or creating new ones. For example, in the banking industry, information technology-based access to banking services has seriously eroded the traditional entry barriers enjoyed by many branch offices. In the distribution industry, information technology has created new entry barriers by requiring investment in extensive computer and telecommunications networks that are used to control costs in large-scale multilocation distribution facilities. In effect, information technology has created a new scale-economy barrier that the new entrant must overcome in order to price competitively and still be profitable.

Finally, information technology

Each firm in every industry faces five generic forces: buyers, suppliers, substitutes, new entrants and rivals. The specific manifestations of these forces determine a firm's profitability and range of potentially successful strategies.

OH WHAT A YOU WEAVE.



changes industry structure by affecting the rivalry bases among intra-industry competitors. By introducing a new competitive weapon into various settings, information technology sparks outbreaks of firm warfare. Recently, American Airlines and United Airlines have used their reservation systems to competitive advantage by listing their own flights ahead of competitors' flights (termed "systems bias") and by negatively promoting competitors' flights.

Certain securities brokerage firms have exploited information technology to introduce a radical form of cost competition through the telecommunications and computer-based discount brokerage. In the banking industry, leading banks see smaller competitors joining forces through shared ATM networks. Clearly, information technology will contribute significantly to rivalry in many industries in a number of as yet unknown ways.

By introducing a new competitive weapon into various settings, information technology sparks outbreaks of firm warfare. Recently, American Airlines and United Airlines have used their reservation systems to competitive advantage by listing their own flights ahead of competitors' flights (termed "systems bias") and by negatively promoting competitors' flights.

Because the competitive forces of buyers, suppliers, substitution, new entrants and rivalry can significantly affect a firm, managing information technology is a vital element of a firm's strategy and part of its competitive domain. Although information technology represents a challenge or threat to a firm's established ways of doing business, it also represents opportunities for gaining new competitive advantages. Information technology resources can be used as competitive weapons to improve a firm's position in its competitive environment.

Creating competitive advantages

Buying power. The buyer groups of an industry represent a force which, if strong, can reduce the profitability of an industry. For example, strong buyer power exists if customer groups are very concentrated or if they purchase large volumes relative to the industry's total sales. When a handful of buyers represents an industry's entire market, then the importance of each buyer to each selling competitor is so great that concessions are a way of life for the industry and potential profits are reduced. Buyers also have significant power if the cost of changing suppliers or changing to a substitute product is low. The lack of "switching costs" between an industry and its buyers can result in reduced profitability.

There are two ways in which information technology can be a strategic weapon for reducing buyer power. First, it can introduce switching costs, making it more costly for a buyer to change suppliers. Information technology has greatly increased the ability of many firms to raise switching costs for buyers. For example, a large medical supply company has provided on-line order entry terminals and inventory management software for customers. As the customers' systems are integrated with the supplier's, it becomes much more difficult for customers to order from a competitor. If customers change suppliers, they incur testing and implementation costs as well as the cost of retraining personnel and developing new procedures. The more sophisticated the systems, the greater the switching costs and the less power buyers have to indiscriminately switch to a competitor.

Second, information technology represents a strategic weapon for dealing with powerful buyers by providing the capability for firms to develop buyer information systems that determine the profit potential of various buyer groups. All industries have certain customers who are extremely expensive to service relative to the average customer. In addition, some firms are particularly well suited to service some customer groups but not others. However, it is usually very difficult for a manager to determine the overall attractiveness of a current or potential market segment to the business.

For example, because of the insurance industry's historical tradition of providing full service to all business customers, there has been no attempt to match products to customer segments in order to maximize profit. Consequently, although they have a wealth of data, most insurance companies have poor information to answer such crucial questions as: How much does it cost to service a particular market segment? How should our customer portfolio be pared to fit our particular capabilities?

To address these critical issues, a large insurance firm is building an extensive claims data base to go beyond actuarial calculations in an attempt to determine which potential markets will be most profitable. As the overall cost of servicing

TANGLED WEB

When first you practiced to send and receive, it was simple. One data source. One data destination.

But as your networks grew, they grew more complex. More fragmented. More dispersed. More out of control.

Something had to be done, and Codex did it. With 6000 Series Intelligent Network Processors.

These statistical multiplexers help you unify a fragmented data network, consolidate data paths, gain more management control and cut line and equipment costs.

At the same time they give you error-free transmission, greater throughput, increased uptime, maximum flexibility and one point of control easily monitored and managed.

With the Codex 6000 Series, this level of control is possible in any network. With any kind of computer. With any mix of synchronous and asynchronous terminals. Here or overseas. And in more than 40 different protocols from IBM, Honeywell, Burroughs, DEC and more. Including support for X.25.

Codex can even unsnarl the process of choosing equipment and designing a network through the Codex Application Engineering program—the most comprehensive support service in the industry.

It all boils down to this: No matter how big and unmanageable your network has grown, there's a simple way to untangle it.

Codex.

insurance customers increases significantly because of deregulation and competition, buyer selection is a key issue, and the strategic application of information technology resources will provide a competitive advantage.

Supplier power. Strong supplier groups may reduce much of an industry's potential profits. The suppliers of an industry include the sources for raw materials, machinery, capital and labor. Suppliers will be powerful if they are very concentrated or if the buyer faces very high costs to obtain information, to shop or to negotiate.

The lack of comprehensive information systems to monitor and evaluate a bank's current and future money position represents a severe strategic disadvantage in dealing with the major supplier — the financial markets. Information technology is a critical tool to help the banking industry respond effectively to fluctuations in these markets.

Information technology represents a strategic opportunity for a firm when the technology can be used to mitigate the factors driving the power of suppliers, thus improving the firm's competitive position. For example, information technology can be used as a viable alternative to high-priced labor. Recent developments in robotics and computer-aided manufacturing not only reduce the cost of labor outright, but they also reduce labor's power to demand industry profits. A manufacturing company recently installed a real-time labor efficiency management system that is tied directly to the wage incentive system specified in the union contract. The owner of the business feels that this system has provided a significant advantage in dealing with his labor force.

Information technology can also be used to avoid high switching costs. One of the major problems facing the banking industry is its inability to manage strategically its largest single cost — the cost of money. The sources of funds for a bank include customer deposits, money markets and certificates of deposit. The interaction of various interest rates for these sources creates a complex problem for bank management, especially during times of extreme interest rate volatility. The lack of comprehensive information systems to monitor and evaluate a bank's current and future money position represents a severe strategic disadvantage in dealing with the major supplier — the financial markets.

Information technology is a critical tool to help the banking industry respond more effectively to fluctuations in these markets. Currently, the lack of strategic information technology severely limits the ability of many banks to gather, process and decide on optimal funds sourcing quickly.

Because of historical and economic conditions, many industries are subject to intense supplier power. Although some of this power is uncontrollable, the strategic application of information technology often represents a potential competitive advantage.

Substitution. The existence of cost-effective substitutes for a product (for example, margarine for butter) may limit potential profitability in an industry. In some instances, a substitute product can virtually eliminate an industry, as happened when the silicon chip-based calculator replaced the electro-mechanical adding machine. An industry must recognize that both existing and potential substitutes will affect the overall demand for products and the profitability that will result from serving the remaining demand.

This reduced profitability results from price competition with substitutes, the cost of advertising against substitutes and product innovation directed at substitutes. However, substitution also represents an opportunity for a firm within an industry to increase its own market by offering its products as substitutes to another industry's buyers.

Information technology becomes a potential strategic factor in dealing with the competitive force of substitution when information technology affects the buyer's decision to substitute or not. This decision is affected by altering the relative price performance comparison with the substitute by lowering cost or improving the perceived performance and by increasing or decreasing the range of functions performed by a product.

One example of substitution based on information technology involves a large brokerage firm that developed a new financial product to support a range of product features through a sophisticated information system. Although the product features existed separately in other products, the combination of features and easy customer use made this product an effective substitute for many existing products in spite of the price premium. This product has been extremely successful and now has a host of imitators.

New entrants. For existing competitors, new entrants present a concern because they will extract some of the industry's profits. For example, increased competition can be touched off by new entrants who use price-cutting tactics to gain market

FOR THREE DAYS IN TEXAS WILL TURN

No single computer, personal or otherwise, has so profoundly affected all of business and industry as the IBM Personal Computer.

And now, for three days only, you can see, touch, use and compare the hardware, software, peripherals and compatibles that run on, like or with this revolutionary machine. It's the PC *World Exposition* in Houston, and you are invited to join us.

You'll see hundreds of exhibits from all the product leaders. Both makers and marketers of hardware, software, printers, peripherals, add-ons and services in a giant exhibition and retail selling event. Here's a list of some of the product leaders you'll see:

penetration, which occurred when the Japanese entered the U.S. automobile industry market. Unless industry demand grows fast enough to accommodate the number of new entrants, average profitability will decline.

Entry barriers are the major structural components of an industry that slow or exclude new entrants. Although entry barriers take many forms, sizes and shapes, they all create a more favorable situation for an existing industry participant than for a potential entrant.

This better situation may be based on costs, reputation, service, technology or some other characteristic important to success in the industry. Entry deterrents are tactics or processes that an industry or a firm can employ to make a potential entrant reconsider his entry. Such actions as deep price cutting during a new entrant's test marketing can act as a deterrent by emphasizing the industry incumbent's relative cost advantage over the potential entrant, and it can also confuse the test market results.

Information technology can be used as a strategic element to deal with new entrants, both offensively and defensively. An insurance company has continually led the industry by building and maintaining a large on-line telecommunications network to its agents. As increasingly sophisticated insurance products are rapidly introduced, this network will continue to grow as an entry barrier.

Entry barriers and deterrents are key aspects of an industry's continued success. Without continual maintenance of the barriers, new entrants will sneak into the industry, usually at the most profitable segments of the market. A firm's strategy must also take into account entry barriers, because a new entrant will often target a vulnerable competitor. Industry leaders are particularly responsible for maintaining entry barriers and creating deterrents.

A firm that contemplates entering a new industry must consider the entry barriers to be overcome and any potential retaliatory action by the violated industry. There are a number of ways to penetrate a new industry, including undertaking joint ventures and acquisitions, focusing on a nonthreatening industry niche or developing new technology that circumvents historical barriers.

Information technology can be used as a strategic element to deal with new entrants, both offensively and defensively. For example, a major insurance company has continually led the industry by building and maintaining a large on-line telecommunications network to its agents. As new, increasingly sophisticated insurance products are rapidly introduced, this network will continue to grow as an entry barrier. Agents must now have much more on-line support, training and promotional backup, and this network provides that support. Without such support, a new entrant will not be an effective competitor.

Another example involves a large financial service company that has built a reputation of quality service and that offers the greatest geographical coverage of any competitor. The company's quality of service and ability to serve a worldwide customer base are built upon information technology capabilities, which represent a capital barrier and which support a reputation barrier.

Information technology will also be used by industrial firms trying to achieve new manufacturing economies of scale relative to competitors, new entrants and substitutes. The potential of these firms to gain scale economies using information technology will depend upon the possibility of going beyond stand-alone applications (which have been the predominant industrial use of information technology).

To develop new scale economies, information technology must be viewed as an organizing concept to use when redesigning the manufacturing process. New economies of scale will only be achieved by identifying the strategic impact of information technology and deploying information technology resources to achieve the desired competitive effect.

Rivalry. Industry rivalry can vary from very intense "guerilla warfare" to a very relaxed "country club" approach. Very intense rivalry depletes the industry of some potential profits, because actions detrimental to the entire industry may occur as competitors struggle to the death for an advantage. The airline industry provides a good example. Because of intense rivalry, airline companies are price cutting far below their real costs. Although one competitor may eventually win, the entire industry is losing.

Dealing with competitors strategically does not always mean destroying them. To operate effectively over time, most industries require a group of good competitors. Having proper competitors allows a firm to earn more profits, develop more new

FEBRUARY, ALL EYES IN TO THE IBM PC.

Plus, we'll present personal computer experts from around the nation in an up-to-the-minute conference program. You'll learn how to choose and how to use the technology and equipment surrounding the PC family of microcomputers. Here's a partial listing of the conference sessions:

Wednesday, February 1, 1984
User Sessions:
The Benefits of the IBM PC for Small Businesses
Financing Options and Tax Advantages
Available Add-Ons and Peripherals
Software: What's Available and How to Find It
What Do the Compatibles Have To Offer?
How I Became Compatible With My IBM PC
Medical/Dental Applications for the PC
The PC in the Law Office
PC's and Real Estate
Manufacturing Resource Planning with the PC
Investment Software for the PC
CPA Software: The Bottom Line
Software for Insurance Applications
Distributed Control Software for the PC

Thursday, February 2, 1984
User Sessions:
The Anatomy of the IBM PC
Defining Levels of Compatibility Between Systems
Overview of Compatibles: Desktops and Portables
Word Processing Software
Database Management Software
Business Graphics Software
Analyzing Your Software Requirements
Overview of Major Business Applications Software
Integrated Software Solutions

Friday, February 3, 1984
User Sessions: The PC in the Corporate Environment
Review of Policy and Planning Issues
Implementation Strategies
Use of PC to Mainframe Communications (Includes Security Issues)
Local Networking for the PC

Quite simply, the PC *World Exposition* is the biggest event in Texas for the most important computer in history.
Don't miss it.

FREE ADMISSION to one Conference Session of your choice. Just present this coupon at the Registration Desk any day of the Show, pay the regular $10 exhibits only admission and choose any one Conference Session free of charge. One coupon per person.

The PC World Exposition
Houston
February 1-3, 1984, Astro Hall

SAVE $5.00 on Full Exhibit & Conference Admission. Present this coupon at the Registration Desk and pay just $25.00 for a Conference Pass entitling you to attend all Conference Sessions and three days of exhibits. One person per coupon.

IT'S WHAT THE WORLD IS COMING TO.

The PC *World Exposition* is produced by Mitch Hall Associates in cooperation with CW Communications, Inc., publishers of PC World, MICRO MARKETWORLD, InfoWorld, and Computerworld.

Three-day admission to all exhibits and conference sessions is $30.00. Admission to the exhibits only for three days is $10.00. Show hours run from 10:00 AM to 2:00 PM Wednesday and Thursday, February 1 and 2, and from 10:00 AM to 2:30 PM on Friday, February 3. Conference sessions run from 8:30 – 10:30 AM and 2:30 – 5:30 PM on all three days.
For attendee and conference information, call CW Communications at 1-800-225-4698.
For information on exhibiting, call Mitch Hall Associates at 1-617-239-7400.

markets and create better entry barriers than it could alone. For a firm to cope strategically with the competitive force of rivalry, management must identify when to compete, when to cooperate and how to do so effectively.

Information technology presents major opportunities for companies to affect the degree of rivalry and the methods used to deal with it. Firms can improve both their own competitive position and the entire industry by utilizing information technology-supported data, information technology distribution channels and potential information links within the industry. In the banking industry, information technology represents a tremendous strategic opportunity for individual firms to deal with increasingly intense rivalry.

For example, smaller rival banks may share a common group of ATMs against a market share leader. In the airline industry, shared reservation systems are a way to improve overall service to the consumer. In the railroad industry, standardized data and communications networks between firms offer a way to improve railroad transportation service. Other examples of cooperative information technology use by rivals include computer-to-computer connections, joint information technology ventures and shared software.

Since information technology presents a virtually unlimited opportunity to structure the relationship between a firm and its competitors, information technology should be a vital component of any strategy for dealing with rivals. The key, of course, is to know which information technology relationships should be cooperative and which should be competitive.

The five forces of buyer power, supplier power, substitution, new entrants and rivalry shape the competitive environment for each firm in an industry. These forces vary in the manner and degree to which they will affect each firm in the industry. As part of its strategic analysis, each firm must identify the specific competitive forces and underlying economics that determine the strength and stability of those forces.

The importance of information technology as a competitive resource can then be estimated by isolating where information technology can be used to alter a competitive balance or parry a competitive thrust. Although this may sometimes happen by accident, the analysis presented here provides a method of identifying the most likely opportunities, and it should, therefore, improve a firm's luck.

Impact on strategy

The industry setting not only determines the average profitability for a firm, but it also forms the competitive environment within which a firm's strategy must operate. Successful firms in an industry position themselves relative to industry forces by effectively implementing one or more generic strategies:

- Overall cost leadership on an industrywide basis.
- Differentiation of products and services on an industrywide basis.
- Concentration on a particular market or product niche.

Each of these strategies provides a general framework within which a firm sets functional policies and procedures and also performs activities that implement that strategy. If a firm executes one of these strategies successfully, it will enjoy an advantage relative to industry forces that will yield higher than average returns.

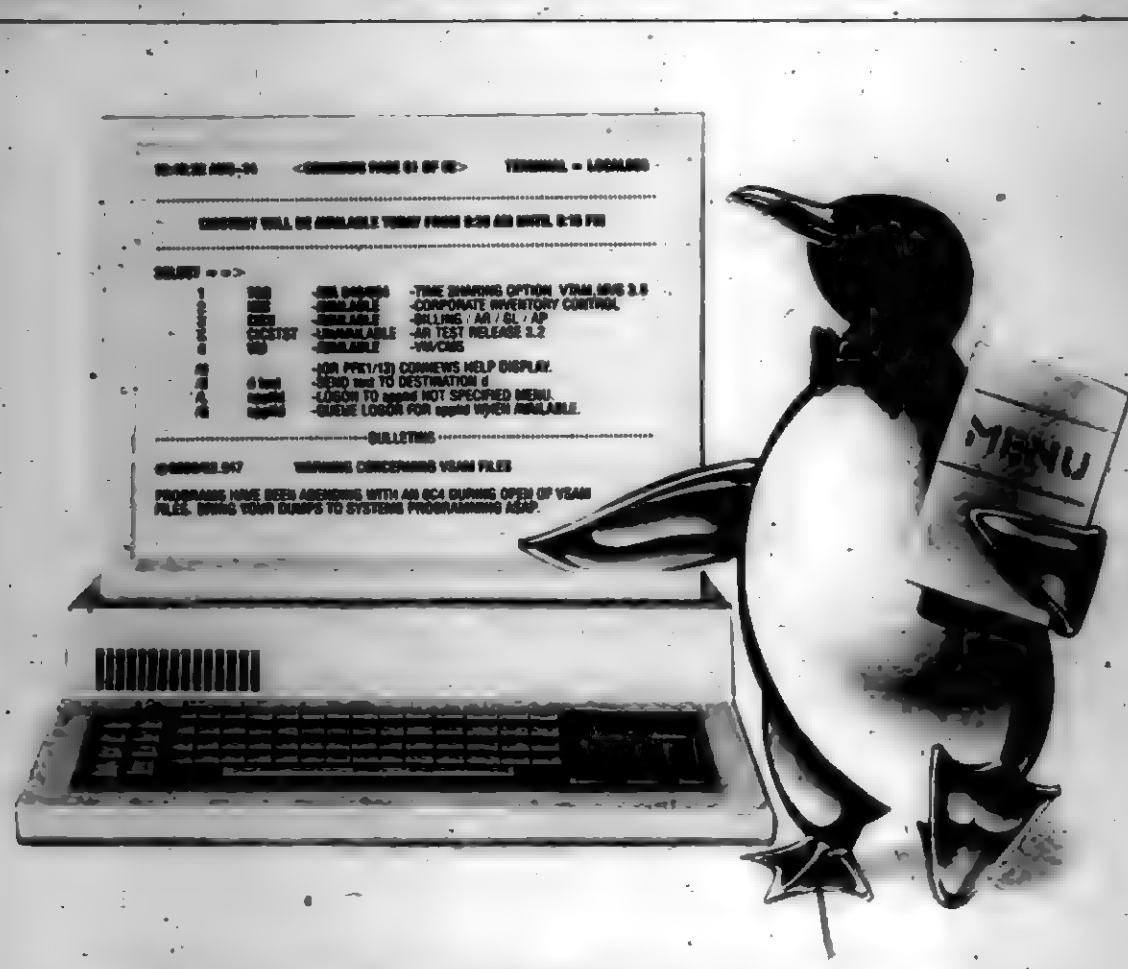
Information technology can affect the ability of firms to execute a particular generic strategy. For example, a large financial service company holds its cost leadership position in the industry because of a sophisticated application of information technology that substantially reduces the cost of transmitting and processing transactions. A manufacturing firm has distinguished its products by achieving levels of quality control and precision that competitors cannot match. The key to its advantage is a quality control information system and the heavy use of computerized machine tools, which provide much greater accuracy while tripling productivity.

Information technology can contribute to a generic strategy in a variety of ways, because the successful execution of such a strategy requires the broad support of all functional areas in a firm.

Information technology is utilized for experimentation support in research laboratories, for computer-aided design and engineering in engineering departments and for production control in factories. The technology is also used for market analysis and distribution support in marketing departments, as a sales tool in the field, for office recordkeeping and for planning in executive offices. In the long term, nearly all functions of all firms can be computer-enhanced to some degree. The strategic issue is: Given scarce resources of time, money and staff, which applications are most important to automate?

Supporting strategies

Clearly, a firm should use information technology to support, reinforce or enlarge its business strategy. In general, firms pursuing an overall cost leadership strategy should use information technology to reduce costs either by improving the productivity of labor or by improving the utilization of other resources, such as machinery and inventory. Firms following a differentiation



CONNEWS.™ THE APPLICATION MENU THAT GIVES YOU THE HOT NEWS AND THE COLD FACTS.

CONNEWS is the user-friendly ACF/VTAM software product that lets 3270 users select from a convenient application menu or view up-to-the-minute information from an electronic bulletin board. No systems modifications are required.

CONNEWS. It's the MENU that really satisfies your taste for applications, and installation NEWS. Some of the more desirable entrees include:

- Customized Company LOGO displays
- Individual MENUs for specific terminal groups
- Terminal ID permanently displayed
- Operator MODIFYable "HOT NEWS" area
- Availability status for menu entries
- 999 page electronic Bulletin Board
- Single or Multi Domain operation

If you want your menu to be easy-to-read, friendly, and highly flexible, CONNEWS is the one for you. Call us today to make a reservation for a FREE TRIAL.

cxi CXI, Inc., 10011 N. Foothill Blvd., Cupertino, CA 95014 (408) 725-1881

Every software ad you read seems to be talking about 'integrated software.' But it was 1-2-3™ from Lotus® that actually gave the phrase real meaning, because we combined spreadsheet, information management and graphic functions in one simple, powerful program.

A program that is faster and easier to use than any other software available today.

In short, the tasks it can perform are really impressive, but why it can perform them is even more important.

Because we feel the real criterion for any management tool is its ability to let the human mind flourish and accomplish more than it ever has before.

That's why with 1-2-3 the thought process is not interrupted, so your mind no longer has to wait for your hands. To the novice, it makes everything plausible. To the expert, it makes anything possible.

The results: Business decisions come faster and easier.

1-2-3 from Lotus is truly compatible with the most important personal computer of all—the human mind.

And isn't that what integration really should mean?

Call 1-800-343-5414 (In Massachusetts call 617-492-7870) and find out more about 1-2-3 from Lotus.

Lotus

The hardest working software in the world.

1-2-3 and Lotus are trademarks of Lotus Development Corporation. All rights reserved.

THE FIRST MOBILE COMPUTER.

THE COMPLETE COMPUTER FOR THE MOBILE PROFESSIONAL.

Professionals on the move in today's productivity-paced business environment have to run a little faster just to keep up.

They can easily spend half their time in airports, taxis, lobbies and hotels unable to do the work they'd like to get done.

But we have a solution.

Give them the powerful 9 pound, 16-bit computer that works when and where they do.

Give them an advanced battery-powered printer that attaches securely on the computer.

Give them an interactive human interface and operating environment that takes only 15-30 minutes to learn.

And unique field-oriented software that comes in rugged plug-in capsules.

In short, give them the Gavilan™ mobile computer.

PORTABLE TURNED PRACTICAL.

Never has there been a complete business computer system as sophisticated, yet as lightweight, as the Gavilan.

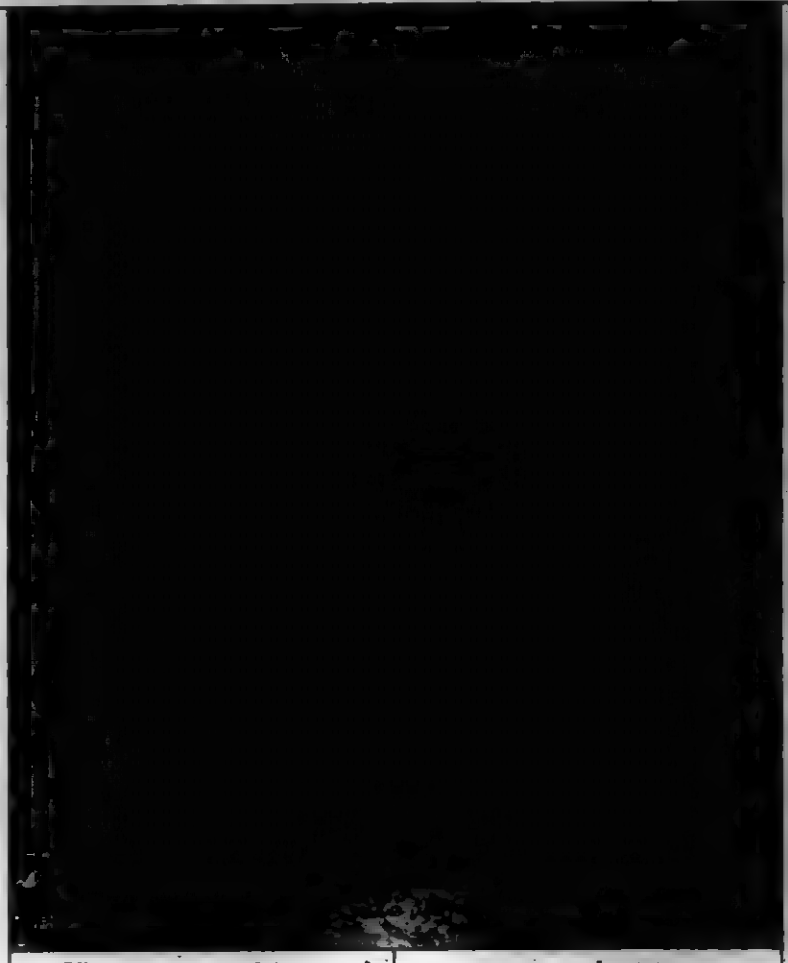
Self-contained, rechargeable 8-hour batteries free the user from external power constraints.

The 8 line X 80 character screen eliminates the need for an external monitor, although you can add one if you wish.

The full-size typewriter keyboard makes data entry as convenient as it is in desktop systems.

A built-in 3½" microfloppy disk drive and modem provide the capabilities of data handling and transmission where they never before existed.

And a 50 character per second printer gives the mobile professional in the field the immediacy of hard copy text, forms, charts, spreadsheets and graphics.



All in a compact 14 pound mobile office.

WE BUILT A MORE MOBILE MOUSE.

The success of any computer depends in part on the "friendliness" and accessibility of the user interface.

Especially in the field.

A standard mouse interface is fine for the expanse of a desktop, but not for work on the move.

So with the Gavilan, we incorporated a built-in touch panel: the first fully integrated computer mouse.

It's a pressure-sensitive pad just above the keyboard. Finger movements across the touch panel control the on-screen movements of a cursor.

But like a mouse, the Gavilan touch panel actually executes virtually all of the user commands, saving the keyboard for typing only.

Through the touch panel, users store and retrieve data. Cut and paste. Move documents. Scroll through pages of information. Zoom out for a complete look at the format of a document. Or even ask the computer what just happened and what to do next. With one finger.

SOFTWARE IN A CAPSULE.

The intuitive ease of talking to the computer through the touch panel is made possible by the unique Gavilan operating environment and software packages.

The applications packages come in durable capsules called CapsuleWare.™ They plug directly into the body of the computer, adding no additional volume. The operating software, (GO System™) then lets each of the applications communicate with each other through a common interface and a sharing of data.

The result is a completely integrated information environment that lets the user combine spreadsheets, graphics and word processing text together.

All in the same uninterrupted user mode.

OUTWARD MOBILITY FOR USERS, UPWARD MOBILITY FOR OEMs.

The Gavilan mobile computer and its CapsuleWare programs are creating vertical market demands—both in MS/DOS and the Gavilan operating environment—for software packages completely unrealized one short year ago.

That means new opportunities in applications development far beyond the typical office-bound programs. From air and sea navigation to banking services. Journalism to field auditing. Anthropology to insurance.

And that means you've got the chance to be first in your chosen field.

A position we strongly advocate.

Gavilan Computer Corp.
P.O. Box 5004

strategy should use information technology either directly to add unique features to the product or service or to contribute to quality, service or image through the functional areas.

Although a firm may benefit from an information technology application that is not consistent with its competitive strategy, it will enjoy much greater strategic benefits from an information technology application that is consistent with and supportive of its competitive strategy. Understanding a firm's strategy is critical to the selection of appropriate automation projects, because applications that contribute to a cost leadership strategy are very different from applications that contribute to a differentiation strategy.

When a firm pursues a cost leadership strategy, information technology must create or support opportunities in these same areas. Information technology applications can substantially reduce costs in the functional areas of engineering, design and manufacturing. Information technology can also be used to reduce waste significantly, to improve productivity and to identify marginal customers. The firm that vigorously pursues a cost leadership strategy should identify and execute information technology projects that support and advance such a strategy.

Conversely, a strategy to achieve a differentiated position in an industry has a very different set of requirements. The differentiation strategy requires a perceived uniqueness in design, brand image, technology, product features, customer service, dealer networks or some other category. Usually, firms pursuing a differentiation strategy are most successful when they establish uniqueness in several categories. A distribution company specializing in periodicals differentiated itself in service reliability, responsiveness to customer needs and additional product features primarily through its computer systems. Among nationwide periodical distributors, this firm is perceived as the most sophisticated and highest quality firm in the industry.

Information technology can support a differentiation strategy in a variety of ways. It can contribute to superior customer service by providing historical customer profiles and by increasing the availability of spare parts with a dealer inventory system. Information technology can contribute to high quality through the use of quality control systems and through the use of computer-aided manufacturing systems, which provide flexibility and improved responsiveness to customer needs. Information technology can create better product designs, satisfying both manufacturing and marketplace requirements. In some instances, information technology can also provide access to markets that would otherwise be too remote to service.

Figure 2 shows how information technology applications must be specifically chosen to support the generic strategy of a firm. Applications supporting a low-cost generic strategy are designed to take advantage of

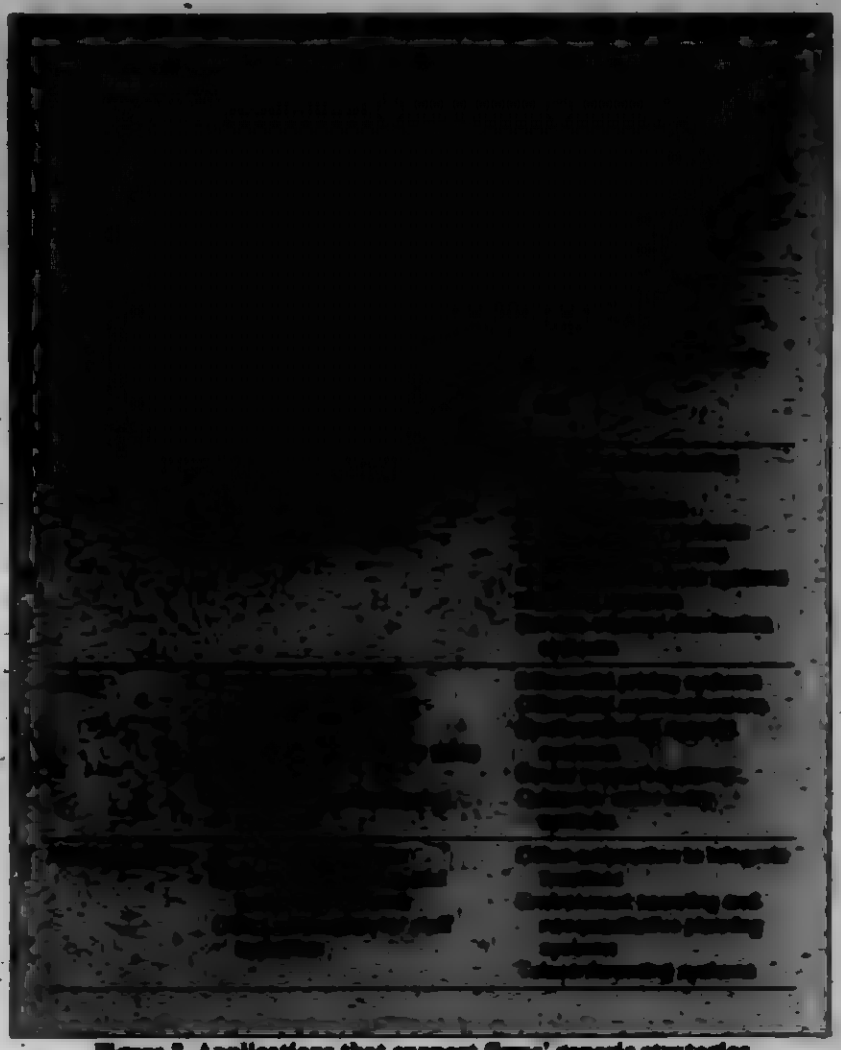

Figure 2. Applications that support firms' generic strategies

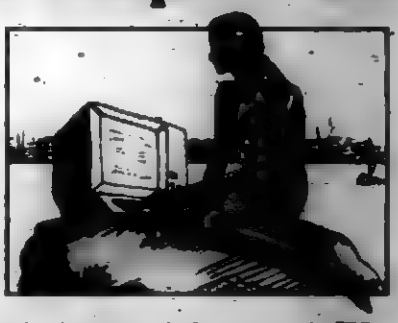
Reach the Danish computer market with Computerworld/ Denmark.



The Danish EDP market is growing at an incredible rate of 23% annually. Last year, this market was valued at more than $185 million. And the U.S. is Denmark's major supplier of EDP products accounting for 40% of the country's computer equipment imports.

When Danish computer professionals with purchasing power want the most up-to-date local and international information on the EDP industry, they read *Computerworld/Denmark*, sister publication to *Computerworld*. *Computerworld/Denmark* is a bi-weekly newspaper serving the Danish computer community with the latest developments in hardware, software, terminals and other computer products and services. And, in every issue, the *MicroWorld* section reports on the special needs of the micro end-user and the status of the market.

So, if you'd like to market your products or services internationally, *Computerworld/ Denmark* has a circulation of 20,000 computer professionals who would like to hear from you.

CW International Marketing Services will give you one-stop advertising service in countries around the world. We will translate your ad and bill you in U.S. dollars. For more information on *Computerworld/Denmark* or any of our other foreign publications, just fill out the coupon below.

"If you want to do OEM computer business in Europe you should go to the Invitational Computer Conferences in England, France, Germany and Scandinavia ...We do!"

Europe is a true regional market place and experienced marketing management knows that the best way to reach the technical decision maker/ buyer is to meet him where he lives and works, demonstrate operating equipment and provide him with the technical information he needs. During the past three years, successful marketers have found the Invitational Computer Conferences to be the most cost efficient, effective method of covering their multi-national, computer industry customer base.

The exclusive, one-day, OEM conferences will be held in five-market areas in Europe and are attended by a select, invited audience of OEMs, systems houses and quantity end users. Guests can participate in a variety of technical seminars and view operating displays of the newest computer and peripheral equipment. The informal setting makes it easy to meet with potential customers one-on-one and the simple table-top displays keep exhibit costs at a minimum.

Although it is clear that information technology applications should be consistent with a firm's strategy, little attempt is made in many firms to understand how the technology will affect the firm's strategic position in the industry or how it might support a business strategy.

existing and emerging information technology to achieve a low-cost position in an industry. Applications supporting a low-cost strategy are substantially different from applications supporting a differentiation strategy.

The strategic success of information technology projects within a firm depends upon how well they support the firm's competitive strategy. In one instance, a firm following low-cost strategy gained little strategic benefit from a computer system that offered many options and much flexibility but that was very expensive to operate.

Over time, the overall cost leadership strategy of the firm continued to narrow the product line and to streamline operations, requiring the functional areas to standardize and limit options. The large, expensive, multioption system, which was still being developed, ran counter to the firm's strategy. As a result, the system was only partially used, and parts of it were never implemented. Now the users in operations correctly feel that using the system makes it difficult for them to meet their functional objectives as dictated by the cost leadership strategy. They want to scrap the system and buy their own package, which will run on a minicomputer.

In other firms, information technology developments were linked to a specific strategy, and users were very enthusiastic about implementing the systems. They felt the systems were valuable because they helped them carry out assignments within the overall strategy. System designers must realize that the strategic benefit will only be realized if there is a commitment to and acceptance of the system by multiple functions and levels in the organization.

Effective strategy requires coordination of many interfacing functions. Management must consider such factors as supporting subsystems, personnel and compensation to ensure an information technology system will contribute significantly to a strategy. For example, highly sophisticated, information technology-enhanced tools for selling insurance will not be effective if salespeople are not hired, trained and motivated to use the systems.

Although it is clear that information technology applications should be consistent with a firm's strategy, little attempt is made in many firms to understand how the technology will affect the firm's strategic position in the industry or how it might support a business strategy. For example, a number of major U.S. banks have recently removed their top information systems executives. Although a variety of explanations were given for these management changes, the underlying reason was that information technology was not being managed in a way consistent with the banks' strategic needs.

The problem, of course, was not that these executives could not develop technology consistent with the bank's strategy. The problem was and continues to be that neither the bank executives nor the information systems executives understand how information technology affects their business. Neither group can articulate how computer hardware and software should support or extend the bank's ability to make money.

For years, technical experts have expressed concern over whether a firm's computer systems met their needs. Unfortunately, these experts did not understand the needs of a business from a competitive viewpoint, as they did not perceive information technology to be in the competitive domain of a business. In spite of this general lack of strategic direction, firms in many industries are using information technology to their competitive advantage.

As technology continues to develop rapidly and becomes a major factor in more industries, firms must begin to manage strategically information technology. The framework presented here describes the first steps management should take to link information technology to a firm's competitive strategy by analyzing its impact at the industry, firm and strategy levels.

By understanding when, where and how information technology will affect a firm, management can develop an explicit strategy that makes the necessary trade-offs and directs resources to take advantage of opportunities while mitigating threats. Without such an understanding, firms will continue to ride a speeding technological roller coaster, spending more money and acquiring new hardware without sound business justification.

About the Author

Gregory Parsons is assistant professor of business administration at the Graduate School of Business Administration, Harvard University. He consults on information systems technology and its impact on competition and business strategy.

UNLEASH THE POWER
of your IBM PC® with Fox 10-BASE™.

NEW, from Fox Research. 10-BASE is the most powerful, easy-to-use Data Base Management System *ever* designed for IBM PCs and compatibles. And, at just $495, it's a powerful value.

10-BASE speaks "IBM"®. We translated IBM's Sequel (SQL) into "PC" to put flexibility and astonishing power at your fingertips.

Power to let you grow into networking as your business grows.

Power to do your job with fewer commands.

Do more.
Do it better and faster.

Access as many files as you need, with as many records per file as you want. Create new "files" from existing files with a single command. Then use the automatic Data Dictionary to overview everything.

The whole idea, after all, is to spend your time evaluating information, not looking for it.

RESEARCH

30-Day Free Trial

☐ YES! Here's P.O. # _____ for $495.00 (plus applicable tax). I want to try 10-BASE on a 30-day trial basis. If I'm not completely satisfied, I'll return my 10-BASE and cancel my P.O.

Seven systems were evaluated in the benchmark tests. The results show how Mumps stacked up.

A case for Mumps

In benchmark tests to determine the systems vendor for a retailing application, Mumps — perhaps surprisingly — proved the superior choice for programming language performance.

By Casimiro Alonso

The system buyer's dilemma is familiar: "Overpurchasing" immediately results in wasted resources, and the waste may continue for years. Yet purchasing only enough computing power for current needs usually means that sooner or later the operations manager must choose among four distasteful alternatives: accept slow response times, limit the number of terminals and applications, redesign and reprogram applications or upgrade the CPU and install larger disks.

This situation is especially troublesome for systems vendors, like our company, who are often required to bid competitively on meeting a potential customer's needs. Overspecifying could mean losing the job to a competitor. Underspecifying means the system will fail to meet long-term customer needs.

We are always careful to examine solutions such as modular hardware that is easily upgradeable, software that is upward-compatible and distributed processing systems linked with local-area networks. Yet, more and more, we find that the simplest solution is the best: to provide the very highest system price/performance right from the outset.

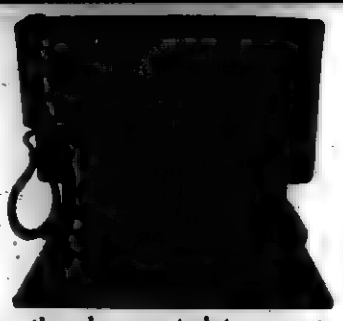
Recently, hardware vendors have made great strides in improving the price/performance of microcomputers, as evidenced by Motorola, Inc. 68000-based systems. However, hardware vendors primarily stress machine performance and are not as aggressive in matching hardware improvements to software progress as some would like them to be. In fact, programming languages and operating systems have followed from mainframes to minis to superminis to micros without changing sufficiently to accommodate many of today's interactive needs. Now, this outdated software is often a bottleneck to a true increase in total system performance.

Put to the test

Just how much difference good system software can make in performance recently came out in a series of benchmark tests we were involved in as part of a bid to provide an administrative computer system to a department store.

Getting this contract required demonstrating superior performance, with the lowest overall cost, over several competitors in actual customer applications. Each

GET EVERYBODY ON BOARD.



Now there's a way to let everyone in your company chip in.

AT&T Information Systems, the company whose unparalleled communications heritage has been bringing people together for 100 years, now brings your office together. With state-of-the-art office automation that's designed to get your company moving ahead.

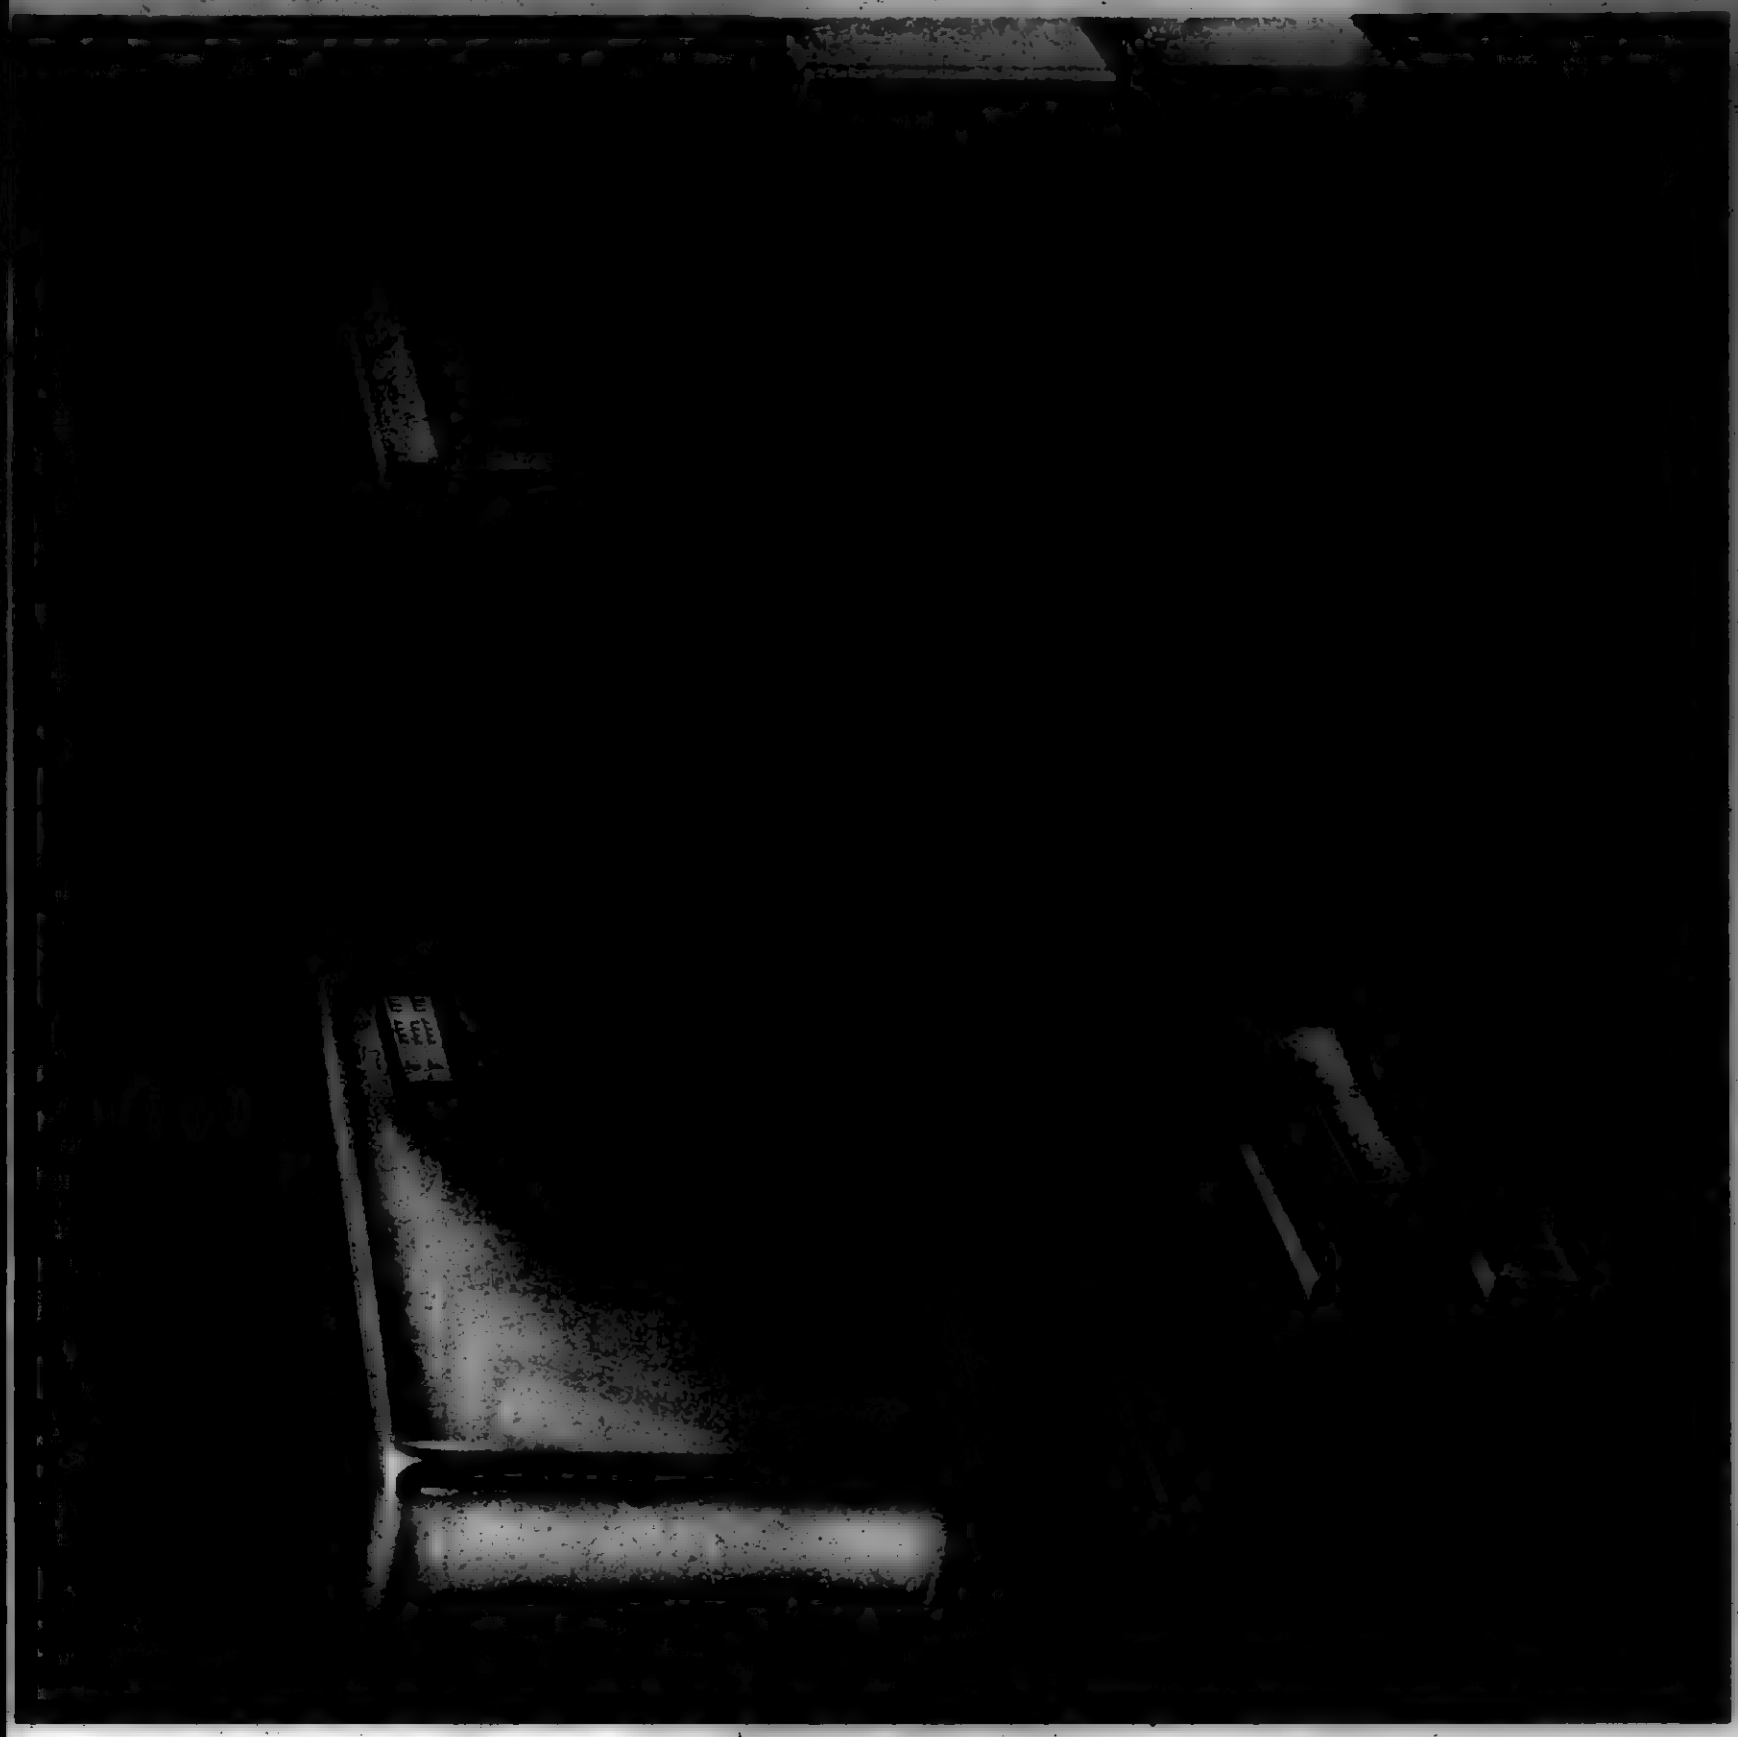
Electronic Document Communications, now available on System 85 and DIMENSION PBX, is an easy-to-learn software application that's hard to beat. Because it integrates your office by letting everyone prepare, send and store documents and messages with the speed and efficiency of a computer. So you can have better access to the right information in the right form at the right time.

Electronic Document Communications can streamline your office in three ways:

Preparing Information—Reduces the time, effort, cost and wasted paper between drafts by electronically creating, editing and formatting documents and messages. "The Composer," a special software feature, checks spelling, grammar, punctuation and usage. EDC even measures whether documents are readable by technical and nontechnical readers.

Moving Information—Speeds documents to many people in different locations simultaneously so they can act decisively. EDC allows you to determine the timing and cost of delivery, and even check to find out when documents were received. Using a password ensures the privacy of your messages.

Managing and Storing Information—Locates documents, and retrieves and evalu-



ates contents quickly and easily with electronic files—while reducing the possibility of losing documents. An electronic "Mailbox" allows you to quickly determine which documents to read first. EDC reduces storing and filing costs with an electronic "Archives" that allows for either short- or long-term storage, and the "Wastebasket" which enables you to permanently delete items after a determined period of time. There's even an electronic "Calendar" that checks personal schedules and arranges mutually convenient meetings.

Not only will all these features help you further integrate your office, Electronic Document Communications is itself just one part of AT&T's line of completely integrated business systems. For state-of-the-art office automation, you can implement EDC in conjunction with other applications software like Message Center/Directory, a call coverage and message system. These office management applications are now available on System 85 and DIMENSION® 600 and 2000 systems with the Applications Processor.

The result is you'll be able to improve staff productivity at every level and get everybody on board. And as new features are developed in the future, they'll be compatible with your existing equipment.

EDC was developed by Bell Labs systems designers who now work for AT&T Information Systems Laboratories. AT&T Western Electric produces EDC, and AT&T Information Systems will maintain it with comprehensive, conscientious service from the largest service organization in the industry. To find out more, call toll-free 1-800-247-1212, Ext. 879M.

AT&T's Electronic Document Communications: It's part of the integrated office of tomorrow that you can board today.

AT&T Information Systems

IN DEPTH/A CASE FOR MUMPS

competitive bid was based on providing both economical application development and an efficient run-time environment. In addition, we wanted to assure that the system we proposed was expandable and economical over the long term, as well.

From previous experience with the Mumps language, we were aware of its ability to improve programmer productivity and, thus, to reduce software costs by speeding up development time. We also liked the fact that Mumps provided easy portability from micros to minis to superminis. We were, therefore, inclined to go with a Mumps-based system. However, what overall effect Mumps would have on system performance and whether it would allow the full functionality required for winning the contract was unclear.

The data for the comparison was submitted by the different hardware vendors, and each vendor was kept informed of the results of each other vendor so as to encourage each to obtain the best possible performance from his system.

The benchmark took the form of comparing Mumps with other languages and data base systems in terms of disk occupation, processing speed and lines of code needed. Specifically, it consisted of:

1. Creating a data base with the following structure:

Files:

Parts file (1,000 records).

Color file (6,000 records) containing six "color" records per "part."

Size file (48,000 records) containing eight "size" records per "part-color."

Store file (288,000 records) containing six "store" records per "part-color-size."

Supplier file (30 records).

Family file (20 records).

Relationships:

Part-color-size-store (343,000 relations).

Store-part-color-size (343,000 relations).

Supplier-part (1,000 relations).

Family-part (1,000 relations).

2. Creating a data base that gives stock and sales charts as well as stock value per family part-color-size-store. The query implied the use of the "family-part" and the "part-color-size-store" relations. Two different queries were performed: a "long" one requiring access to 17,650 records, and a "short" one, accessing just 50 records.

On the data base creation test, Mumps was from half again as fast to 18 times as fast as the other systems. The Mumps data base also occupied only one-half to one-fourth of the disk space required by others. And Mumps programming required one-third fewer lines of code.

The chart on the cover page shows the technical specifications of the different systems evaluated in the benchmark.

Results on seven systems

Mumps performed much better than the other languages on almost every comparison run (again, see cover page). On the data base creation test, for example, Mumps was from half again as fast to 18 times as fast as the other systems. The Mumps data base also occupied only one-half to one-fourth of the disk space required by others. And Mumps programming required one-third fewer lines of code.

In summary, in different comparisons on various machines, Mumps was bested only once.

A more significant fact is that a Digital Equipment Corp. PDP-11/44, running Mumps, actually outperformed all 16-bit and most 32-bit minis on most of the tests.

This data indicates that a user choosing Mumps software for interactive data base applications can expect up to five times more power from a given computer. And this power, in turn, will eliminate many of the performance problems encountered by minicomputers in administrative environments.

In addition, the data laid to rest the criticism that the

IN DEPTH/A CASE FOR MUMPS

The system we were prepared to recommend to our customer was a DEC VAX-11/750 under VMS, running VAX-11 DSM. This recommendation was made to allow the user to take advantage of Mumps as well as gain the 32-bit capability and future growth and versatility of the VAX.

Mumps "interpreter" approach imposes performance penalties on applications. The results show clearly that Mumps is not at all slower than other software. Indeed, it offers an incredible performance increase over competitive systems.

For these reasons, we decided to recommend that our client go with a Mumps applications program.

Implementations on DEC CPUs

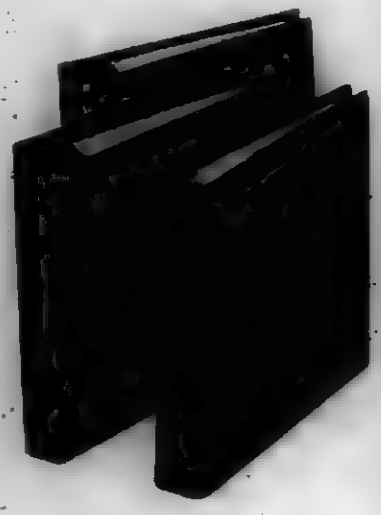
At the time of the benchmark comparisons, the development system in our company was a DEC PDP-11/44 with RK07 disk drive running DEC-standard Mumps, DSM V2.2.

The system we were prepared to recommend to our customer was a DEC VAX-11/750 under VMS, running VAX-11 DSM. This recommendation was made to allow the user to take advantage of Mumps as well as gain the 32-bit capability and future growth and versatility of the VAX. However, it also meant that we would have to use an outside VAX to refine the programs after we developed them on our own in-house 11/44. This procedure presented no problem, because no modification of source code would be needed in order to move the Mumps programs between the 16- and 32-bit CPUs.

The performance obtained in-house with the 11/44 was exceptionally good and placed us far ahead of the others preparing competitive proposals. It also provided a large margin for the additional overhead burden we expected in moving from the PDP-11's dedicated operating system to the general operating system of the VAX. Unfortunately, when moving to the VAX, the overhead turned out to be greater than we anticipated and threatened to wipe out much of our competitive advantage.

Before making the final proposal, we decided to test the latest Mumps implementations on the VAX to see how much, if any, performance improvement was possible. We contacted both DEC and Intersystems Corp., two major Mumps suppliers, for help. DEC responded with an improved, experimental VAX-11 DSM (2.1); Intersystems with its current M/VX.

The basic difference between DEC's experimental and current



DASD MANAGEMENT AWARD WINNER

The world's leading DASD management system, installed in more than 750 Fortune 1000 sites. Tailored to IBM VS1 and MVS, operating environments, yet doesn't rely on any IBM utility. DMS/OS — with disaster recovery — gives you more space and more usable DASD reports. Here is a direct-access storage device management system that dramatically reduces DASD conversion time, frees up operator time, and provides enforced control standards.

Is it any wonder that over 75% of world's leading industries turn to Sterling Software Marketing and DMS/OS for DASD management?

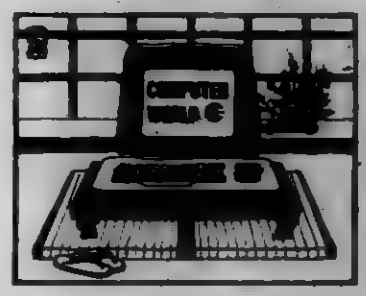
Computerworld/Japan can bring your message to the world's second largest computer market.



The Japanese computer industry is growing at a rate of 20% per year. There are currenty more than 101,000 installed general purpose computers valued at over $18 billion. This figure does not include minis, micros and personal computers. Small business computers are currently the leading growth sector in the Japanese computer market.

Japan is looking for well-developed technology that will meet their future needs. And with no strong independent software industry of its own, Japan offers great opportunity for U.S. manufacturers in the packaged software market.

Computerworld/Japan is a weekly publication covering the latest developments in the Japanese computer industry with reports on new products, services and trends. Its 30,000 subscribers include top management and DP professionals throughout the country.

CW International Marketing Services gives you one-stop advertising service in countries around the world. For more information on *Computerworld/Japan* or any of our other foreign publications, just fill out the coupon below.

Figure 1

Figure 2

VAX-11 DSM is that the new version uses a global handler that minimizes the use of RMS isam files to store data base files ("globals" in the Mumps world). The currently marketed version relies heavily on the use of RMS isam files.

M/VX does its own data base handling within one RMS file. It is more specialized software, designed to minimize dependency on both operating and record management systems. Since it minimizes dependency on operating system facilities, it avoids much of the overhead associated with general operating systems.

The comparative test of these implementations produced a pleasant surprise (see Figure 1). The results show that DEC's experimental VAX-11 DSM X2.1 can provide performance on a VAX 750 comparable to that of an 11/44 running DSM-11. Further, they show that with M/VX, a VAX 750 can clearly outperform an 11/44, and a VAX 780 can become an "unbeatable" machine.

In short, these tests show that it is possible to combine the advantages of the VAX with the advantages of Mumps, without the performance losses resulting from the overhead of a general operating system.

Mumps, Cobol on VAX

Although the benchmark was set up to compare several systems, we also thought it would be informative to demonstrate to the customer the results obtained when running the data on the same VAX 750 using first Cobol, then Mumps. The results were as shown in Figure 2.

Because of this series of benchmark tests, our company was able to make a strong, well-supported recommendation for a powerful, versatile and fast hybrid system: a DEC VAX for 32-bit capability and future flexibility and Intersystems M/VX for high-performance Mumps applications programs.

On this recommendation, we were selected, and our customer ordered three VAX systems as described above. They are now up and running.

Prior to installation, the customer was also able to save considerable development time by assigning three programmers and a systems analyst, none with prior Mumps experience, to develop and test applications on our in-house PDP-11. This development work was possible because no conversion was needed when the applications moved later to the VAX.

The applications development took about one-third the amount of time that had been forecast for the use of other languages. Seven complex applications were developed in a space of about four months.

In addition, the customer got a bonus in disk space savings, which provides growth potential and a future possibility of saving money in disk configuration.

HARD TALK

TOM HENKEL

U.S. control over what hardware is shipped to foreign countries is falling apart. With more computer systems, peripherals and components being shipped today than ever before, it is becoming clear that the government hasn't the slightest idea where much of it is going.

It is impossible to check every box on every airplane, boat or truck that departs U.S. borders. And it's equally difficult to make sure computer systems that leave the U.S. for sanctioned sites actually reach their destinations.

Let's face it, no one really knows what happens to a box when it is shipped from point A to point B. Items pass through many hands and visit many freight yards before winding up, usually, at the address listed on the shipping label.

Sometimes things go wrong. While logic dictates that big things like computer systems just do not vanish, many DPers have spent days waiting for a desperately needed replacement part that was loaded on a truck on Tuesday and has not been seen since. There are hundreds of horror stories about shipped items, even entire freight cars, that have been missing for years.

The U.S. Customs Service recently snatched two Digital Equipment Corp. VAX-11/782 superminicomputers from West German and Swiss docks. They said those systems had been laundered out of the U.S. and were destined for the Soviet Union. They reportedly were to be used for military applications.

But keeping two VAX processors out of the Soviets' hands hardly solves the problem.

High tech has become a worldwide preoccupation. That means the United States no longer holds the plug to every computer system built. The Japanese, for example, make most of the components that go into the VAX, as

See CONTROL page 61

DP disasters hurt entire firm

Planning seen key to survival

By Leif F. Sennagel
Special to CW

Disasters in the computer room affect not only the DP operation, but the rest of the company as well. A corporation's cash flow can be interrupted, its position in the marketplace can be hurt, customer and employee relations can be strained and a firm's purchasing power can be jeopardized.

While there is no way to prevent many disasters, the risks and implications of a significant disruption of DP services cannot be ignored.

Planning is the key to survival in any contingency program. The goal is to get critical applications running as quickly as possible regardless of the reason the system is not working. For example, there can be hardware damage resulting from a fire, explosion or power failure.

But also remember that a system can be rendered helpless by other factors. For example, a data communications failure could make vital data inaccessible.

But contingency planning involves more than just finding innovative ways of getting the hardware back on-line. There are many issues to consider. For example, how much money will a firm lose if a critical application is lost? What happens if that application is down for an extended period of time?

Function at many levels

A contingency plan can function at many levels. It is up to the DP executive to determine which steps a firm should take to protect its data. This decision should include an economic justification of various contingency planning alternatives and integrate top management and user views.

A good contingency plan must also hold provisions to test and refine the plan.

There should be a framework for maintaining the plan. This involves training personnel in how to recover suc-

Selanar announces upgrades

SACRAMENTO, Calif. — Selanar Corp. has announced a series of graphics upgrades for terminals and printers produced by Digital Equipment Corp., Qume Corp., Televideo Systems, Inc. and Lear Siegler, Inc.

The SG480, SG481 and SG482 reportedly are user-installable, high-resolution graphics upgrades for the DEC VT100, VT101 and VT102, respectively, featuring 800- by 480-pixel resolution and Tektronix, Inc. 4010 and 4014 emulation with enhanced graphics module. They feature variable character sizes, variable line types, point plot, incremental plot, write-through mode and crosshair cursor.

The upgrades are priced at $1,195, the vendor said.

Also announced by Selanar were the SG101-D and SG102-D low-resolution upgrades for the DEC VT101 and VT102, respectively. They reportedly feature 700- by 250- by 2-pixel resolution, Tektronix 4010 and 4014 emulation and user installation in less than 15 minutes. They are priced at $795.

For the Lear Siegler 3A, 3A Plus and 5, Selanar is offering the SG305 low-resolution retrofit board. It reportedly features 640- by 240- by 2-pixel resolution, Tektronix 4010 and 4014 emulation and 30-minute field installation. It is priced at $795.

Selanar also announced the SG970 and SG102Q, which are retrofit graphics boards for the Televideo 970 and Qume QVT102 terminals. Priced at $795, they reportedly feature Tektronix 4010 and 4014 emulation with enhanced graphics modules and are user installable in less than 20 minutes.

The Selanar SG120V provides standalone Tektronix 4014 graphics and is compatible with the DEC LA34, LA50, LA100 and LA120 printers.

According to the vendor, the SG120V offers a resolution of 132 dot/in. horizontally by 72 dot/in. vertically, a 7,000-vector buffer, a 100K-byte spooling buffer, switch-selectable bit/sec rates between host and printer, eight selectable picture sizes and rotation of picture. It is priced at $1,095.

Fluent Communications From a Polished Performer

Series II Plus

We've added a little polish to our Series II family of protocol converters. The result is the Series II *Plus*, a complete line of SNA/SDLC and Bisync protocol converters. If you've become accustomed to the performance of KMW 3270, 3770, HASP and 2780/3780 protocol converters, you're going to appreciate the *Plus*.

Pluses

+ Diagnostics

The KMW Series II *Plus* provides three levels of extensive on-board diagnostics for trouble-shooting without ever opening the unit. Level one testing includes PROM and RAM tests as well as confidence tests of most system components. Level two testing is a much more comprehensive test of system components including I/O circuits. Level three is controlled via the system console and includes the ability to move data files to each of the supported peripheral devices.

+ Programmability

Host session and asynchronous device parameters are programmable via the setup mode on the system console. Programmable host session parameters include:

- log on information
- device address
- buffer size
- data rate

Programmable asynchronous device parameters include:

- device type
- character framing
- input mode
- data flow control
- output mode
- data rate

Setup data can be permanently held in EEPROM even when the Series II *Plus* is powered off.

+ Speed

Featuring a Z80A processor, the Series II *Plus* is capable of data rates up to 19.2 Kbps or, with optional Z80B processor and DMA, up to 56 Kbps as well as concurrent operation of up to 8 input/output devices at equivalent rates!

+ Code Compliance

The Series II *Plus* converters meet the FCC emissions requirements and are designed to satisfy those requirements when included in subsystems. The Series II *Plus* is also UL and CSA listed.

+ Fluency

The Series II *Plus* provides fluent communications in IBM SNA and Bisync protocols including 3770, 3270, HASP and 2780/3780. All Series II *Plus* converters support a multitude of input and output devices and are available with up to 8 ports (3 in 2780/3780 converters). You can count on the Series II *Plus* for fluent IBM to ASCII communications.

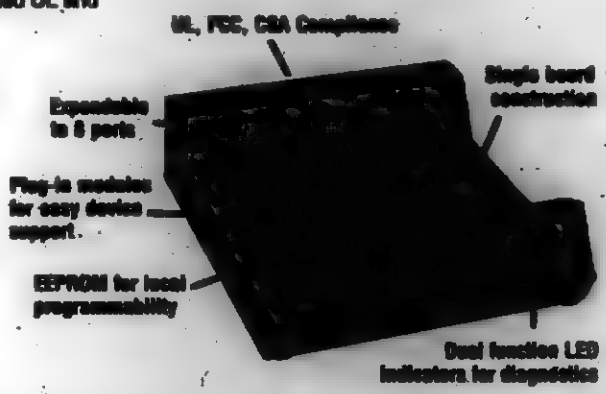
+ Hardware Design

Another Series II *Plus* advantage is the efficient hardware design of the unit. The sleek exterior lines give way to a plug-in modular interior which provides for maximum flexibility, a high degree of reliability and ease of maintenance. KMW's unique hardware design allows for a series of plug-in modules to provide device interfaces. Standard interface modules include Data Products 8 bit Parallel Printer interfaces, Documation Parallel Card Reader and RS-232 Serial General Purpose interfaces.

The reliability of the Series II *Plus* design is exemplified by an impressive mean time between failure of over 13,000 hours. That's a real plus.

With a mean time to repair of only 30 minutes, down time is always at a minimum.

The Series II *Plus* is engineered for performance and the proof is in the package.



A Special *Plus*

The Series II *Plus* is available in synchronous-to-synchronous configurations including 3770 to 2780/3780 or HASP to 2780/3780. If your applications require something special, check with KMW.

Add a little polish to your communication. The Series II *Plus* . . .
Fluent communications from a polished performer.

SYSTEMS AND PERIPHERALS

CONTROL

from page 59

well as other large-scale processors.

Many countries are importing Japanese components and integrating them into computer systems. Scotland's so-called Silicon Glen is dotted with microcomputer manufacturing plants that buy up Japanese components and use cheap Scottish labor for assembly.

Burgeoning industry

Israel has a burgeoning software industry. Taiwan is making chips. The list goes on, and it will continue to grow. If the Soviets want a VAX-level processor, they are going to get it, if not from an American manufacturer, then from a foreign source.

While the U.S. currently holds the top slot when it comes to technology, there is no guarantee it can keep those technologies under wraps.

Even if the current, outdated, U.S. export laws that forbid U.S. manufacturers from dealing with the Soviets are stiffened, other countries are sure to find the Soviet Union an extremely fertile market in which to sell electronics. After all, without the IBMs and DECs of the U.S. as competitors, selling hardware becomes a much easier task.

PLANNING

from page 59

cessfully from a disaster.

Gaining top-level, corporatewide support for a disaster recovery plan is probably the strongest guarantee for success.

Three basic steps

To do this, there are three basic steps that help define the overall impact of the DP operation on the rest of the company.

■ The first step is to evaluate thoroughly the costs and benefits of a contingency plan. This involves input from the DP department as well as from the users of the system.

■ Next, the DP executive must determine which applications are most critical to the firm's operation. This involves a priority analysis of applications, determining the operating requirements for each of the key applications.

This phase also includes an analysis of the risks and benefits of various recovery alternatives.

■ The last step involves the actual development of a contingency plan. This plan should be developed by the DP personnel so that they are familiar with its structure. The final step also involves testing the contingency plan to make sure it works and training personnel in how to cope with a disaster.

At the conclusion of each of these phases, an interim report of observations, findings and recommendations should be released to management for review and comments before proceeding to the next phase.

In this way, management involvement is maintained, and there is a higher potential for a workable contingency plan.

The main reason a contingency plan fails is because the firm chose a technical solution before adequately understanding the management requirements of the organization.

Somogyi is an information system services specialist with Ernst & Whinney, a Cleveland-based disaster recovery consulting firm.

TURNKEY SYSTEMS

AGENCY MANAGEMENT SYSTEMS, INC.
Turnkey management and marketing system

Agency Management Systems, Inc. (AMS) has announced a turnkey management and marketing system, designed for independent insurance agents and brokers. The system is based on IBM's Personal Computer.

The AMS micro includes an IBM Personal Computer with 256K bytes of main memory, a 35M-byte hard disk drive, 60 char./sec letter-quality printer, streaming cassette tape drive for backup and a mouse. Software includes accounting, billing, client services, diary, word processing, query and marketing.

The software for the micro provides the marketing and management tools that the company offers in its IBM Series/1 minicomputer system.

The AMS micro costs approximately $16,000, the vendor said.

AMS, Suite 300, 150 Interstate N., Atlanta, Ga. 30339.

DATA STORAGE

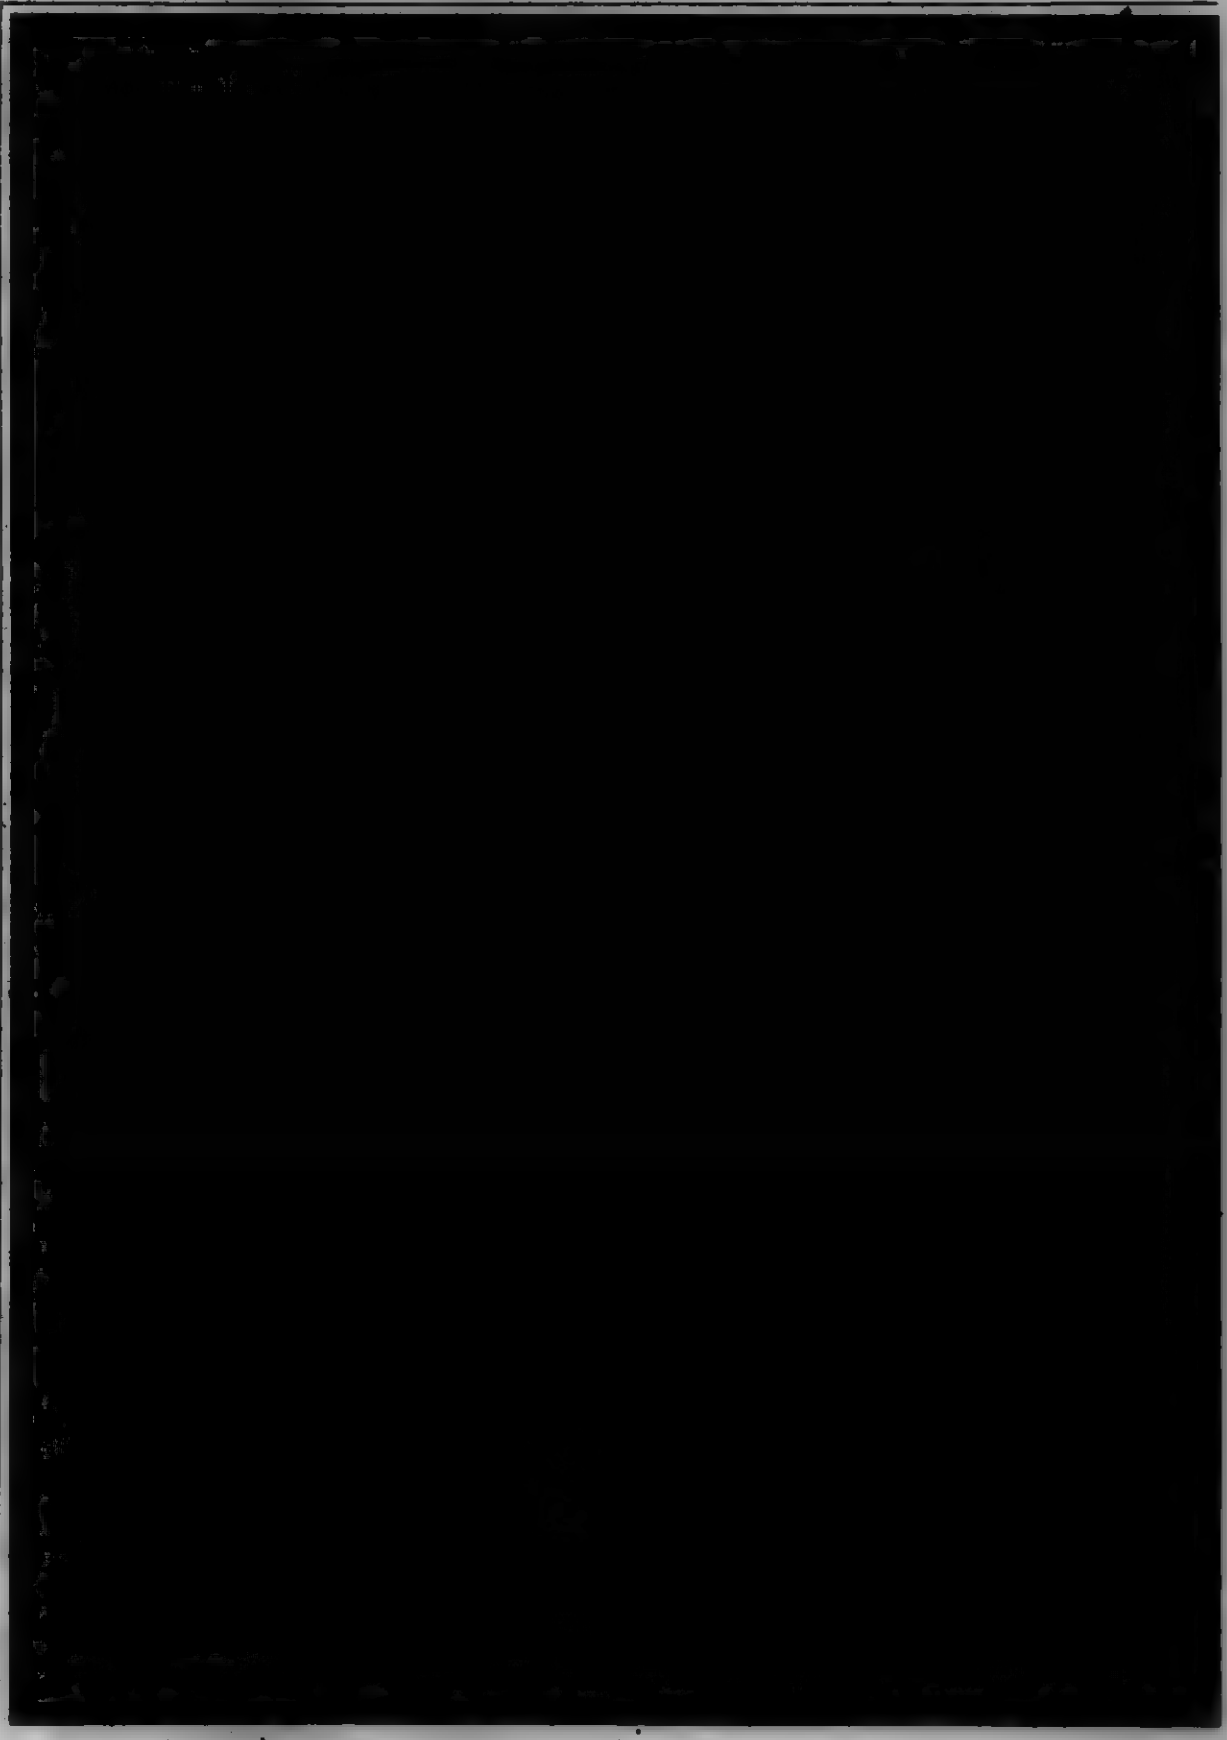
QANTEX DIVISION OF NORTH ATLANTIC INDUSTRIES
Jetstream 16

A streaming cartridge tape system that can read and write as a 9- or 18-track tape drive and offers up to 90M bytes of storage is available from the Qantex Division of North Atlantic Industries.

Called the Jetstream 16, the unit is both QIC 02- and QIC 24-compatible and was designed as backup storage for Winchester disks in the 30M-byte range and higher. The unit is said to provide up to 80M bytes of formatted data on a standard data cartridge, in addition to reading and writing the standard 9-track, 45M-byte format. The system handles burst transfer rates of up to 400K bit/sec, the company said. An average transfer rate of 72K byte/sec is required to maintain streaming.

Other features of the microprocess-

Continued on page 62



SYSTEMS AND PERIPHERALS

Continued from page 81

ser-based Jetstream 16 include automatic reference burst location, automatic cartridge identification, error logging and diagnostic tests.

The Jetstream 16, including controller, costs $1,450 in single quantities, with OEM discounts available, the vendor said.

North Atlantic Industries, Quantex Division, 60 Plant Ave., Hauppauge, N.Y. 11788.

TARGA ELECTRONICS SYSTEMS, INC.
DR1101 data recorder Solidrive, FDE425 CH40 holder/interface

Targa Electronics Systems, Inc. has announced a line of industrial bubble memory data storage systems designed for moderately rugged plant and factory environments.

Available in sealed, removable cartridges of 128K bytes or 256K bytes, the memory systems were designed for industrial and laboratory data acquisition and process control applications, the vendor said.

The DR1101 data recorder is a self-contained, benchtop device with various interface and software protocol options. The unit includes an RS-232C or IEEE 488 communications port with software implemented to emulate a Digital Equipment Corp. TU-58 cartridge tape recorder or a Hewlett-Packard Co. HP 82902 floppy disk drive.

The Solidrive FDE425 is a floppy disk emulator that is electronically compatible with Anfi standard drives and fits a 5¼-in. footprint. The unit can be changed from one standard format to another, the vendor said.

The CH40 OEM holder/interface subassembly series was designed for manufacturers of such equipment as portable computers, control systems and geophysical instruments.

It is available with serial or parallel communications and simple software protocols, the vendor said.

Single-unit prices for 128K-byte versions of the Targa systems are $2,995 for the DR1101 data recorder, $2,495 for the FDE425 floppy disk emulator and $1,795 for the CH40 holder/interface, according to the company.

Targa Electronics Systems, P.O. Box 8485, 3101B Hawthorne Road, Ottawa, Canada K1G 3H9.

ROTHCHILD CONSULTANTS
Optical Memory Report

Rothchild Consultants has announced that it will publish an annual report, with periodic updates, on developments in the field of optical disk drives, optical media and digital read-only disk drives.

The "Optical Memory Report" will provide manufacturers, users and venture capitalists with information about product specifications, vendors, OEM and user prices and market forecasts.

The first edition is scheduled to be published in the spring of 1984 at a cost of $1,995. It can be purchased at a discounted prepublication price of $1,495 if payment is received before April 1, according to the vendor.

Rothchild Consultants, P.O. Box 14817, San Francisco, Calif. 94114.

FUJITSU AMERICA, INC.
M2333; M2330AT; M2333AT

Fujitsu America, Inc. has announced an 8-in. Winchester disk drive and two half-high, 5¼-in. rigid disk drives.

The 8-in. drive, the M2333, reportedly offers 337M bytes of unformatted storage in a package that measures 5 in. by 8½ in. by 15 in.

A pair of the drives reportedly can be installed side by side in a standard 19-in. rack to provide 674M bytes of storage. The drive is said to feature an average positioning time of 20 msec, and a data transfer rate of 2.4M bit/sec with a storage module drive plus interface, according to the vendor.

Evaluation units reportedly will be available in August with production delivery scheduled for November at a price of $5,500 in quantities of 100.

The 5¼-in., half-height drive, the M2330AT, reportedly offers 6.6M bytes of

Third in a series of reports on the role of personal computers in the office.

The most important program we've ever written.

Personal computers, in general, don't require nearly as much service and support as mainframes. Apples, in particular, require even less. Thanks to extensive self-diagnostics, in-the-field quality monitoring, and modular self-service hardware, all our machines are phenomenally reliable.

But in the event your Apples do need our attention, we've got just the program: our National Account Service and Support Program for Apple Personal Computers.

A package of innovative options that lets you pick and choose exactly what level and what kind of service and support you need — designed specifically for your business, corporation or profession.

EVERY APPLE COMES WITH A SET OF WHEELS.

Which means, if you desire, we'll come to you. It's all part of our nationwide Apple On-Site Service Program, provided in conjunction with the RCA Company.

Like all Apple products, Apple On-Site works simply. You call us. One phone number. Toll-free. We do the rest.

"The rest" entails having an RCA Customer Service Representative from one of the over 200 field offices come out to your office and solve your problem. Usually within the next half business day.

This partnership with RCA makes Apple On-Site one of the most experienced service networks in the business.

And just one easy-to-budget-for annual fee covers everything. There are no zone charges, no warranty or travel charges, and no minimum quantities. So you can get on-site service whether you have one Apple or one thousand.

LISA GETS LOTS OF ATTENTION.

The same toll-free number mentioned above puts users of the Lisa® Personal Office Systems in touch with specially trained Lisa experts who can answer application-related questions during the warranty period.

You can also get special application training on the Lisa. Courses follow a hands-on, self-paced format, and are taught by certified Apple trainers.

Both basic and advanced courses are available, either at your office or at selected Apple sites.

SYSTEMS AND PERIPHERALS

storage, and the M2233AT, 13.3M bytes of storage. Both drives are 1.62 in. high, and have Seagate Technology, Inc. ST506/412 compatibility.

In quantities of 100, the M2230AT drives are priced at $750 each, and the M2233AT at $850, according to the vendor. Evaluation units reportedly will be available during the first quarter of 1984.

Fujitsu, 3075 Oakmead Village Drive, Santa Clara, Calif. 95051.

COMPUTER STORAGE TECHNOLOGY, INC.
CS-100; TS-100

Computer Storage Technology, Inc., (CST) has announced a streaming tape subsystem for backup storage and an on-line operational magnetic tape subsystem for the IBM Series/1 minicomputer.

The CS-100 streaming tape subsystem provides up to 56M bytes of backup storage for large capacity Winchester disk drives, according to CST.

It reportedly uses the firm's CC-100 peripheral processor and a ¼-in. cartridge tape streamer based on the QIC-02 cartridge used by Archive Corp. Sidewinder or Cipher Data Products, Inc. Quarterback tape drives.

The tape subsystem can be mounted in a standard 19-in. rack, with no need for a software driver, diagnostic changes or controls, other than a power switch, according to a spokesman for the vendor.

The firm's TS-100 tape subsystem consists of a TC-100 peripheral processor, a universal users' adapter and up to four tape transports, the spokesman said.

It is said to be compatible with tape speeds from 12.5 in./sec to 125 in./sec.

It reportedly features switch-selectable address and density selection with quartz crystal generated timing in order to eliminate the need for controller adjustments.

Both subsystems are available 30 days after receipt of order, according to the spokesman.

The CS-100 costs $4,970. The price of the TS-100 depends upon the tape drive selected, ranging from $10,100 using the Kennedy Co. 9000 drive to $12,300 using the Kennedy 9300, according to the vendor.

Computer Storage Technology, 1269 S. State College Blvd., Anaheim, Calif. 92806.

TERMINALS

BARRISTER INFORMATION SYSTEMS CORP.
Attorney Workstation/Telephone

A combination computer workstation and telephone designed for lawyers and professionals is being offered by Barrister Information Systems Corp. for use with the Barrister Law Office Information System.

Comprised of a Northern Telecom, Inc. Displayphone, the Attorney Workstation/Telephone functions as a terminal on the Barrister system and as a telephone with special executive features, according to a spokesman for the vendor.

With the Displayphone, the attorney can inquire into the Barrister litigation support, information management and financial management data bases, as well as public information sources such as Dow Jones News Retrieval Service, *The New York Times*, Lockheed Dialog and Westlaw, the vendor spokesman said.

The system performs docketing functions and has a reminder service for key meetings that holds up to 58 entries one year in advance, the vendor said.

The Attorney Workstation reportedly features a 7-in. video display terminal, a retractable keyboard and a directory that stores as many as 81 numbers for automatic dialing.

The Displayphone is portable and can communicate to the Barrister system from any location through telephone lines, according to the vendor.

The Attorney Workstation/Telephone is priced at $1,995.

Barrister Information Systems, 45 Oak St., Buffalo, N.Y. 14203.

SYSTEMS AND PERIPHERALS

SYSCON CORP.
Veraterm

Syscon Corp. has announced a hand-held terminal with 64K bytes of programmable memory for data gathering applications.

According to a company spokesman, the Veraterm terminal weighs 1 lb and measures 3¼-in. by 7-in. by 1¼-in. It reportedly features 32 keys, including a shift key, for a total of 63 functions. A 2-line by 32-char. LCD, low-power microprocessor and rechargeable battery are also included.

The terminal can be programmed for a variety of tasks, such as collecting meter readings, gathering inventory of patient information, recording data for laboratory experiments, monitoring industrial processes and monitoring and scheduling maintenance, the spokesman said. Data reportedly can be loaded and unloaded from a variety of host computers through an interface and a battery-charging device that can accommodate eight terminals, the vendor said.

The terminal is available for $3,000, and the interface device is available for $6,000.

Syscon, 3990 Sherman St., San Diego, Calif. 92110.

HEWLETT-PACKARD CO.
HP 78532A

Hewlett-Packard Co. has announced an addition to its bedside patient monitoring family, the HP 78532A monitor/terminal.

Compatible with all HP medical equipment, the bedside terminal was designed to be an integral part of the HP Care-Net critical care local-area network.

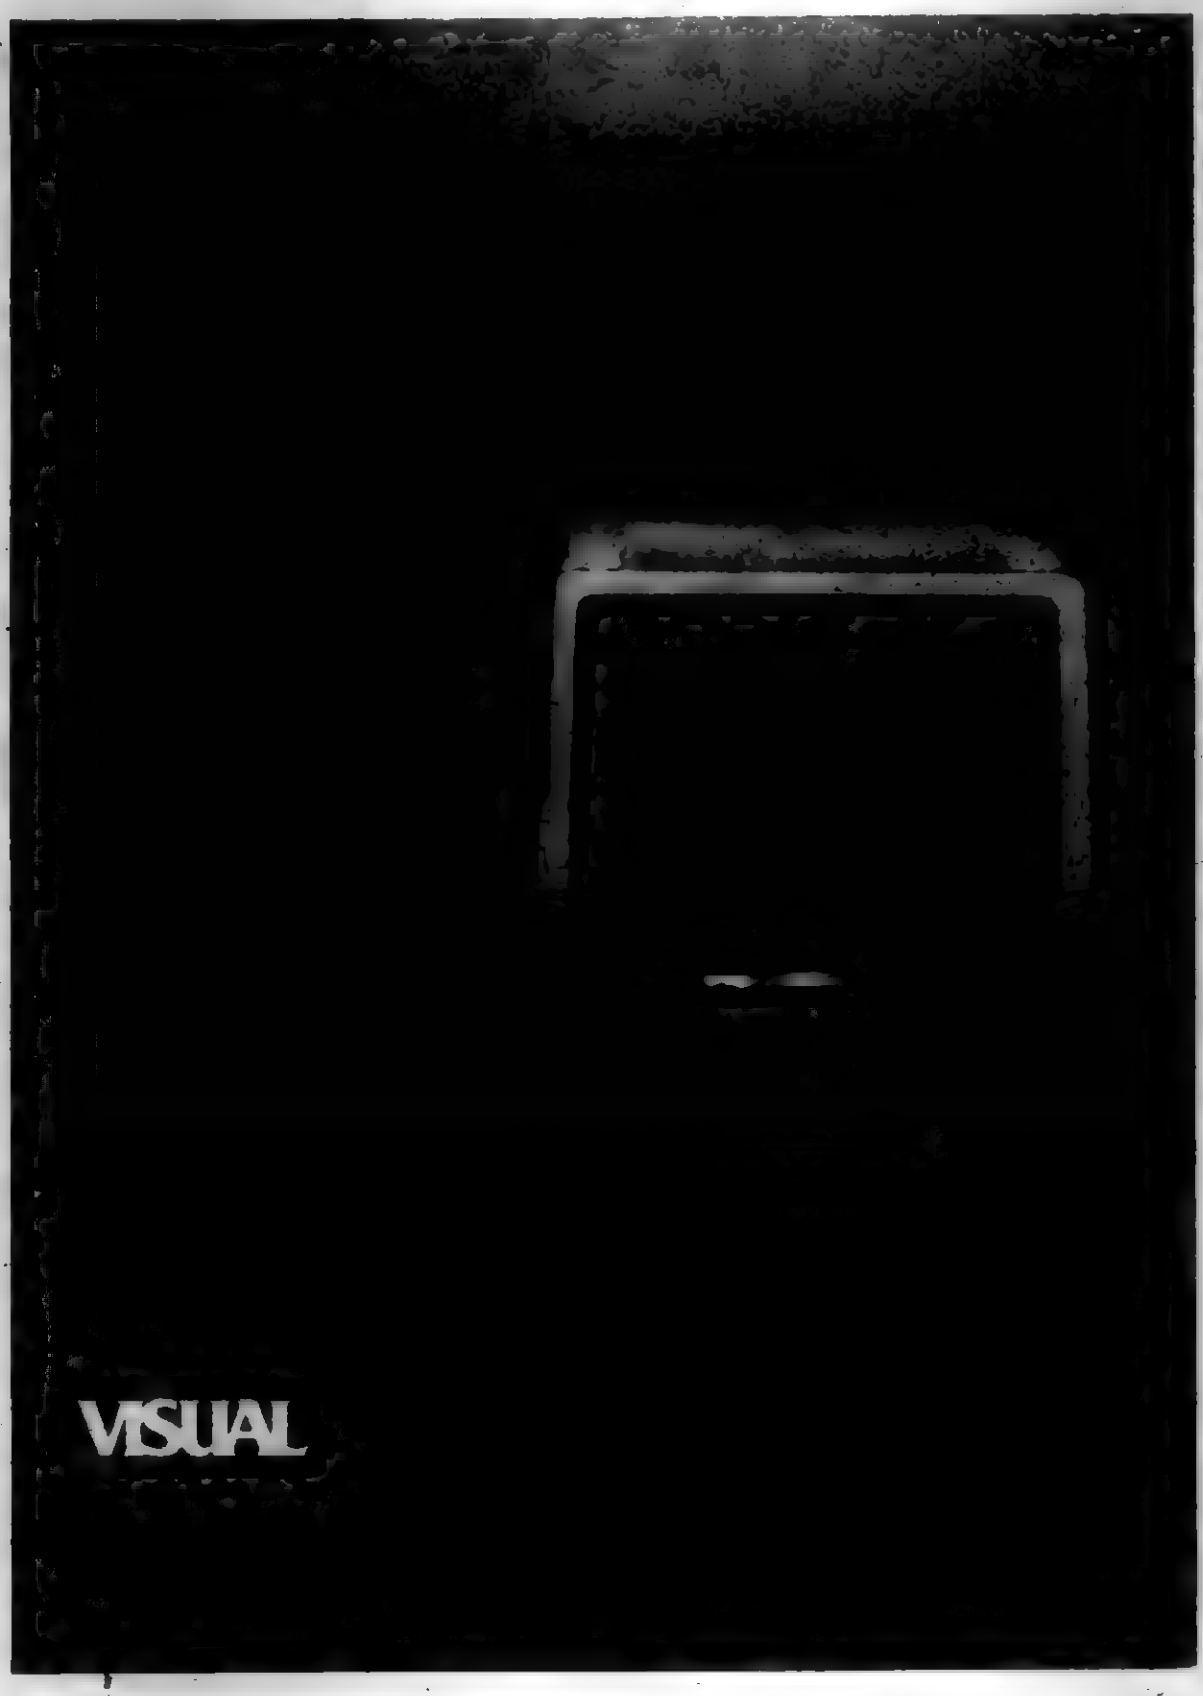
Standard measurements on the terminal/monitor include full-lead electrocardiogram, two pressures and one- and eight-hour trends. The expandable 16-bit microprocessor allows field-upgradable enhancements such as the cardiac output module, which provides cardiac output and blood temperature measurements, the vendor said.

The HP 78532A has an overview feature which allows the user to access the waveforms, vital signs and alarm messages of up to 24 patients. Overview is initiated manually or automatically during an alarm condition from another bed, the vendor said.

Buttons on the instrument panel provide access to critical or frequently performed tasks. A row of user-changeable function keys labeled on the video screen are for less critical functions. In addition, bedside information can be displayed in a variety of formats, the vendor said.

The HP 78532A monitor/terminal is priced at $7,540.

Hewlett-Packard, Medical Products Group, 100 Fifth Ave., Waltham, Mass. 02254.



HEWLETT-PACKARD CO.
Matrix and Line Printers

Hewlett-Packard Co. has announced four printers including three matrix printers and a system line printer that operates at 300 line/min.

The HP 2930 family of three character-sequential printers operates at 200 char./sec. Included in the family are a general-purpose printer and a remote workstation printer that can produce bar code and a letter-quality printer for business, technical, manufacturing or personal printing, the vendor said.

The unit's print head uses 12 wires arranged in two staggered columns. A last-form tear-off feature makes it possible to remove the last printed sheet of continuous paper without wasting a blank sheet, the company noted.

Users may choose 5, 10 or 16.36 char./in. printing and both serif and sans-serif fonts. Line drawing, math symbols and character sets in 10 languages are also standard.

Included in the HP 2930 family is the HP 2932A printer, which was designed for distributed printing applications. For data capture applications, the HP 2933A factory data printer features large-character generation and bar-code printing in several formats. The HP 2934A distributed office printer, designed for business and personal use, offers either a 40 or a 67 char./sec matrix, letter-quality print and 200 char./sec memo-quality printing.

All three printers are supported by the HP 150 and 200 personal computers, the HP 1000 and 9000 technical computers and the HP 250 and 3000 business computers. With RS-232C and Centronics Data Computer Corp. parallel interfaces, the printers are also compatible with many other systems.

The HP Series 300 Model 2563A system line printer provides 300 line/min printing for many types of business uses. Featuring compressed print, multinational and optical character recognition character sets, raster graphics and bar codes, the HP 2563A has noise-reduction features as well as paper-jam detection.

The line printer can link to HP 3000, 250 and 1000 computer systems through the HP Interface Bus and to a number of other systems through Centronics and Dataproducts New England, Inc. interfaces.

The HP 2932A, 2933A and 2934A matrix printers are priced at $2,495, $2,795 and $2,895, respectively. Replacement print heads are $140. The HP Series 300 Model 2563A line printer is $5,780, including power supply. OEM discounts are available.

Hewlett-Packard, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

MICROCOMPUTERS

The education of managers: getting them to use micros

By Anthony J. Faneel
Special to CW

First of a Two-Part Series

"What are those typewriter-televisions anyway?" is the question on the cover of Peter McWilliams' best-seller, *The Personal Computer Book*. What are they indeed. As businessmen all over the country hoped for a happy and prosperous 1983 to greet them last January, they were served a giant literary bromo as *Time* magazine named the personal computer "Machine of the Year."

Then just before the first-quarter numbers were being tallied and management had finally read the last chapter of Thomas J. Peters' and Robert H. Waterman Jr.'s *In Search of Excellence*, managers got another literary barrage. This time it was *Business Week's* turn: "The personal computer explosion is changing the organizational structure of companies as well as the function of managers."

The siege continued with headlines proclaiming "Chip Wars" and "Computer Shock." Amid this ever-increasing public computermania appeared the confident, almost smiling face of IBM Chairman John Opel on the cover of *Time* with the IBM logo in the background and the title "The Colossus That Works." The smile was probably due to IBM's record personal computer sales.

Uneducated on personal computer

It seems that these typewriter-televisions are everywhere. Yet most management personnel are uneducated on the personal computer, which has found its way into offices, small businesses, classrooms and homes.

There is a need for education on the use of personal computers in corporate business operations. "Not here," many managers say. "I conducted a personal computer session with my company's management. We brought them in for a demonstration, and [the managers] asked questions and seemed interested."

If that was education, the elementary school year could be shortened to one day by bringing in the students, working some math problems on the board, reading a short story aloud and discussing the significance of the Fourth of July. Clearly, that kind of brief exposure cannot be deemed sufficient education.

Picture an organization about to receive a powerful new method of processing one of its vital assets. The management would expect an in-depth review of the background of this new process, a review of its proven capabilities, examples of its use in other organizations and a brief conceptual review of how it functions.

There should be no difference in approach to the introduction of the concept of utilizing personal computers in corporate business operations. Information is certainly a vital asset of an organization and, therefore, the personal computer deserves the status of a powerful new method of processing. Typically, the management information systems function within an organization has the responsibility to encourage the proper use of personal computers and control the potential misuse of this new technology.

There are three parts to an educational seminar: format, content and delivery. Often, participants concentrate on the content of a seminar and either ignore until the last minute or spend very little time on the other two-thirds of the requirements of a successful seminar.

The audience for a management seminar on personal computers will require that the developer keep in mind the group's level of computer literacy, current perception of the personal computer and the main focus of the seminar.

A central theme for this kind of educational seminar should be to leave the participants with an understanding of what a personal computer can do, not how a personal computer works. Concept-oriented, nontechnical meetings of this kind have proven successful in introducing the personal computer in hundreds of organizational structures.

Computer literacy

Management education should include some computer literacy on the trends within the information industry and how the combination of the information center and the personal computer is making this step forward possible.

It is hard to dispute the astronomical success of personal computers which, according to an International Data Corp. projection, will surpass mainframes in 1987 in terms of dollar volume.

An explanation of the use of the personal computer as a management productivity tool is an excellent vehicle to stimulate the audience's interest in what functions it performs. New York-based Booz, Allen & Hamilton, Inc.'s study on knowledge workers — defined as management and nonmanagement professionals — is a revealing description of the highly interrelated work functions of this critical group of workers.

Next in the seminar should be a section focusing on the types of organizations that use personal computers as management productivity tools and the functions they perform.

Success stories

The data processing and non-data-processing publications are filled with success stories about time-saving management uses of personal computers. Best-selling books on the subjects of successful management and worldwide economic trends can provide plenty of material for this section.

Senior management of organizations that have made the commitment to use personal computers will likely say that they are preparing for the shift to a more service-oriented economy. The personal computer will assist their organizations in dealing with the need for timely information, which will be a requirement to perform efficiently and to compete effectively.

Computer technology will soon be used as a competitive weapon to fight the competition and to play a strategic role in the success of organizations. The best person to deliver this section is a member of a management team from an organization that successfully uses personal computers.

Faneel is president of Personal Computer Management, Inc. of Wheaton, Ill., a consulting firm that provides seminars on personal computers for managers.

Next week: software, modeling and graphics.

DEC unveils more software

MAYNARD, Mass. — A version of the P/OS operating system is among a series of software products announced recently by Digital Equipment Corp. for its Professional 300 series of microcomputers.

P/OS Version 1.7 includes performance and function enhancements, DEC said. It was designed to take advantage of increased memory and floating-point processing capabilities that are standard on all Professional systems. Its license is included in the system price. Media and documentation are sold separately for $175.

DEC's PRO/V7M is a complete Unix system for the Professional 300 series. It costs $695. ET-11 is DEC's single-user, real-time operating system designed to be operated on DEC's PDP-11 series, including the Professional 300. The single-user price is $700.

Softech Microsystems, Inc.'s UCSD P-system Version IV.1 can now be installed as an application on P/OS to provide a portable application software environment. It can be written in UCSD Pascal and Fortran 77. The price ranges from $250 to $975.

The PRO/Tool Kit was designed for use on the Professional 350. It is said to eliminate the need for a host system in Professional applications development and offers DEC RSX and VMS program development capabilities on the Professional 350. Licenses range from $295 to $495. The Professional Host Tool Kit Version 1.7 is an enhancement that provides improved performance and supports

See P/OS page 66

Apple enhances Apple III system

CUPERTINO, Calif. — Apple Computer, Inc. has announced an enhanced version of its Apple III business computer system and an electronic information service for Apple III owners.

The Apple III Plus system reportedly features an interlace video mode, which is said to double screen resolution of text and graphics, a clock/calendar function, an Apple IIe-style keyboard, revisions in the operating system and a reengineered main logic board.

The interlace video mode is said to scan both normal lines and between normal lines, giving the appearance of solid lines instead of dots. The clock/calendar function reportedly allows date and time stamps on files and tracking of sequences of events.

The keyboard reportedly is identical to the Apple IIe keyboard, featuring repositioned cursor control keys, a delete key and a choice of either Qwerty or Dvorak key layouts.

Revisions of the Sophisticated Operating System (SOS) 1.3 and system utilities are intended to support hardware changes that are said to include redesigned four-

new language and compilers, the spokesman said. It licenses for $4,000.

The Whitesmiths Ltd. C Compiler for the PRO/Tool Kit and the Professional Host Tool Kit supports the full C language and offers a library of support functions. It costs $550 for the PRO/Tool Kit and $1,100 for the Professional Host Tool Kit.

Application packages that are available include: PRO/Applications Starter Kit, an integrated package of business applications for computer novices, priced at $300; PRO/Datatrieve, an implementation of DEC's Datatrieve-11 interactive data management system for the Professional 350, priced at $495; Professional Inter-System Management, which enables a Professional under P/OS 1.7 to communicate directly with IBM mainframes, priced at $595; and RS/I, a new version of Bolt Baranek and Newmann, Inc.'s RS/1 Research System for stand-alone use on Professional 350s with hard disks and color monitors, priced at $1,900.

Other applications include: Maps/PRO Graphics, a business graphics system for the Professional 350 developed by Ross Systems, Inc., priced at $200; Mechanical Engineering TK! Solverpack, one of a series of applications packages used with Software Arts, Inc.'s TK! Solver that contains 13 general models for mechanical engineering, priced at $200 for TK! Solver, $100 for Mechanical Engineering TK! Solverpack and $100 for TK! Financial Solverpack; and Universal Microprocessor Development system from Boston Systems Office, an integrated development system that is compatible with more than 30 microprocessors. It is priced from $1,000 to $3,000.

Hardware announcements include a Real-Time Interface module option, which includes four I/O ports, allowing the Professional to communicate with and control passive data capture devices. It is priced at $595. Computing Terminal Interconnect licensing is no-charge licensing of the Professional's bus for third-party hardware vendors.

DEC, Maynard, Mass. 01754.

layer main logic board, peripheral ports on the back panel that use standard DB-25-pin connectors and modified slot housings for easier insertion of peripheral cards.

The Apple III+ system is now available for a suggested retail price of $2,995.

Apple Serve III is an electronic information service for owners of the systems.

Apple Serve III is said to feature an electronic mail connection among Apple III owners; a bulletin board for exchanging hardware and software tips; referrals and meeting information; an electronic newsletter produced by Apple; and information on software updates and directions for obtaining them.

The service is provided through the Compuserve, Inc. network. A modem and a telecommunications software package are required.

The service is available now for free, although, Apple said, there may be a charge at a later date.

Apple Computer, 10260 Bandley Drive, Cupertino, Calif. 95014.

SYSTEMS

WINTERHALTER, INC. Datataliker II

Winterhalter, Inc. has introduced the Datataliker II, an intelligent front-end processor which allows most popular microcomputers to access IBM and IBM-compatible mainframes and other communications networks.

The product is said to plug into a micro's RS-232 serial port. Using several software packages included with the product, the Datataliker II allows a microcomputer to emulate several different remote batch and interactive IBM terminal systems.

The software, currently available for micros running on Digital Research, Inc.'s CP/M, CP/M 86 and Concurrent CP/M 86 and Microsoft Inc.'s MS-DOS operating systems, reportedly allows the connected system to emulate the IBM 3271, 3275 and 3276 interactive terminals and the IBM 3780, 2780, 3741, 2968 and 2770 remote batch terminals.

The unit costs $995.

Winterhalter, 3553 Research Park Drive, Ann Arbor, Mich. 48106.

MULTITECH INDUSTRIAL CORP. Microprofessor MPF-III

Multitech Industrial Corp. has introduced the Microprofessor MPF-III, a microcomputer said to be compatible with the Apple Computer, Inc. Apple IIe.

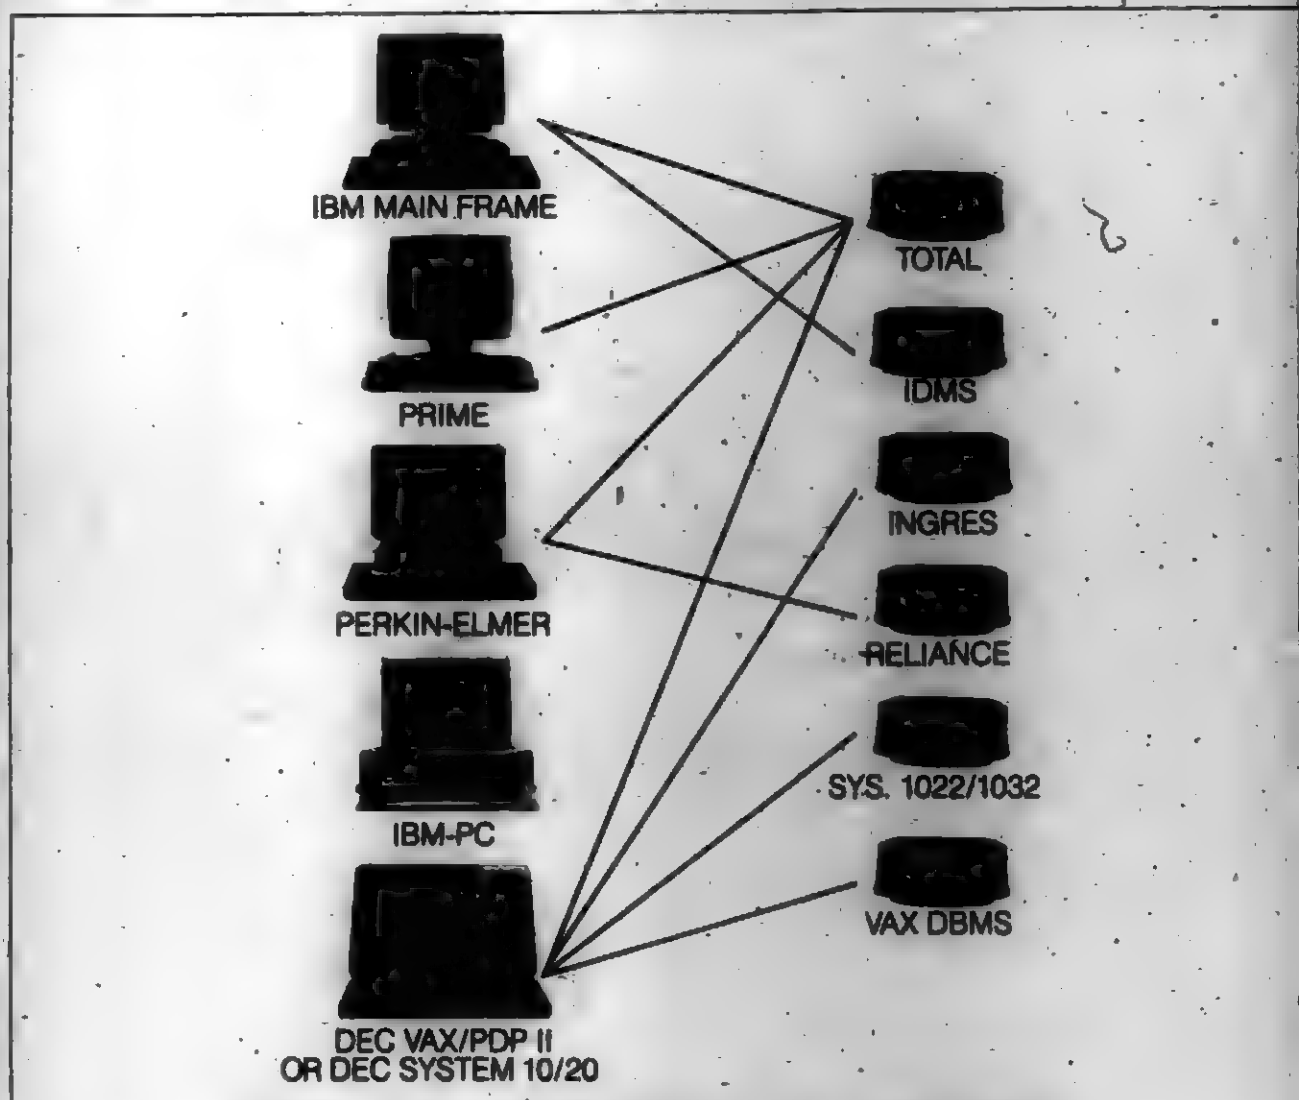
The MPF-III features 64K bytes of random-access memory (RAM) and 24K bytes of read-only memory. The vendor said 2K bytes of RAM function as a text buffer for an 80-col. screen feature.

Several standard expansion capabilities are available on the MPF-III including two monitors, cassette unit, a Centronics Data Computer Corp. printer and joystick interface. Optional expansion features include a floppy disk, RS-232C interface, a Zilog, Inc. Z80 microprocessor, Digital Research, Inc.'s CP/M and a Chinese character generation card.

The MPF-III comes with a 90-key detachable keyboard, the vendor said.

The unit costs $599.

Multitech Industrial, 315 Fu Hsing N. Road, Taipei 104, Taiwan, ROC.



MIX VS.

No DBMS matches SEED for transportability. No DBMS offers you a wider range of hardware options now and for the future. Whether you opt for DEC, IBM, Prime, Perkin-Elmer or GOULD CSD.

And SEED lets you transport applications across machines—micro to mainframe or the reverse. SEED also provides the only compatible path from DEC 10/20 to IBM and VAX.

Because SEED is so transportable, it enables you to standardize development efforts to increase programmer productivity. In short, SEED helps you get the most out of both your hardware and your human resources. And we back SEED with our own resources—a team of experienced professionals that gives you personalized, on-going support and service.

MICROCOMPUTERS

ONYX SYSTEMS, INC.
Price reductions

Onyx Systems, Inc. has reduced prices by up to 12% on several of its 8-bit microcomputer models. Price reductions range from $240 to $1,210 on the Onyx Sundance, C5001 and C8001 series processors.

With these reductions, the price of a Sundance II incorporating an 80-col. Digital Equipment Corp. VT100-type video display terminal, 192K bytes of random-access memory (RAM), a 7M-byte Winchester disk drive and tape backup is $7,250. The maximum configuration of the Sundance II, with 132-col. display, 192K bytes of RAM, a 21M-byte disk drive and tape backup, is priced at $9,750.

The price of the C5001A now ranges from $5,990 to $7,990. These systems include 192K bytes of RAM, tape cartridge backup and a choice of 7M-, 14M- or 21M-byte disk drives. The C5001/MU, which features 256K bytes of RAM and a 14M- or 21M-byte disk, begins at $7,990.

The C8001/MU begins at $10,990, supports five users and has 256K bytes of RAM and a 30M-byte disk.

Onyx Systems, 25 E. Trimble Road, San Jose, Calif. 95131.

STORAGE

QUALITY COMPUTER SERVICES, INC.
Bev, Big Blue

Quality Computer Services, Inc. has announced a 10M-byte, fixed, 5¼-in. Winchester hard disk subsystem said to offer an average data transfer rate of 5M bit/sec, an average latency time of 8.33 msec and a track-to-track seek time of 3 msec. The subsystem, Bev, is part of the vendor's family of 10M- to 84M-byte, 5¼-in. Winchester hard disk subsystems.

Also offered is Big Blue, a single-slot card said to run Digital Research, Inc. CP/M 80 programs on the IBM Personal Computer and the Compaq Computer Corp. Compaq without CP/M. Included with Big Blue are a Zilog, Inc. Z80B microprocessor; 64K-byte random-access memory; parallel and serial ports; serial cable; real-time clock; and hard disk interface. Bev costs $1,999 and Big Blue costs $595, the vendor said.

Quality Computer Services, 9 Quora Drive, Metuchen, N.J. 08840.

SEAGATE TECHNOLOGY, INC.
ST8100

Seagate Technology, Inc. has announced an 8-in. Winchester disk drive, reportedly designed for multiuser networking, graphics and shared-resource systems based on desktop supermicrocomputers.

The half-height ST8100 is said to feature reduced access time, 102.1M bytes of unformatted storage and a transfer rate of 10M bit/sec. The average access time reportedly is 30 msec, the vendor said.

Evaluation versions of the drive cost approximately $1,500. They are scheduled to be available in the second quarter of 1984, the vendor said.

Seagate, 920 Disc Drive, Scotts Valley, Calif. 95066.

BASF SYSTEMS CORP.
Storage media

BASF Systems Corp. has announced two media products, a 3½-in. micro diskette and a high-density 5¼-in. floppy disk.

The 3½-in. diskette has storage capacity of .5M bytes per side. The 5¼-in. floppy disk has a storage capacity of up to 1.6M bytes, the vendor said.

The price is $7.50 each for the 3½-in. diskettes and $10.00 each for the 5¼-in. floppy disks. These products will be available in the first quarter of 1984, according to the vendor.

BASF Systems, Crosby Drive, Bedford, Mass. 01730.

EICON RESEARCH LTD.
Discache

Eicon Research Ltd. has announced a Winchester disk subsystem for personal computers, reportedly featuring the ability to make frequently used data immediately available from a random-access memory (RAM) cache rather than from a disk.

The Discache subsystem is said to offer 10M- or 20M-byte formatted storage, a 256K-byte RAM cache memory, a microcomputer and an incremental backup system.

The product is available now at a suggested retail price of $3,000.

Eicon Research, 2157 Park Blvd., Box 60458, Palo Alto, Calif. 94306.

PRINTERS/PLOTTERS PERIPHERALS

COMPUTER STORAGE TECHNOLOGY, INC.
Model CS-400

Computer Storage Technology, Inc. (CST) has announced a microprogrammed magnetic-tape peripheral processor said to meet IEEE-696 standard for S-100 bus compatibility.

The Model CS-400 reportedly can record up to 55M bytes of data on a single ¼-in. cartridge and is capable of transferring data to tape at the speed of a streaming tape drive. The subsystem is comprised of a CST Model CC-400 single printed-circuit board peripheral processor, an Intel Corp. 8237 direct memory access (DMA) controller, a Zilog, Inc.

The right equipment in the right place is not enough.

Get the facts on training in Computerworld Office Automation this February.

This February, *Computerworld Office Automation* will give you a close look at a whole range of training methods to help you choose what's right for your users: traditional training classes, computer-aided instruction, vendor instruction, on- or off-site training—and lots more. We'll also include a survey of different methods users have tried—and the results.

You'll read about one user's experience implementing an electronic mail system and accounts of how four different types of OA managers are coping in a multi-vendor environment. In addition, you'll get the results of a reader survey on the difficulties in hiring qualified office automation staff so you'll know what to expect.

And that's not all. There'll be feature articles on:

- Using superminis in office automation
- The current state of decision support systems
- The four-phase evolution of integrated systems
- PBX technology
- The growing use of on-line databases in office automation

Computerworld Office Automation is designed to give you OA information geared to the DP/MIS environment—in a way that no traditional office publication can. As a *Computerworld* subscriber, you'll be getting six issues of *Computerworld Office Automation* in 1984—as part of your subscription! And if you've got users demanding training, you won't want to miss this first issue on training and implementation strategies.

If you've got office automation products our readers should know about, then you need to get your ad reservation in by January 6th. The materials are due one week later on January 13th. To reserve ad space in this February 15th issue of *Computerworld Office Automation*, call one of the sales offices listed below, or Ed Marecki, National Sales Director at 617-879-0700.

MICROCOMPUTERS

Continued from page 67

29088 peripheral processor for data transfer and a ¼-in. cartridge tape streamer based on the Qic-02 cartridge interface from Archive, Inc., the vendor said.

The peripheral processor is embedded in one slot of the S-100 host computer, while the streaming cartridge tape drive and power supply are contained in a tabletop chassis.

A basic CS-400 is available as a 45M-byte system (extendable to 55M bytes) with a full 20-bit DMA transfer capability and features 16-level DMA request arbitration along with 8- or 16-bit I/O address decoding, the vendor said.

A menu-driven software program provides use of Digital Research, Inc.'s CP/M and MP/M operating systems, the vendor said.

The price for a single subsystem is $2,995.

CST, 1369 S. State College Blvd., Anaheim, Calif. 92806.

ALPHACOM, INC.
Alphacom 42

Alphacom, Inc. has announced a price cut for its 40-col. home computer printer.

The Alphacom 42 universal printer, which reportedly uses a single-chip microprocessor and thermal technology, is said to operate at 2 line/sec and to feature bit-mapped graphics.

The unit is now priced at $79, plus $20 for an interface for most systems, according to the company.

Alphacom, 2323 S. Bascom Ave., Campbell, Calif. 95008.

BOARD-LEVEL DEVICES

ATRON CORP.
PC Probe

A hardware and software debugging tool for program development on the IBM Personal Computer and compatible systems has been introduced by Atron Corp.

Called the PC Probe, the device consists of a printed-circuit card that fits into any Personal Computer card slot, an umbilical cable and probe that plugs into the Personal Computer's 8088 integrated circuit socket and debugging software on a floppy diskette.

Designed for all standard high-level personal computer languages, including Macro Assembler, Pascal Compiler, Fortran Compiler and C Compiler, the PC Probe reportedly contains support for debugging both hardware and software.

Since it can access all Personal Computer bus signals as well as the 8088 CPU, Atron's tool can monitor and trap on interrupts and direct memory access requests as well as on standard CPU operations, the company noted.

Other features of the PC Probe include symbolic debugging capability, program patching, macro commands and program crash recovery, the vendor said.

The PC Probe sells for $2,195 in single quantities, with multiple quantity discounts available.

An optional eight-channel test clip cable costs $100, the vendor said.

Atron, 21075 Bank Mill Lane, Saratoga, Calif. 95070.

TEKPRINT, INC.
Print-It Model 2

Tekprint, Inc. has announced Print-It Model 2, a parallel printer interface for the Apple Computer, Inc. family of computers.

Featuring 64K bytes of internal read-only memory, 202 graphics modes, 25 text modes and seven format modes, the Model 2 is compatible with Apple II and IIe microcomputers and over 15 models of printers, the vendor said.

Print-It Model 2 is said to handle 40- or 80-col. text, a standard and alternate font, color or black and white, low- and high-resolution graphics, double high-resolution graphics and, on the Apple IIe, automatic selection of the proper print format to match the current display screen.

The Print-It Model 2 card, including handbook and printer cable, is available for an introductory price of $69, according to the vendor. Its retail selling price will be $174.

Tekprint, 8 Blanchard Road, Burlington, Mass. 01803.

ONE OF THE BEST BRAND NAME PRINTERS HAS A BRAND NEW NAME.

GENICOM

The General Electric 3000 family of printers has become an industry leading product. But now, this popular printer series has a new name, Genicom (the Data Communication Products Department of GE-its own independently owned company called Genicom).

At Genicom today we offer the same complete line of printers we offered while a part of General Electric. We have the same facilities, the same nationwide service network, and the same corps of experienced employees... only the name has changed.

Above all, Genicom offers you the same reliable product quality you've come to expect from us over the years. Our Genicom 3000 printers feature outstanding performance for end-users as well as superior flexibility for many OEM's, distributors, retailers and dealers. There are 3000 models with speeds from 45 to over 400 cps. Single or dual mode printing. Type quality from draft to NLQ. Multi-color printing. Graphics. Selectable type fonts. American craftsmanship and more. There are even 3000 family printers for personal computers... ideal for business needs.

We're proud of the exceptional brand reputation we established under General Electric. But now we're going to make a new name for ourselves by bringing you more innovations, and more of the reliable quality you've always found in each of our products.

Genicom Corporation, One General Electric Drive, Dept 18831, Waynesboro, VA 22980. In Virginia, call 1-703-949-1178.

MICROCOMPUTERS

ADVANCED LOGIC SYSTEMS
The Business Card

Advanced Logic Systems (ALS) has introduced an integrated package of hardware and software for the Apple Computer, Inc. Apple II family of microcomputers.

This package, called The Business Card, includes the vendor's T/Maker III software package and a circuit board offering Digital Research, Inc.'s CP/M Plus operating system.

T/Maker III is an integrated program that includes word processing, spreadsheet, list management and bar charting capabilities.

With this program, there is no need to transfer data between programs.

The Business Card is available for a price of $499.

The price of the standalone Apple CP/M version of T/Maker III is $275.

Current users of either the ALS CP/M Card or Z-Card can purchase T/Maker from ALS for $165.

ALS, 1195 E. Arques Ave., Sunnyvale, Calif. 94086.

INTELLIGENT TECHNOLOGIES INTERNATIONAL CORP.
Clusternet 3270

Intelligent Technologies International Corp. (ITIC) has introduced an enhancement to its PC Express communications package that it claimed will broaden the package's range of applications in IBM's Systems Network Architecture (SNA) environment.

Called Clusternet 3270, the new enhancement is said to be a printed-circuit board with SNA software that permits an IBM Personal Computer to serve as an IBM 3274 cluster controller linking as many as 12 Personal Computers with a mainframe.

The Clusternet 3270 board resides on a central Personal Computer, which is linked to the mainframe via a dial-up or leased telephone line and an external modem operating at 2,400, 4,800 or 9,600 bit/sec.

According to the vendor, the new package will be available for delivery in the first quarter of 1984 and is available as a standard feature of the PC Express with the SNA package, which is priced at $1,295.

ITIC, 151 University Ave., Palo Alto, Calif. 94301.

AUXILIARY EQUIPMENT

DUNCAN-ATWELL COMPUTERIZED TECHNOLOGIES, INC.
Lenipen/XT; Lenipen/Jr.

Duncan-Atwell Computerized Technologies, Inc. has announced color graphics systems for IBM microcomputer users, including artists, architects, computer-aided design and manufacturing engineers, doctors and graphics programmers.

The Lenipen/XT was designed for use with the IBM Personal Computer XT and XT/370 and compatibles.

A scaled-down version of the Lenipen/XT, the Lenipen/Jr., was designed for the IBM PCjr.

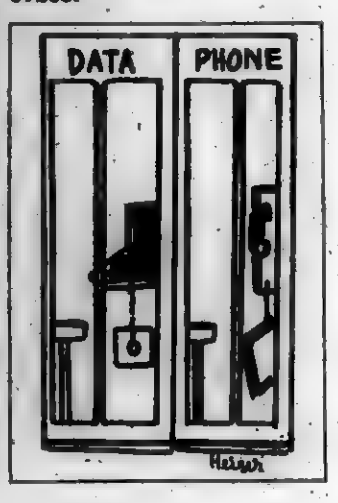
Both products are said to be direct derivatives of the vendor's Lenipen 1.0.

The products reportedly support various I/O devices, with light pens as the primary source of graphics input.

The vendor said the products provide for user logic programming, which allows the user to create a graphics image with a light pen, mouse or keyboard, while the system creates a Lenigram program of the image that can be saved and recalled.

The Lenipen/XT is priced at $695, and the Lenipen/Jr. is $345.

Duncan-Atwell Computerized Technologies, 1900 Salem Ave., Hillside, N.J. 07205.



COMPUTER INDUSTRY

Semi demand sign of times

INDUSTRY INSIGHT

BILL LABERIS

If you are interested in knowing just how vibrantly the computer industry will perform overall in the new year, look no further than the semiconductor sector.

Simply put, the companies that make the elemental pieces of computer systems massive and small generally cannot meet demand for their products now. The worst case (or best, depending on how you look at it) is given by the microprocessor makers, which in some cases will meet no more than 25% of the demand for their processing chips.

The pace of recovery in 1983 clearly caught the chip makers off guard, and thus they were slow in ramping up production, especially since most of them had reacted to the 1982 recession with layoffs. This, compounded by the fact that it takes about four months to produce a typical memory or processor chip, has sent many computer makers scrambling to find reliable second and third sources for key components.

But all too often in recent months computer makers have had to deal with the harsh reality that their components suppliers are just sold out, making promises of no better than six-month-plus lead times in many cases.

However, 1984 will likely witness a scenario wherein semiconductor supply finally catches demand, as production shortages abate and the industry settles into shipping about 3.5 billion chips per month — a full 60% above 1983 levels and nearly 200% above 1982 levels.

For system makers and end users alike, one result of this boom

Retail chains vary strategies

Few employ marketing plan aimed at big business

By Peter Burrill
CW Staff

Computer store chains are uniformly involved in a rapidly growing business, but the strategies employed by such chains to target their services to particular business markets are apparently quite varied.

Three nationally recognized chains of varying size were recently queried by *Computerworld* about strategies developed to target that segment of business represented by the Fortune 1,000 list. Only one company said it employs a specific strategy for targeting big business.

Contacted were officers of Computerland Corp., the largest computer store chain with more than 540 franchised stores open nationally; Entre Computer Centers, Inc., which has identified itself as the second largest chain with 100 stores already open and franchises granted for an additional 100 stores that are opening at the rate of 15 to 25 a month; and Byte Industries, Inc., an up-and-coming organization with 19 Byte Shop stores already opened and plans to expand its market with revenues from an anticipated public offering slated for this month.

Both Byte Shops and Entre first began franchise operations in 1982, although the original Byte Shop was opened in 1975. Computerland, which more than doubled sales volume to about $1 billion in 1983, was founded in 1976 and opened the first store in 1977. Entre posted $23 million in sales to franchisees in 1983, up from $687,444 during its first year of operations; Byte Industries would not comment on sales volume because of the pending offering.

"We are not a home computer retailer," declared Entre's advertising director Michael H. Savage during a recent interview. "We are concentrating almost entirely on business, including small business, professionals and corporations."

Entre, with an estimated 50% to 60% of its sales going to big business, was the only chain with a specific strategy for gaining a foothold in the corporate marketplace. Entre also recently announced a public offering, with revenues to be used for "general corporate purposes."

Byte Shops, according to President David Pava, have a three-pronged marketing approach aimed at the "high-end home use," personal productivity applications in all types of businesses and specific vertical market applications in which it intends to be

See RETAIL page 80

National Semi reports strong gains

SANTA CLARA, Calif. — Reflecting the continued boom in demand for micro circuits of all types, National Semiconductor Corp. reported strong quarterly gains in sales and profit as well as record-setting order rates.

For its second quarter, the company posted sales of $369 million, a 33% increase compared with the same period a year earlier. Profit in the quarter totaled $13 million, or 15 cents per share, compared with a loss of $3.5 million in the second quarter a year ago.

Commenting on National Semi's performance, Charles E. Sporck, president and chief executive officer, said both the company's components and systems divisions showed continued bottom-line improvement.

In addition, Sporck reported that capital spending in the first six months of fiscal 1984 jumped 38% to $83 million, with total capital spending for the year expected in the $200 million range, compared with $131 million in fiscal 1983. A significant portion of the current capital outlays will be directed at increasing current wafer fabrication capacity, including the construction of a new plant in Arlington, Texas, and a new research and development center here.

"Our goal," Sporck said, "is to expand fabrication and assembly capacities to meet current and projected growth in demand."

Stanford gets grants to study link between languages

By Robert Batt
CW West Coast Bureau

PALO ALTO, Calif. — Grants totaling $21 million have been awarded to a group of computer scientists, philosophers, logicians and linguists at Stanford University in an attempt to create a breakthrough in man's understanding of the link between natural and computer language.

The grants, made by the System Development Foundation of Palo Alto to the Center for the Study of Language and Information, will extend over four years and will eventually sponsor research by almost 100 professors, postdoctoral students and researchers from Stanford, SRI International, Inc. and Xerox Corp.'s Palo Alto Research Center (Parc).

"The purpose of the project is to take the body of insights into language from linguistics, logic, philosophy and the humanities together with the new challenges posed by computational languages and develop theories adequate to both," according to Jon Barwise, who is director of the Center for the Study of Language and Information.

Through their studies, the researchers have developed a new view of language, Barwise said. This view is that language and computation are two sides of the same coin. Central parts of the study of language and of computer science make up a single subject matter, which they have termed "situated language."

Terry Winograd, a professor of computer science at Stanford, said, "It is not our goal to create new applications, rather it is to establish theories essential to the design of computers and, by bringing people together from different disciplines, to create a body of knowledge that will allow us to lay the foundation for a whole new discipline."

According to the researchers, situated languages include natural languages like English and Chinese as well as computer languages such as Pascal and Lisp. This view of language centers on three complementary insights: that natural language use is fundamentally computational, that computational practice is fundamentally linguistic and that understanding linguistic activities in any real situation requires theories based on solid semantic foundations, theories that connect computation and language with information from the world.

"This theoretical framework will be the basis not only of a deeper understanding of natural language and computation, but the basis for practical developments involving the interaction of computers and humans," the researchers noted in a paper to the foundation.

Truth not absolute

These theories, Winograd claimed, challenge traditional logic by asserting that the truth of any statement is not absolute, but is related to the context, or situation, in which it is made.

Charles Smith, director of programs for the foundation, claimed, "This notion is central to making computers work intelligently."

The research at the Stanford campus has been going on informally for the past two years.

Brian Smith of Xerox's Parc has taken the group's ideas to develop the 2-Lisp and 3-Lisp computer languages, which reportedly enable computers to ask questions of themselves about their own state, a capability known as the power of reflection.

The Stanford research will be supported by more than 100 Xerox 1108 Dandelion workstations, three Digital Equipment Corp. VAX-11/750 superminis and a DEC 2060 mainframe. The systems will be tied together by Xerox's Ethernet local-area network.

HIGH PERFORMANCE

NOW AVAILABLE IN A THREE-SPEED

INTRODUCING THE NEW DS 220 MULTI-MODE MATRIX PRINTER

First there was the Datasouth DS180. The original high-performance printer. The printer that raised the standards of on-the-job performance to new heights. A tough act to follow.

And now, following in the same tradition, is the new Datasouth DS220. State-of-the-art performance, taken to higher levels. In a new 3-speed multimode form. Ready to run data, near letter quality and graphics output—in a single printer.

At data speed, the Datasouth DS220 leaves competitors in the dust. By using high speed tabbing to zip over blank spaces and true logic seeking to print the next available character, the Datasouth DS220 charges through printed copy at speeds rivaling more expensive line printers.

At 40 CPS NLQ speed, the Datasouth DS220 creates near letter quality output with the kind of class that might make you wonder if it was produced by a daisy wheel printer. With its fine tuned 18 x 48 dot matrix, multiple fonts are produced with the precise clarity required for word processing applications.

And for graphics, the Datasouth DS220 adds high performance style to popular microcomputer applications programs through high resolution dot addressable output. Sharp new details emerge from business charts and graphs, and engineering drawings.

And those are just its printing capabilities. Its fully instrumented dashboard allows push button programming of up to fifty features for forms control, communications and print style selection.

Best of all, the Datasouth DS220 costs much less than you might expect for a high performance three speed. Go to your nearest showroom and run a Datasouth DS220 through the gears. See how little it costs to own three high performance printers in one high performance package.

U.S. high tech must return to basics: panel

To restore reputation as world leader

By Robert Batt
CW West Coast Bureau

PALO ALTO, Calif. — U.S. high-technology industries will have to get back to basics if they are to restore their reputation for world leadership, according to John Young, president and chief executive officer of Hewlett-Packard Co.

Speaking at the second meeting of the recently formed President's Commission on Industrial Competitiveness, Young, who was appointed by President Reagan to chair the commission, said there are no quick fixes to the malaise affecting many of the nation's economic sectors.

At the same time, Young said, the commission's view is that U.S. industry does not suffer from an incurable disease, but is rather in need of vigorous rejuvenation.

"In dealing with the questions of industrial competitiveness, I tend to concentrate on fundamentals such as capital resources and trained manpower," Young said.

"Without the fundamental ingredients, we cannot stay in the competitive race and, so, returning to the basics is the business now facing the nation," Young told a press conference following the commission hearing.

Young said the commission, charged by Reagan with reviewing ways to increase competitiveness, especially in high technology, will make specific proposals during the course of its deliberations before issuing a final report by December 1984.

"Our aim is to look for specific areas that can make a difference in some measure to creating a forward motion that over time can have a considerable impact," he said.

Budget deficit

Also at the commission hearing, John Ong, president of B.F. Goodrich Co. and co-chairman of the commission's subcommittee on international trade with Robert Noyce, vice-chairman of Intel Corp., admitted that the commissioners are unlikely to come up with proposals that sharply increase the administration's controversial budget deficit, currently approaching $200 billion.

"We are trying to avoid being just another advocacy group, with a list of proposals that do not take account of current realities," Young added.

Ong stressed the commission's goal was to identify public policy areas in which it can recommend government action, for example, tax credits or propose congressional legislation to deal with a specific problem.

"The more carefully thought out our proposals, the more effective we will be as a commission," according to Ong.

In his presentation to the commission, David Crockett, president of Dataquest, a Silicon Valley, Calif.-based market research firm, said Japan will continue its dominance in many areas of the semiconductor market.

In the area of 256K-byte dynamic random-access memory (RAM), he contended, the major Japanese manufacturers, such as Hitachi Ltd., Fujitsu Ltd., Nippon Electric Co. and Toshiba, will ship around 14 million units this year, compared with 800,000 in 1983.

Crockett estimated Japan's share of the immature dynamic RAM market at 76%. "In the 1980s, the technology thrust will shift from dimension reduction to applications," he told the commission.

Commission members include several high-level industry figures, such as Mark Shepherd, chairman of Texas Instruments, Inc., and Noyce; respected academics, such as Michael Porter, professor of business administration at Harvard University; and government officials, including George Keyworth, science adviser to the president.

Among the areas being investigated by the commission are capital resources, research and development, manufacturing, human resources, international trade and industrial strategy.

IBM, Syracuse enter AI pact

SYRACUSE, N.Y. — Syracuse University and IBM have entered into a multiyear cooperative research program designed to broaden artificial intelligence (AI) development efforts, the university announced recently.

IBM will provide a 4341 mainframe, as well as an assortment of minis, personal computers and terminals, with Syracuse University providing the research staff to develop and implement AI capabilities for IBM's systems.

The research will be conducted in four areas. The first two research projects will concentrate on enhancing existing AI languages; the other two research projects will concentrate on developing an expert system to assist users in accessing a computer system.

Sperry comments

Clarification: In response to an industry analyst's claims about Tandy Corp.'s Model 2000 microcomputer [CW, Dec. 26/Jan. 2], a Sperry Corp. spokesman acknowledged the Tandy machine's edge in processing speed, but credited his own firm's micro with providing superior IBM compatibility. The Sperry comments were received after press time.

Anacomp defaults on lending agreement

INDIANAPOLIS — Financially troubled Anacomp, Inc. has defaulted on portions of a $45 million lending agreement with several of its creditors as efforts to reach a refinancing agreement have failed.

According to company officials, Anacomp did not honor all conditions of loans made to it by Chase Manhattan Bank and Manufacturers Hanover Corp. in New York, Bank of America in San Francisco, Fletcher National Bank in Indianapolis and Lloyds Bank International Ltd. of London.

The systems integrator and software house has suffered losses in excess of $16 million in its last two reporting quarters, with substantial losses anticipated in the quarter ended Dec. 30. The company had been mentioned as a possible merger candidate [CW, Nov. 28].

To counter its losses, which were due in large part to delays Anacomp has experienced in marketing a banking software program, the company has reduced its work force by about 10%, or 220 workers, and cut salaries companywide.

The company has also resigned in capital spending and ceased dividend payments.

Meanwhile, Anacomp is seeking to spin off its data services business to raise capital.

Market research firm offers subscription plan

ROCKVILLE, Md. — A computer market research firm has announced the availability of a subscription program for clients wishing to sell information and telecommunications technology and services to the federal government.

Input claimed its Federal Information Systems and Services Program provides information on executive agencies' expenditures for automated data processing and telecommunications through 1990.

Input said that the program interprets the government's procurement plans for use by companies in their planning processes.

According to Input, the procurement plans of government executive agencies are public information, but often use reporting techniques that obscure the size of acquisition programs.

Thus, Input said, the list of major systems acquisitions published by the U.S. Office of Management and Budget, General Service Administration and National Bureau of Standards is incomplete.

More information on the program is available from Input, located at 11820 Parklawn Drive, Rockville, Md. 20852.

MicroAge
"BECAUSE WE COULDN'T AFFORD MISTAKES!"
"They guided us over the rough parts when we needed it"
"During September of 1982, we started our MicroAge Computer Store in Tulsa, Oklahoma with 3 people. Today we have 11 people working for us and we're still hiring. By following MicroAge's advice and marketing strategy when we started in business, we were able to reach Tulsa's business computer buyers in a much shorter time than we could have on our own."
"Both of us had technical backgrounds in computers but lacked the marketing experience necessary to reach our goals. We used MicroAge's experience and leadership to guide us through the rough spots and boost our sales and marketing potential.
"MicroAge . . . they helped us build a sales organization to reach the Oklahoma businessmen."

THE LIBRARY OF COMPUTER AND INFORMATION SCIENCES

Please accept my application for trial membership in the Library of Computer and Information Sciences and send me the AUERBACH DATA PROCESSING MANAGEMENT LIBRARY (34929) billing me only $2.95. I agree to purchase at least three additional Selections or Alternates over the next 12 months. Savings range up to 30% and occasionally even more. My membership is cancelable any time after I buy these three books. A shipping and handling charge is added to all shipments.

No-Risk Guarantee: If you are not satisfied—for any reason—you may return the AUERBACH DATA PROCESSING MANAGEMENT LIBRARY within 10 days and your membership will be canceled and you will owe nothing.

Indispensable at $79.60
Incredible at $2.95

Take this comprehensive 8-volume Auerbach Data Processing Management Library for just $2.95 when you join the Library of Computer and Information Sciences

Specialization.

It's a worrisome burden for computer professionals.

Not only do you need specific technical expertise, but you have to know how to use it in support of business objectives and goals.

For more than 25 years Auerbach has served the information needs of computer professionals, assisting them to increase their effectiveness and enhance their careers.

That's why the Auerbach Data Processing Management Library has become an indispensable tool for every data processing professional.

These eight volumes are published at $9.95 each and cover all the specifics of Data Processing Management:

1. Data Processing Management. Long Range Planning Policies and Procedures. Decentralized Computing. Systems Implementation. Selecting Software Packages. Structured Techniques. **$9.95**

2. Computer Programming Management. Estimating Software Costs. Designing Modular Programs. Decision Tables. Acquiring and Approving Programmers. Testing. Program Maintenance. **$9.95**

3. Data Communications Management. Communications Technology. Formulating Network Requirements. Data Security. Disaster Recovery Planning. System Network Architecture (SNA). Digital Communications. **$9.95**

4. Data Base Management. DBMS Implementation Planning. Data Base Design. Distributed Data Bases on Unlike Computers. Case Studies. **$9.95**

5. Systems Development Management. Organizing for Project Management. User-Oriented Systems Analysis and Design. Using a Systems Consultant. Evaluating Software Packages. Structured Walkthroughs. **$9.95**

6. Data Center Operations Management. Documentation. Career Planning in Operations. Developing a Scheduling System. Evaluating and Negotiating with Vendors. Selecting Data Security Software. **$9.95**

7. EDP Auditing. Defining Objectives. Writing Audit Reports. Cost/Benefit Review. Test Design for Systems under Development. Application Programs. Auditing Microcomputer-Based Systems. Hardware Acquisition. **$9.95**

8. Distributed Processing Management. Establishing Controls. Operational Costs. Information Confidentiality. User Chargeback Procedures. Protocols and Compatibility. **$9.95**

The Library of Computer and Information Sciences is the oldest and largest book club especially designed for the computer professional. In the incredibly fast-moving world of data processing, where up-to-date knowledge is essential, we make it easy for you to keep totally informed on all areas of the information sciences. In addition, books are offered at discounts up to 30% off publishers' prices.

Begin enjoying the club's benefits today!

Complete in 8 comprehensive softbound volumes

The Auerbach Data Processing Management Library...

- **8 comprehensive volumes**
- **Over 1,200 pages of text**
- **More than 100 major topics**
- **104 contributing authors, each an experienced data processing practitioner**

4 Good Reasons to Join

1. The Finest Books. Of the hundreds and hundreds of books submitted to us each year, only the very finest are selected and offered. Moreover, our books are always of equal quality to publishers' editions, never economy editions.

2. Big Savings. In addition to getting the AUERBACH DATA PROCESSING MANAGEMENT LIBRARY for only $2.95 when you join, you keep saving substantially—up to 30% and occasionally even more. (For example, your total savings as a trial member—including this introductory offer—can easily be over 50%. That's like getting every other book free!)

3. Bonus Books. Also, you will immediately become eligible to participate in our Bonus Book Plan, with savings up to 70% off the publishers' prices.

4. Convenient Service. At 3–4 week intervals (6 times per year) you will receive the Book Club News, describing the Main Selection and Alternate Selections, together with a dated reply card. If you want the Main Selection, do nothing and it will be sent to you automatically. If you prefer another selection, or no book at all, simply indicate your choice on the card, and return it by the date specified. You will have at least 10 days to decide. If, because of late mail delivery of the News, you should receive a book you do not want, we guarantee return postage.

If the reply card has been removed, please write to: **The Library of Computer and Information Sciences, Dept. 7-CCI, Riverside, N.J. 08075** to obtain membership information and an application.

Computerworld 1/30

Market for portables still strong but fragmenting

By Bohdan S. Szuprowicz
Special to CW

The so-called portable computer is fast becoming the most talked-about variant of the personal computer revolution. But what is not entirely clear is that some of the portable computer promoters are also getting carried away with a lot of very heavy media hype not unlike that which preceded the home computer shakeout of recent months.

The portable computer market is also splintering rapidly into several segments, including desktop, suitcase (transportable or luggable), briefcase and notebook categories. Some analysts also throw hand-held computers into what is sometimes dubbed the "mobile" computer products group.

All this only further confuses the end users and investors alike who are still trying to recover from the shock of the rapid demise of Osborne Computer Corp. after its spectacular rise to portable computer pioneering preeminence in just two years.

Optimistic Forecasts

Despite that bankruptcy, market forecasts suggest that during 1982 nearly $300 million in portable computers were sold, primarily in the U.S., which so far accounts for 90% of the market. For 1983, this market will likely increase more than 200%.

In the longer run, a tenfold increase in the sales of portable computers is seen within the next few years, and between 20% to 25% of all microcomputers in use by 1987 are expected to be in that category.

Whether or not portables will remain similar to those now capturing the imagination of end users is another matter.

Chances are that technological developments are so rapid and competition so fierce that new, much more portable computer products will be thrown at users at an ever-increasing pace for the conceivable future, making existing models obsolete almost overnight.

Transportable Variety

So far the bulk of portable computers is of the transportable, suitcase-size variety, weighing from 18 to 40 lb and being no more portable than the average home TV set. Studies show that up to 80% of those machines are never moved and that they are used mostly in business applications, as they are cheaper than standard desktop units that would otherwise be used. Due to strong initial sales, Osborne dominates market share, followed by IBM-compatible maker Compaq Computer Corp.

The next supplier with a reasonable market share thus far is Inbytec Corp. of Canada, whose Hyperion has about 5% of the total. The remaining 25% of the market is being split by at least two dozen firms that have since entered the business.

What few outsiders realize, however, is the fact that the market for these relatively heavy portables has already peaked and is being overtaken by lighter, cheaper and almost equally powerful briefcase portable computers.

Some of these are sufficiently compact that you may be tempted to take one with you even when you are almost sure that you will not need to use it. That is the true test of portability in computers.

Notebook Portables

Even more convenient are the notebook portable computers, which are under 6 lb in weight, although their capabilities today are still somewhat limited.

But rapid developments in custom very large-scale integration microchips and solid-state memories as well as low-power, flat panel displays guarantee a veritable flood of new portable designs, and current product life cycle is seldom more than two to three years at best.

Perhaps the best indication of future trends is the fact that current portable computer market leaders Kaypro, Inc. and Compaq are already rumored to be working on briefcase, lightweight portables presumably of the 16-bit IBM Personal Computer-compatible variety. This is significant in that both companies increased their sales dramatically during 1983. Kaypro posted a 1,400% revenues increase to more than $75 million and promptly went public at $10 per share as soon as it became profitable.

Rising Revenues

Compaq's revenues rose spectacularly from $4.8 million the first quarter of 1983 to $18.1 million in the second and $36 million in the third, when the company became profitable.

Compaq has been very well financed with almost $30 million in venture capital and is already rushing to go public, registering six million shares for sale last October.

But at the time Compaq also stated that its backlog for deliveries through the fourth quarter of 1983 was only $40 million. This suggests that while the company may indeed do $100 million of business in 1983, the explosive revenue growth period may be over.

Rapidly growing competition is not the least factor affecting such growth. Anderson-Jacobson, Inc.; Columbia Data Products, Inc.; Computer Devices Corp.; Corona Data Systems, Inc.; Dynalogic Information Technology Corp.; Eagle Computer, Inc.; and Seequa Computer Corp. are all now in the market with 16-bit IBM Personal Computer-compatible transportable computers of the same category.

Szuprowicz is president of 21st Century Research of North Bergen, N.J.

Here are a few good reasons why you should make Local Data your protocol converter company.

Local Data's comprehensive line of local and remote protocol converters have been used around the world to make async-to-IBM communications simple and economical.

DATALYNX™/3274.
DataLynx™/3274 remote async ASCII protocol converter supports SNA/SDLC or BSC protocols. 80 types of ASCII async terminals can emulate IBM 3278 display stations. RS-232C ASCII async printers can emulate IBM 328X printers.

DATALYNX™/3780.
DataLynx™/3780 async ASCII-to-IBM 3780, 2780, 2770 and 3741 protocol converter supports EBCDIC BSC protocol on one channel and async ASCII devices on the other two channels. Features include transparency, mini/micro support and free file transfer program.

INTERLYNX™/3278.
InterLynx™/3278 allows the attachment of low-cost ASCII CRT terminals or p.c.'s to 3274/3276/4701 and 43XX integrated adaptor Type "A" coax ports. InterLynx/3278 enables the user to use async CRT's on IBM systems and switch to async applications under terminal control.

FILELYNX™/3278.
For micro-mainframe file transfers.

INTERLYNX™/3287.
InterLynx™/3287 allows attachment of ASCII printers to IBM Type "A" coax ports or 3274/3276/4701 controller and 4321/4331 CPU's.
SNA LU1 SCS and LU3 capability are standard with the InterLynx/3287. Features include parallel and serial ports and front panel set-up.

"Your Lynx to IBM."

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle—and makes it all easy.

Informatics just broke the productivity barrier with MARK V, an extraordinary timesaving application development system. But, MARK V is not for everyone. *It may be for you if:*

- ☑ You need help in reducing your backlog of medium to complex CICS applications.
- ☑ You use CICS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means with MARK V your programmer need only specify the solution. MARK V generates the complete application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—and that saves you money!

Reserve your free demonstration of MARK V—the simple new way to develop and maintain your medium to complex CICS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll schedule your *free demonstration* as quickly as we can. Remember, however, that interest in MARK V is unusually high. Scheduling is on a "first come" basis. So mail the coupon or call *today*.

To see MARK V CICS for yourself, mail the coupon or call toll free

DEMAND

from page 71

should be the ability to manufacture and market the next generation of memory chip — the 256K-byte random-access memory — a little more quickly than had been predicted. Right now, Texas Instruments, Inc. is passing out samples of its 256K-byte version; Intel Corp. and National Semiconductor Corp. will do the same in the first or second quarter of this year; Motorola, Inc. will be sampling in the second half of the year; and Advanced Micro Devices, Inc. should join the pack in early 1985.

In addition, greater sales and profits will yield greater research and development and capital investment dollars, making possible the first shipments of a 1M-bit chip by as early as 1986.

These and other key bits of semiconductor data have been made available by semiconductor management, which heretofore had been somewhat closemouthed.

■ Depending on whom you believe, it was either an administrative foul-up, a misunderstanding of commonly accepted protocol or a miserly act of Scroogian proportions.

But whatever the case, a lot of trade press and business press people were a bit upset with AT&T when the communications behemoth declined to pick up the luncheon tab for the press when company chairman Charles Brown spoke to the New York Security Analysts Society just before the holidays.

How upset? Given the then-announced demise of Western Electric Corp. and the impending Jan. 1 divestiture, Brown's appearance would ordinarily have drawn legions of media types. Perhaps a half-dozen actually showed up.

It wasn't the $20 luncheon fee that scared them off. The press simply does not pay to cover a news event. This long-standing practice made particular sense in this case, a luncheon for a $100 billion company featuring its chairman, whose intent was to take the podium and hit home-run balls. And the press wasn't allowed in without paying for lunch.

As a rule, according to the Analysts Society, the guest company picks up the press tab, no questions asked. Prior to its luncheon, AT&T reacted to the press protestations by saying it would have been silly for the company first to be invited to lunch, then to have to pay for a portion of it, albeit a very small portion.

Eventually AT&T saw the error of its ways and held a hastily called press conference the morning of the luncheon. The press conference was free of charge.

However, one attendee mentioned something about a collection plate next to the press table.

RETAIL

from page 71

come the "total solution" stores for specific markets. Big business, per se, has "not been identified as a specific group that we are going after.

At Computerland, according to Vice-President Don McConnell, the specific marketing strategy is to "support the franchisees' marketing efforts for whatever segment they are targeting. To the extent that they seek the Fortune 1,000 companies, we support them with products, training and customer support."

To that end, McConnell added, Computerland offers franchisees its Class program — Computerland Large Account Support Service — to assist in negotiating large account customers and providing ordering and invoicing services.

The benefit of dealing with computer stores for big business rather than a vendor's direct sales force, according to Entree's Savage, is that "a prospect is not locked into a single brand." Entree offers a mix of several popular micro brands and "has a very strong value-added concept." By offering servicing, training, education and support, he added, "we just don't sell them a piece of hardware and kick them out the door."

AT&T to aquire 25% of Olivetti

NEW YORK — In a move designed to power a major thrust into the European computer market, AT&T agreed just before the year-end holidays to pay $260 million to acquire 25% of Italy's Ing. C. Olivetti & Co. AT&T maintained an option to increase that stake to 40% after four years.

The deal involves the purchase for cash by AT&T of 100 million newly issued Olivetti shares sometime during the first quarter of this year.

Under the terms of the agreement, Olivetti will begin distributing AT&T's products, including switching equipment, private branch exchanges, software and microprocessors. AT&T, however, has made no agreement as of yet to distribute Olivetti's office automation products in the U.S., a market in which Olivetti is not a major player. Such an agreement is being negotiated, AT&T said.

In general, analysts felt that Olivetti's European market presence would be a major boon to AT&T in that sphere, while AT&T's financial backing and tech support would yield the greatest benefits to Olivetti. AT&T has a limited communications presence in Europe, due largely to the state-controlled communications systems in many European countries.

THE LEADING EDGE OF MINI

It's been going on for years.

Somebody comes out with a grown-up version of last year's mini. It sets a new standard of performance. So the whole industry follows along.

Not to be outdone, somebody else sets a new standard for price. And everybody rushes to catch up all over again.

There's only one little problem. So far, nobody's ever given you leading edge performance and a hot new price on the same system.

Well, at Wicat, we took a good hard look at this particular kind of progress. And headed 180 degrees the other way.

Instead of parading out one grown-up mini after another, we created the first generation of grown-down mainframes.

There are seven of them in all, from a single-user desktop to a full-blown 48-user system. And from the bottom of our line to the top, we'd like you to compare our price/performance

COMPUTER INDUSTRY

EXECUTIVE CORNER

■ Herbert M. Shaener has been named vice-president and general manager of the new Desktop Division of Data General Corp.

■ Michael Barber has been named vice-president, manufacturing operations, at Micom Systems, Inc.

■ David J. Stewart has been promoted to vice-president, development programs, for the System Sciences Division of Computer Sciences Corp.

■ James F. Farem has been named vice-president of manufacturing at Fortune Systems Corp.

■ Jerald R. Higgins has been promoted to vice-president, worldwide systems sales for Zilog Systems, a division of Zilog, Inc.

■ Arthur D. Lambert has been named vice-president, North American sales for Zenith Data Systems Corp.

■ Dr. John Francis Lubin, professor of management at The Wharton School, University of Pennsylvania, has been elected to the board of directors of Data General Corp.

■ D. T. Wiles, chairman of the investment banking firm of Hambrecht & Quist, has been elected chairman of Magnuson Computer Systems, Inc. Magnuson Computer Systems has been operating under the protection of Chapter 11 of the Federal Bankruptcy Code since March.

■ Martin Marietta Data Systems, Inc.'s Vice-President Shirley F. Pruitch has been named chairwoman of the National Bureau of Standards' Panel for the Institute for Computer Sciences and Technology for a three-year term. She will also serve as an ex officio member of the Board on Assessment of the National Bureau of Standards Programs.

■ Dean O. Morton, executive vice-president of Hewlett-Packard Co., was elected chairman of the board of directors of the American Electronics Association for 1984 at its recent board meeting.

■ Donald L. Steele has been appointed vice-president of University Computing Co. and general manager of its applications software division.

■ Computer Consoles, Inc. has announced the appointment of four vice-presidents. They are David M. Danehak, central engineering; Robert J. LoFaso, corporate marketing services and support services; John M. Murphy, controller; and Jeffrey N. Waxman, office systems sales.

■ Kevin Billingham has been appointed vice-president of business development, and James D'Arezzo has been named vice-president of corporate communications at Compaq Computer Corp.

■ Peter A. Chiaramop has been named vice-president and general manager of the Marketing Division of Computervision Corp.

■ Dennis D. Hilding has been promoted to vice-president, sales, and Ray A. Wilson has been promoted to vice-president of the Computer Services Group at NCA Corp.

■ James S. Campbell, former president of Shugart Corp., a Xerox Corp. subsidiary, has been appointed president, chief executive officer and chairman of Fortune Systems Corp.

■ Larry D. Welkwer has been promoted to vice-president, product development, and Roger M. Lane has been named vice-president, customer service logistics, at Datapoint Corp.

NICKELS & DIMES

Systematics, Inc. has announced second-quarter revenues of $18.6 million and net income of $1.4 million, up 18% and 15%, respectively, over second-quarter last year.

■

Moody's Investors Service has raised the rating on the senior debt of NCR Corp. from A2 to A1. The change affects approximately $248 million of debt. Moody's has also assigned a Prime-1 rating to the commercial paper of NCR Credit Corp., a wholly owned NCR Corp. subsidiary.

■

Software AG Systems, Inc. has reported revenues of $9.9 million and net income of $1.3 million, or 21 cents per share, for second fiscal quarter ended Nov. 30, compared with revenues of $7.2 million and net income of $370,000, or six cents per share, for the same period last year.

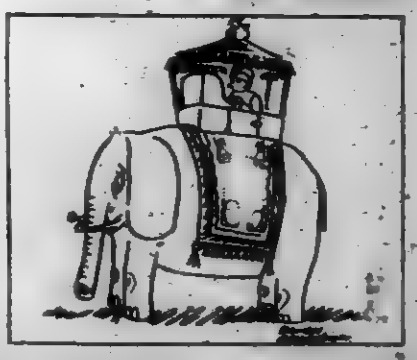
■

Management Assistance, Inc. has announced revenues of $376 million for fiscal year 1983 compared with $358 million for the previous year. Net income was down for the year at $1 million, or 14 cents per share, compared with $7.5 million, or 92 cents per share, for 1982.

■

Moody's Investor Service has lowered its rating on Digital Equip-

Continued on page 82



COMPUTER TECHNOLOGY.

to any grown-up micro or mini you can think of.

Better yet, all Wicat systems give you the same mainframe operating system. So you can move up to a whole new level of performance. Without sacrificing one cent of your original software investment.

What's the operating system? That's your decision. You can have your own MCS, or the industry standard UNIX.* And we give you all the language compilers you could ask for. Nine of them, at last count.

So if you're ready for a direction that makes a lot more sense, call or write us for complete information. Wicat Systems, P.O. Box 539, 1875 South State, Orem, UT 84057. (801) 224-6400.

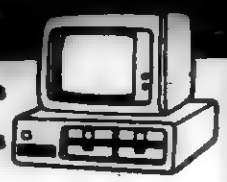
We'll show you how to stay right out there on the leading edge. Without going over it.

WICATsystems™

The grown-down mainframes.

*UNIX is a registered trademark of Bell Laboratories.

ON-SITE MAINTENANCE SERVICE



- Maintenance contract prices up to 50% less than manufacturer's rates
- Fast response time — over 100 field technicians
- Most brands of equipment serviced
- On-site user training programs available

CALL FOR BROCHURE & PRICE LIST

LEWIS BUSINESS MACHINE SERVICE COMPANY
251 Park Avenue South, New York, N.Y. 10010

Continued from page 81

ment Corp.'s $75 million sinking fund debentures from Aa1 to Aa2. The company's commercial paper rating remains unchanged at Prime-1. The action reflects DEC's lower operating profit margins and Moody's belief that those margins and profitability will remain under pressure over the intermediate term.

■

Electronic Data Systems Corp. has reported revenues of $176.4 million and profits of $16.8 million for the first quarter of fiscal 1984, up 23% and 24%, respectively, over the same period last year.

■

IBM has declared a regular quarterly cash dividend of 95 cents per share on common stock payable Dec. 10 to holders of record Nov. 9.

SUPERSHORTS

Wang Laboratories, Inc. has licensed text-to-speech technology from Speech-Plus, Inc. of Mountainview, Calif. The software technology uses 400 letter-to-sound rules and an exceptions dictionary with 3,000 entries to convert serial Ascii English text to immediately intelligible spoken English.

■

Shand, Morahan & Co. has formed an EDP Risks Department as the result of increasing awareness of loss potential in the computer field. The underwriters in the new department will concentrate solely on data processing risks, including unauthorized computer access coverage, electronic data processing professionals' errors and omissions coverage and the development of other computer-related policies.

■

Burroughs Corp. and Telex Computer Products, Inc. have announced their intention to form Plasma Graphics Corp., a jointly owned company that will manufacture and market a line of advanced flat panel information displays for use with computers and electronic instruments. Upon completion of definitive agreements, Plasma Graphics will begin operations in the first quarter of this year at a Plainfield, N.J., facility.

■

R. F. Hutton, which recently announced the Huttonline financial information service, will offer Quasar Corp.'s Quik-Link 300 terminal to Hutton subscribers on a value-added basis with the Huttonline service. Quasar President Jim Lokey said the terminal offered through Hutton's network of 5,000 brokers will be programmed to permit easy access via automatic logon to the Huttonline service. Hutton clients will be able to order a Quasar terminal directly through their account executives and to charge their purchase directly to their R. F. Hutton accounts.

■

Sony Corp. of America has formed the Sony Component Products Division "to serve the expanded ... [OEM] market in the United States," according to Kenji Tamiya, president and chief operating officer.

■

Dartmouth College has signed a contract with Apple Computer, Inc. as part of an overall plan to enable all incoming freshmen to acquire a personal computer at reduced cost by the fall of 1984. According to the agreement, Dartmouth will purchase at least $2 million in Apple equipment over the next three years, including products not yet on the market.

■

Wang Laboratories, Inc. has announced that Cobe Corp. of Madison, Wis., has been selected as an independent sales organization, bringing together Wang's computer technology and Cobe's experience in financial institution informational management. Cobe will market its Cobe-One financial programs on Wang's 2200 series of computers.

How can you afford to have an office full of computer equipment that can't communicate?

XLAN™ lets your mini and micro computers, along with related peripherals, talk to each other. Regardless of type, brand, or nationality.

Because XLAN is compatible with virtually all kinds of computer equipment, its versatility makes networking easy. Your office is connected with an inexpensive shielded-pair cable. It's economical to install and maintain, and it easily permits network additions or reconfigurations.

XLAN was designed for easy use. And cost-efficient operation. Think of it as a computer party line for sharing information and resources. The simple network from Complexx. XLAN.

Complexx Systems, Inc., 4930 Research Drive, Huntsville, AL 35805

POSITION ANNOUNCEMENTS

Applications are invited from qualified applicants for the position of Executive Director of the Washington Library Network (WLN). WLN is an automated bibliographic service to libraries in eight western states and provinces, providing a wide range of library processing and information functions. A study by Peat, Marwick, Mitchell & Company to be completed in early 1984, will help determine future marketing and governance directions.

Opportunity for well-qualified manager to direct a high-technology agency toward continuing success.

The Director should:

- —be responsive to the WLN membership in developing an innovative program of automated bibliographic services for libraries.
- —provide effective day-to-day leadership to WLN operations, working with a diverse team of highly motivated data processing and library professionals.
- —exhibit managerial skills with substantial data processing administrative experience. Experience in a library setting is desirable but not required.
- —work with diverse groups in coordinating a productive pursuit of WLN goals and objectives.

The Director currently reports to the WLN Executive Officer, who is the Washington State Librarian.

This position is exempt from the Washington State Civil Service System, contingent upon Washington State Personnel Board approval.

Send detailed resume to:

BRIGHT FUTURES AT LOCKHEED-AUSTIN.

Engineering and computer specialists interested in advanced military tactical support programs will find Lockheed's division in Austin, Texas, to be extremely interesting.

Lockheed has formed the division to concentrate on some major tactical support programs. They include command and control and target location systems and are active programs for the Army, Navy and Air Force. For those seeking challenge, immediate openings exist for:

★ **ATE DESIGN ENGINEERS**
Several positions exist for engineers at various levels to design avionics test programming sets. A BSEE or equivalent plus 4 years of related experience are required. Some digital design concepts and communication theory with micro-processing-based test equipment background are desirable. Experience with EQUATE/ATLAS is a definite plus.

★ **REAL-TIME SYSTEMS PROGRAMMERS**
Requires a BS and 4 years experience in Assembly language. Prefer applicants with Rolm 1666/Data General NOVA computers and military systems.

★ **SOFTWARE SPECIALISTS - Ada**
Capable of design and development of applications, systems and data communications S/W. Prefer candidates with experience in Ada, graphics display, C³I applications and MIL-STD-SPEC standards.

★ **RF/MICROWAVE ENGINEERS**
Background in R.F. antennas, microwave power supply design, and computer-aided design and analysis will assume responsibility for UHF/VHF data transmission systems on a major program. Automated bus driven R.F. test equipment experience also desirable. Requires BS and 4 years experience in R.F. system design, analysis and testing.

★ **EMC/EMI ENGINEERS**
Background in R.F./microwave systems and digital electronics systems design and analysis. Will assume responsibility for EMC/EMI and TEMPEST activity on major programs. Requires BS and 2 years experience in electronic system/circuit design, analysis and EMC/EMI testing. Experience in TEMPEST requirement satisfaction desirable.

★ **INFRARED (IR)/ELECTRO-OPTICS ENGINEERS**
Positions exist for engineers with a background in IR component/system design, analysis and test. Will assist a major program to develop an IR detection and imaging system. Requires a BS and 4 years related IR/electro-optics system design experience.

★ **SIGNAL PROCESSING SYSTEMS ENGINEERS (C³I)**
To analyze communications and/or radar systems performance; develop conceptual designs and computer simulation tools; and support integration of signal processing algorithms in major C³I systems. Knowledge of wave form signature analysis, statistical pattern recognition, algorithm development, technical threats and mission scenarios is a must. Educational background in advanced modulation detection, estimation theory and aircraft interface design is desirable.

Lockheed offers unmatched opportunity with plenty of room to grow. And in Austin's pleasant setting, affordable living makes excellent salaries go even further.

Lockheed-Austin's exceptional wage and benefits package includes medical, dental and life insurance. A retirement plan is provided, along with much more.

Qualified candidates should send resumes to: Professional Employment, Dept. 653-0184, P.O. Box 17100, Austin, TX 78760. Lockheed is an equal opportunity, Affirmative Action employer. U.S. citizenship is required.

COMPUTER EDUCATION SPECIALIST

Arkansas State University has two positions of computer education specialists. Minimum qualifications include earned doctorate or equivalent work experience in information systems or computer science. Duties include advisement regarding computer education and instruction of courses in information systems and computer science. Salary competitive and commensurate with qualifications and experience. Send curriculum vitae with letters of reference and transcripts of graduate work to Director of Personnel, Box 2169, State University, AR 72467. ASU is an AA/EOE.

DIRECTOR OF MANAGEMENT INFORMATION SERVICES

Dundalk Community College, a public comprehensive college serving Southeastern Baltimore County Maryland, has an opening for a Director of Management Information Services to assume overall responsibility for managing computer resources in a distributive environment.

The college is currently functioning within a shared-computer environment and utilizes a host mainframe (IBM 4341). The college is committed to a path of development which will provide for enhanced and expanded local capabilities while at the same time maintaining potential interface with the host mainframe. Accordingly, the candidate selected will, in addition to normal administrative functions, coordinate and design the development of new systems to meet both administrative and academic computing needs.

Successful candidates will have five or more years of relevant technical experience in computer operations, programming and systems design, preferably in an educational environment including at least two years of experience in a project management capacity. They will possess demonstrated knowledge of a variety of hardware and software, distributive management systems and information systems design, and will also demonstrate the proper blend of ingenuity, commitment and interpersonal skills.

For application and a copy of the job description call (301) 522-4288 or write Personnel Office, Dundalk Community College, 7200 Sollers Point Road, Baltimore, MD 21222.

Applications must be postmarked no later than February 10, 1984. EOE/AA.

SOFTWARE SUPPORT SPECIALISTS

NEW CONCEPTS IN CUSTOMER SUPPORT OPEN EXCITING CAREER PATHS IN THE ROCKIES.

Our accelerated growth in providing state-of-the-art software support has created exceptional opportunities for highly motivated, technically proficient specialists. You'll be in the forefront of computer technology as part of Digital's most advanced Customer Support Center, staffed by teams of specialists. Equipped with virtually unlimited computer resources, the Center provides software support to our customers throughout the U.S. and Canada. Join us for this unique opportunity.

We want to talk to you if you have: the communications skills to consult with our customers on a one-to-one basis, the ability to work as a team member while researching and structuring innovative solutions to complex software problems, and the drive to take full advantage of the technical and managerial growth opportunities our expansion will create.

If you're interested in and qualified for one of the following positions, write to us this week.

TOPS-20/TOPS-10—requires at least 1-5 years of operating system support experience with DECSYSTEM-10's, DECSYSTEM-20's or other large time-sharing systems. Applications experience in several high-level languages preferred.

VMS—requires at least 2 or more years of application and/or system software experience. Experience with VAX/VMS software a plus.

DECnet—requires at least 1-2 years' experience working with DECnet applications of VAX, RSX, and RSTS systems and a solid knowledge of communication protocols.

RSX—requires at least 2 years' applications or 1 year's systems experience with RSX-11M or RSX-11M-PLUS.

CTS-300/RT-11—requires at least 1 year's experience with applications and/or system experience.

PRESALES/TECH SUPPORT DIGITAL SYSTEMS—experience on at least one or more Digital operating systems or configurations.

SENIOR FIELD SERVICE ENGINEERS—requires at least 3 or more years in a hardware engineering environment. 16-32-, 36-bit experience desirable.

All these positions offer competitive salary/benefits package plus relocation assistance to Colorado Springs, an area with a moderate year-round climate, a reasonable cost of living, and a wide variety of recreational and cultural attractions.

To apply, please send your resume to: Susan Chamberlain, Digital Equipment Corporation, Customer Support Center, Dept. 0109 3804, 4405 North Chestnut Street, Colorado Springs, Colorado 80907.

We are an affirmative action employer.

PYA/Monarch

PYA/Monarch, a division of Fortune 100 Consolidated Foods Corporation, is the third largest food service distributor in the U.S. We supply food and non-food products and services to restaurants, cafeterias, caterers, hospitals, schools and colleges, hotels and motels, etc., from coast to coast. Our corporation has grown from sales of $470 million to sales that now exceed $1 billion since 1978.

Greenville, South Carolina

Greenville, S.C. rests peacefully at the foothills of the Blue Ridge Mountains. Snow skiing, beautiful Carolina beaches and abundant lakes offer vibrant recreational opportunities. Combine the natural beauty with our low cost of living and Greenville, S.C. is a most inviting locale.

PYA/Monarch Opportunities

Because of PYA/Monarch's commitment to maintain our dominant position in the food service industry, our present MIS plan will put in place an information processing environment unequaled in the food service industry. We afford capable professionals the opportunity to fulfill their professional, personal goals within a dynamic, innovative, ever-changing IBM 3083, MVS, on-line environment.

Project Manager - Distribution Systems

Strong systems analysis and design skills required to direct systems development projects in purchasing, inventory management and sales analysis. Applicant should be familiar with Data Base Management concepts and have experience managing major development projects.

Programmer/Analyst - Distribution Systems

Applicant should have experience in the development of large mainframe based distribution systems. Specific areas of planned development are order processing, purchasing and inventory management.

Programmer/Analyst - Sales Analysis

Applicant should have experience with Data Base Management systems and the development of sales reporting systems. Position requires good written and oral communication skills.

Quality Assurance Analyst

Monitor applications systems development process to ensure compliance with departmental standards, develop and implement sytems test plans and assist in the development of user documentation and training material. Knowledge of systems development process is required.

Installation Representative

Installation of application software and training of user personnel. Degree or course work in Computer Science is preferred. Travel required.

Please send resume and an outline of salary history to:

High Technology Consulting

Look to the FUTURE!

SEI's role and reputation continue to grow as one of the nation's leading project-oriented, high technology consulting organizations. SEI consultant teams' skills are in demand to specify and construct sophisticated systems and applications across the country.

SEI looks to the future with a variety of new, challenging, large-scale system development efforts. New SEI projects include industrial automation, advanced microprocessor systems, and support for the emerging cellular telephone industry. These projects, now getting under way, offer you an unparalleled opportunity to be involved in major applications and internals efforts from the ground up.

SEI is seeking first-rate professionals -- leaders and technical experts -- who also look to the future: Eager to learn, ready to work hard, serious about their careers, interested in the variety and challenge of consulting.

Look to YOUR Future!

DEVELOPMENT MANAGERS
$46,000-$75,000

Direct the planning, staffing, construction of major mainframe and microprocessor-based development efforts. We're looking for hands-on, technically-oriented managers, who lead from personal, practical experience in the construction of sophisticated systems.

Qualifications:

- Outstanding technical and leadership skills
- Familiarity with System Development and Project Control methods
- Strong background in microprocessor technology or IBM mainframes
- Minimum 8 years relevant experience

Positions in Chicago, New York, Phoenix, and San Francisco

APPLICATION DEVELOPERS
$31,000-$61,000

Get in on the ground floor of development for a major new support system for the communications industry -- Worldwide, Networked, Online -- One of the genuinely significant development projects of the 1980s. Help define the state of the art!

Qualifications:

- Working knowledge of Structured Analysis and Design
- Familiarity with large scale IBM environments and software: VM/CMS, OS/MVS, CICS, IMS, VSAM
- Minimum 6 years solid, real-world development experience
- Experience with FOCUS a plus

Positions in Chicago, New York, and Phoenix

TECHNICAL WRITERS
$31,000-$56,000

At SEI, Technical Writers are contributing consultants, not just editors of other people's drafts. SEI Technical Writers participate in all aspects of major development projects, studies, proposals, document preparation, quality assurance.

Qualifications:

- Outstanding writing and editing credentials
- Minimum 4 years experience in programming, system analysis, and design
- Exceptional good sense and broad perspective on EDP
- College level teaching experience a plus

Positions in Chicago, New York, and Phoenix

BUSINESS ANALYSTS
$38,000-$61,000

Your job? Determine what systems are actually supposed to DO! Perform requirements analyses, cost-benefit studies, preliminary system designs. Interact directly with top client personnel. Provide ongoing user advocacy and direction to development projects.

Qualifications:

- Broad technical skills, including a minimum 4 years experience in programming, system design, and analysis
- Working knowledge of Structured Analysis and Design
- Ability to communicate effectively with a wide range of business and technical people
- Writing/teaching experience a plus

Positions in Chicago, Los Angeles, New York, Phoenix, and San Francisco

MICROPROCESSOR SOFTWARE EXPERTS
$38,000-$75,000

SEI micro projects are major systems. Participate in the development of leading edge microprocessor-based products. Help establish development environments, port and tailor software, contribute to the development of firmware and hardware.

Qualifications:

- Working knowledge of micro-based operating systems, compilers, communications, I/O drivers, Local Area Networks, and software products
- Demonstrated skills in large-scale software development
- Minimum 6 years experience
- Experience with UNIX and 68000 a plus

Positions in Chicago, Los Angeles, Phoenix, and San Francisco

IBM SYSTEM INTERNALS EXPERTS
$46,000-$75,000

Construct and enhance development and production environments. Participate in custom tailoring, installation, troubleshooting, performance evaluation and tuning, capacity/configuration analysis and planning for systems and communications.

Qualifications:

- In-depth knowledge of IBM mainstream products including: CICS, IMS DB/DC, VM/CMS, OS/MVS, SNA/ACF/NCP/VTAM
- Outstanding assembly language programming skills
- Understanding of the interaction between systems and applications
- Minimum 6 years experience

Positions in Chicago, New York, and Phoenix

SEI offers top salaries, an imaginative personalized benefits package, unlimited opportunity for growth, and the challenge of working alongside other SEI consultants -- the best in the business.

THE BUSINESS OF TECHNOLOGY

-- An Equal Opportunity Employer M/F --

JOIN A TEAM ON THE LEADING EDGE OF TECHNOLOGY!

Computer Consoles, Inc., designs, manufactures, markets, and services a variety of minicomputer-based fault-tolerant information systems. Located in Rochester, New York, we have all the cultural and educational advantages of a large metropolitan area as well as the ambience and scenic beauty of a small, relaxed town.

CCI currently has opportunities for:

GROUP LEADER/DEVELOPMENT SYSTEMS

You will be responsible for software, systems administration, and operations for 32-bit super minis using UNIX* as software development systems.

We prefer a technical degree with a minimum of 5 years' system and/or managerial experience. Knowledge of "C" and UNIX internals a must.

DATA MANAGEMENT SYSTEMS DESIGNER

You will be a member of a team responsible for designing and developing an interactive transaction data management system. This includes an integrated data dictionary, query editor and advanced files access method. A non-procedural commercial application generator and forms manager provide easy-to-use facilities for end-users. The total system is integrated into PERPOS™. CCI's multi-processor Power 5™ family of systems and office automation products.

We prefer a B.S./M.S. in C.S./E.E. plus 4-5 years' experience in system design and development of data management systems. Experience with UNIX and "C" is highly desirable.

SENIOR SOFTWARE ENGINEER

You will be responsible for the design and development of PERPOS™, a UNIX-compatible fault-tolerant operating system.

We prefer a B.S.C.S. plus 3-5 years' related experience. You must have UNIX, "C", and OS internals experience.

SENIOR SYSTEM SPECIALIST

You will be the lead designer and developer of advanced R&D projects that will extend CCI's Power Series of fault-tolerant systems.

An advanced degree with extensive experience in UNIX operating system development are required. Additional experience with other operating systems and hardware system design is highly desirable.

**UNIX is a trademark of Bell Labs.*

We offer challenging assignments, opportunities for growth, attractive compensation, and a benefits package that includes dental and profit sharing plans. Please send your confidential resume, including salary history and indicating position of interest, to:

Question:

Why should you work at Tandem?

Answer:

Because not just anybody can.

A lot has been written about Tandem's success. We pioneered fault-tolerant computing. Tandem systems offer unparalleled flexibility and networking capability. And our work environment has been cited as an example of corporate excellence.

But we couldn't have come as far as we have without exceptional people. In fact, our revenues have grown 33% in 1983. So, while we are growing rapidly—and have many opportunities for Sales Representatives, Systems Analysts, and Customer Engineers—we're still very selective about who we hire.

What's so special about Tandem People?

Commitment. From the shipping dock to R&D, everyone at Tandem is committed to the ongoing success of the company. And with good reason—everyone shares in the success of the company. One indicator is the fact that over one-third of Tandem stock is held by our employees.

Tandem people are also extremely professional. Our unique, decentralized structure demands people who accept responsibility willingly, because everyone is given a rare degree of autonomy.

If you're looking for a place where your colleagues are highly motivated, dedicated professionals, then you're somebody we'd like to talk to. Apply now for one of these excellent career opportunities with Tandem:

Systems Analysts

We're looking for talented Systems Analysts to provide pre- and post-sales support, including sizing and configuration planning, design analysis, applications design, benchmarks, and technical presentations. You will also evaluate user education requirements, and generally plan smooth installations with our Sales Representatives. *Additionally, we're looking for experienced educators and design support personnel.* These positions require a minimum of 6 years' applicable experience, with a thorough knowledge of one or more of the following: OS internals, data communications protocols, database design, or project management in an on-line environment.

Sales Representatives

We're looking for Sales Representatives to work with customer upper- and executive-level management in FORTUNE 500-sized organizations to sell Tandem systems and aid in their installation. Your commissions will be limited only by your ambition. These outstanding opportunities call for aggressive, professional salespeople with over 5 years' proven ability to sell large business systems.

Customer Engineers

To keep our systems performing flawlessly, Tandem is looking for Customer Engineers to work with clients. Responsibilities include the installation, maintenance, troubleshooting and repair of Tandem systems, including peripherals and controllers. To qualify, you should have at least 5 years' extensive hardware support experience with large-scale computer systems.

How to apply

Western Division

To apply for positions in Northern California, call Janet Heckman at (415) 777-1230, or send your résumé to her attention: Tandem Computers, Inc., 4 Embarcadero Center, Suite 3000, San Francisco, CA 94111.

For positions in all other states west of the Rockies, call Lisa Deutschman at (408) 970-4386 or send your résumé to her attention: Tandem Computers, Inc., 2820 San Tomas Expressway, Santa Clara, CA 95051.

Central Division

Encompassing the entire Midwest as far south as Texas and as far east as Pittsburgh.

Send your résumé to Steve Sleffuick, Tandem Computers, Inc., Two Woodfield Lake, 1100 Woodfield Road, Suite 450, Schaumburg, IL 60195; or call (312) 884-6684.

Eastern Division

Including the entire Eastern Seaboard and southern states as far west as Mississippi.

Contact Mark Lynch, Tandem Computers, Inc., 12100 Sunrise Valley Drive, Reston, VA 22901.

In fiscal 1984, our expanding customer base is driving revenue growth at 62% and creating exceptional opportunities for talented professionals who share our commitment to excellence.

Manufacturing Applications Support

Post-Sales

Successful candidates will assume responsibility for manufacturing software support at customer locations, and provide education in manufacturing applications internally and externally. Qualified candidates must possess a minimum of 5 years' DP experience in manufacturing applications demonstrating a solid understanding of the user environment. Programming or system design experience and well developed interpersonal/communication skills are essential. Additionally, the ideal candidate's background will include combined experience in customer support, vendor application software, and software installation. Project leadership talent required. Openings are available in:
• Los Angeles • Cleveland • Denver • Edison, NJ • Chicago • Detroit

DB/DC Consultants

Field Support

You'll be responsible for software installation and customer education, as well as database and applications systems design reviews, including interface with user management and technical representatives. To qualify, you must possess a minimum of 3-5 years' systems programming experience using Assembler on OS, DOS, MVS, VSI operating systems or several years as a database administrator involved in the design, implementation and testing/tuning of a database such as IMS, IDMS, or TOTAL. Teleprocessing background (CICS, IMS-DC, Shadow) would be helpful. Openings are available on the following cities:
• Washington, DC • Atlanta • Charlotte • Tampa • Chicago • Minneapolis • Cleveland • St. Louis • Detroit

Customer Support Manager

New York City

The successful candidate must possess 7-10 years' DP experience in a large IBM mainframe environment and 3-5 years' background in management to assume a key role managing a team of post-sales technical support specialists responsible for the implementation and installation of systems and applications software. You'll ensure customer satisfaction for an assigned group of major accounts, utilizing a strong marketing/business orientation, solid interpersonal/communication skills and familiarity with recruiting, hiring, training and expense control.

Marketing Support Representatives

Pre-Sales

These key positions throughout the U.S. require extensive systems level experience with IBM-based DB/DC software in an on-line environment. A solid grounding in operating systems is essential. Superior communication and people skills are a must. Vendor experience in supporting technical sales is a definite plus.

Candidates interested in challenging careers involving extensive travel may explore these and other opportunities throughout the U.S. by writing to C.H. Levy, Dept. CW-1984, Cullinet, 400 Blue Hill Drive, Westwood, MA 02090. Candidates for positions in this advertisement should include resume and **must** specify position of interest and geographic preference.

Fotz, Chair, CIS/CS Dept., College of St. Thomas, St. Paul, MN 55105.

Programmer/Analysts

We're Looking For The Kind Of People Who Can Juggle Assignments.

Fairfield County, Connecticut

We're TSI International, one of the world's largest proprietary software product vendors. With over 2000 clients worldwide and more than a decade of experience, our industry reputation for quality software products and services has been firmly established. Our people have made the difference.

We've gained our position in this industry by hiring and developing the best professional talent in the business. DP professionals who do not simply want to be locked behind a tube. People who excel in an environment that provides continual variety and challenge. In short, professionals who not only possess the sense of invention necessary for ongoing software product development, but who also enjoy being the technical backup for our field marketing staff and clients as well.

While our revenues and size have grown considerably, our management still recognizes and rewards individual contributors. Today, we remain a small, personal company that has matured - not simply grown large. And our people share the benefits, resources and security of being part of the Dun & Bradstreet family of companies.

We expect 1984 to be a year of continued growth for TSI and our employees. If challenge and variety appeal to you, look into several positions currently available in our Wilton, Connecticut headquarters.

Software Product Specialists

As a Product Specialist at TSI, your role will encompass both software development and support. You will participate in all phases of the software business including the design, coding, testing, debugging and maintenance of proprietary software packages. Additionally, relying upon your strong written and verbal communication skills, you'll provide high level customer and sales support.

As a member of a small, cooperative team, you will represent an advanced software product sold to the IBM (Honeywell or Univac) mainframe environment. Products that include database design tools (Facets); data dictionaries (Data Catalogue 2); storage and retrieval systems for CICS (Docu/Master); and other technologically advanced software tools in the beginning stages of development.

To qualify, you should have 3-5 years of COBOL programming experience in an on-line, IBM environment. Exposure to DBMS (IMS, TOTAL, ADABAS, ETC.) along with some working knowledge of BAL and CICS (command or macro) will be necessary. For one of our positions, experience with large Univac systems is desirable.

In return, we'll offer you a whole new world of varied assignments and opportunities. You will be in the position to make a difference, to become a key contributor to the growth of the team and the company. Additionally, we'll provide you with generous medical, dental, tuition and profit sharing benefits. For immediate consideration, send your resume to C.P. Bean, Mailstop #11, TSI International, 187 Danbury Road, Wilton CT 06897

TSI International

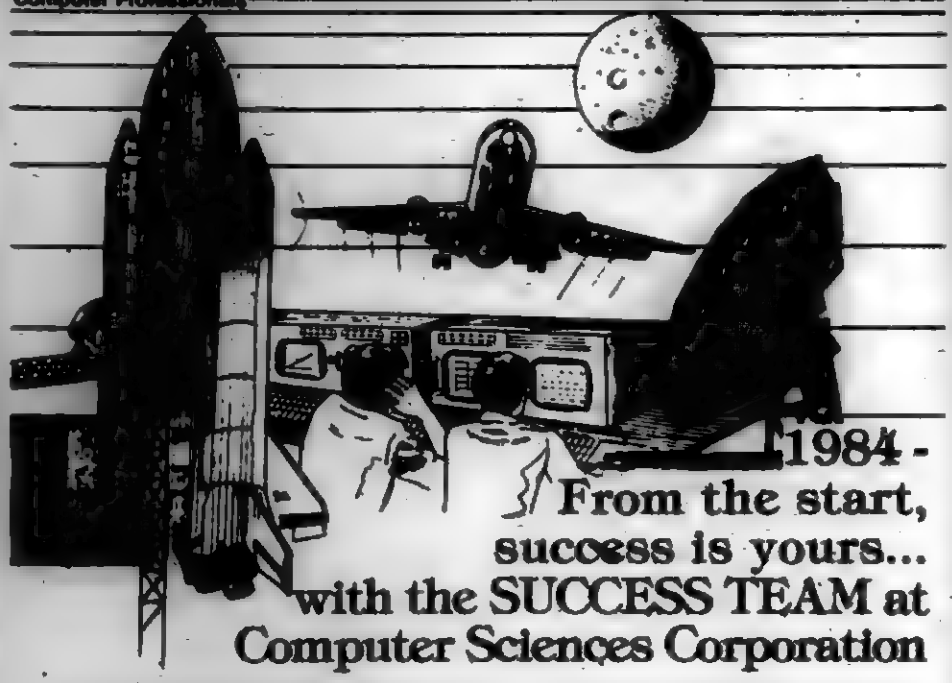
Computer Professionals



1984 - From the start, success is yours... with the SUCCESS TEAM at Computer Sciences Corporation

Make 1984 your "success year" with CSC, a company that has earned industry distinction for the caliber and commitment of its personnel. At the System Sciences Division, we have become THE SUCCESS TEAM by providing the most technically advanced software systems and by recognizing the abilities and achievements of our employees. Start the New Year by resolving to take advantage of such an environment.

We continue to provide the NASA Goddard Space Flight Center with systems that support such sophisticated programs as Tracking and Data Relay Satellite System Operation, the Network Control Center and the Flight Dynamics and Control Systems Program.

Immediate openings are available for computer professionals with Bachelor's or advanced degrees in Mathematics, Physics, Astronomy, Electrical Engineering or Computer Sciences. If your background includes solid experience in FORTRAN or Assembly Language and you have worked with state-of-the-art Computer Systems utilizing sophisticated Programming Applications and Software Engineering techniques, you are encouraged to make 1984 your most professionally and personally rewarding year yet.

These exceptional opportunities are complemented by excellent salaries and a comprehensive benefits package. For prompt consideration, send your resume to: Staffing Department CW-518 or call TOLL FREE: 800-638-0842 or call locally (301) 589-1545.

SOFTWARE ENGINEERS

If you want a positive atmosphere:

Unencumbered by staff management and other distractions, to use and further develop your state-of-the-art conceptual and programming skills, please read on —

Our Corporate objective is the integration of a nationwide private X.25 network with traditional communications protocols, to support short response time inquiry applications and store and forward batch transmission applications.

To achieve our objective, we are looking for several high-technology professionals who; perceive the challenges we face, have implemented solutions in these areas and would value the opportunity to engage in technically challenging work.

If you have in-depth quality programming experience in and an understanding of:

- development and integration of user invented systems software with vendor software
- real time distributed processing
- remote interface processors
- telecommunications network implementation

and you:

- have technical excellence as a career objective
- thoroughly enjoy the freedom to work toward simple solutions to complex problems
- take prideful responsibility for your creations
- have a history of successful project implementation

Let's Talk!

MasterCard, a recognized leader in world-wide funds transfer, is developing network technology to accommodate growing needs in the electronic financial services environment. We offer an attractive benefits package including competitive salary, 3 weeks vacation, health, life and dental insurance, an industry leading savings plan and a favorable cost-of-living location.

Send us, in strict confidence, your latest resume, handwritten update or comments and present cash compensation. If you don't have a resume, feel free to call and leave your phone number(s) -- we will respond.

National Computer Associates

PROJECT LEADER

Beaird-Poulan/Weed Eater Division of Emerson Electronic Company is expanding its MIS Department and offers growth opportunities for a Manufacturing Systems Project Leader.

Our present computer environment includes an IBM 4341 and an IBM 3031 running OS/MVS and DOS/VSE. We use CICS and IMS for data communications and data base.

Our manufacturing systems are being developed in conjunction with the IBM COPICS system.

The ideal candidate for the Manufacturing Project Leader should have 4-6 years in-depth manufacturing systems experience, be degreed and experienced at the detail level with COPICS. OS/MVS experience is a definite plus.

This position offers a competitive salary and benefits package and is located in our Division headquarters in Shreveport, Louisiana. Shreveport is located in Northwest Louisiana, and has a community of 375,000.

Send resumé and salary history to:

BEAIRD-POULAN/WEED EATER
DIVISION EMERSON ELECTRIC CO.
Manager of Employment
P.O. Box 9329 • Shreveport, La. 71139

An equal opportunity employer.

EMERSON

HAVE A HAPPY NEW YEAR AT NORTHROP.

1983 was a year filled with accomplishments at Northrop Data Processing. We completed a major reorganization along divisional lines to enhance our responsiveness to a wide variety of needs. New Data Centers utilizing IBM's latest mainframes and operating systems were established. We introduced our first Information Service Center at the Aircraft Division and provided continued support to Engineering, Manufacturing and Financial functions.

1983 was a big year. As a service organization we can't rest on the success of last year. We must continue evaluating future needs and plan accordingly.

1984 promises to be a year of continued growth for both the divisions we service and ourselves. We will continue applications programming support to a full range of functional organizations and take on new challenges. In 1984, we will create additional Information Service Centers and establish the Applications Development Center as an aid to programmers. Continuing improvements to our network systems will include integration of personal computers into the framework of software services.

1984 looks like another big year for Northrop's data processing professionals. How does it look for you? If you don't see diversified challenge, success and reward coming with the new year, perhaps you should consider our broad range of opportunities.

- **Software Project/Product Management**
- **Computer Systems Planning**
- **Operating Systems Software Support Including Performance Tuning**
- **IMS Systems Software & Data Base Administration**
- **Graphics & Aeroscience Support Programming**
- **Manufacturing & Financial Applications Programming**

If you're experienced in any of these areas, we'll welcome your inquiry. For immediate and confidential consideration, send us your resume and, Happy New Year!

Mr. Cris Cristine
Engineering & Administrative Staffing
Dept. 1222/80 NA-CW 128305

UNIX* Software/"C" Professionals

The most important meeting at UniForum could be between you and Bunker Ramo

We're a leading source of state-of-the-art information systems for the financial services industry, with a 50-year history of producing landmark on-line transaction processing systems. Today, our engineering team is making landmark achievements in the commercial application of UNIX systems with our new generation of products, which combine a 32 bit system architecture with the UNIX operating system. This real-time multi-user system along with its sophisticated communications provides the financial services industry with a full range of information services and user friendly applications.

Our large scale product development effort means opportunities for Systems & Software Engineering Professionals. If your background fits any of the openings below, see us at the UniForum Winter Conference. There our technical managers and engineers will be showing off our systems and talking about careers. Your visit could begin a bright new future.

Software Product Development
Design and implement "C" language software products for our Motorola M68000/UNIX systems and intelligent clustered workstations. Applications range from distributed transaction processing to office automation.

System Software Development
Specification, design and implementation of UNIX software kernel enhancements and modifications. Operating system performance analysis and evaluation.

Communication Software Development
Design and develop software related to device emulation projects (SNA, SDLC, X.25, Bisync) and local area networking.

Product Assurance
QA engineering for real-time multi-user UNIX software applications written in "C", including network test, SNA,X.25, SDLC, Bisync. Also "C" and UNIX software programmers for productivity and test tool development.

Software Instruction
To develop state-of-the-art courses in microcomputer languages and operating systems. In-house or at customer site, these courses are in high professional demand in this explosive field.

Our engineering staff has access to highly productive development tools (VAX 11/780 UNIX HP64000 Development Systems) and sophisticated laboratory facilities at our modern Trumbull, Connecticut Headquarters—a prime educational and cultural area approximately 60 miles from New York City.

Join us at UniForum
Jan. 17,18,19.(Tues.,Wed.,Thurs.)

See us at Booth 12 (on the Terrace level) or stop by our Hospitality Suite between 4PM & 9PM at the Washington Hilton.

If unable to see us at UniForum and are interested in the opportunities we have available, please forward a resume to Steve Mooney—or call him collect.

EDP Professionals

Middle South Services has one of the South's largest data processing centers serving one of the nation's largest power systems. Middle South Utilities, our parent company, is a major electric utility. Our hardware environment includes two IBM 3081s, and IBM 4341 and Tandem mini 16s. If you are a career-minded EDP professional, we have the following opportunities available:

PROJECT LEADER With strong hands-on management background to work on an on-line distribution, construction and operating system. Requires at least 1-plus years experience as a first-line supervisor or lead analyst on a medium to large-scale system utilizing IMS DB/DC and involving maintenance, enhancement and program performance.

(IMS) SYSTEMS PROGRAMMER Will install new releases, apply maintenance, perform problem resolution and assist with tuning. Requires at least 1-2 years systems programming experience in IMS DB/DC and related products.

(MVS) SYSTEMS PROGRAMMER With at least 2-plus years experience in MVS operating systems to install, monitor, help problem-solve, tune and assist in the installation of MVS/XA systems migration.

ANALYST PROGRAMMERS Requires previous experience in scientific applications with a sound knowledge of PL-1 and OS JCL. Though not required, knowledge of IMS/ADF or FORTRAN would be a plus. Computer applications development with exposure to a VM operating system would be helpful.

SENIOR ANALYST PROGRAMMERS The ideal candidates will use their extensive experience in designing and programming business systems on a large mainframe to develop and enhance financial systems. Application experience preferred in cost accounting, inventory control, general ledger and/or accounts receivable. Familiarity with COBOL, PL-1 and TSO helpful but not required. An accounting degree, computer science/business degree or equivalent work experience is required.

Due to our size and scope of operation, we offer access for advancement, career stability and an excellent salary with major benefits. For more information, call our number below or to apply directly, send your confidential resume to Byron Heath or Richard Jackson, MIDDLE SOUTH SERVICES, INC., P.O. BOX 61000, NEW ORLEANS, LA 70161.

DRAW SUCCESS FROM SUCCESS . . .

intel

WHERE INTEL HARDWARE AND SOFTWARE MEET.

Intel Corporation's leadership in superior circuitry is common knowledge, and our expanding efforts in software are drawing uncommon recognition as well. That's why your successes in building a Systems Integration and Test career should lead you to Intel in Portland, where an uncommon meeting of career potential and lifestyle satisfaction can be yours.

SYSTEM INTEGRATION AND TEST ENGINEERS

As a key contributor to our Product Integration and Evaluation Group, you'll need expertise ranging from the elaboration of basic system test concepts to the overall test planning and test system design. Our highly significant innovative systems incorporates many new elements. The advanced nature of our project requires your ability to lead a team in integration planning and detailed test systems design and implementation. You and a 4-8 member team will cover everything from general concepts to complex details in applying your system software design and testing experience. 3-5 years' minimum experience is required, emphasizing integration on mainframes and/or large mini-computer systems, and backed by a Master's in CT, EE, CS or equivalent.

When you total up the dynamic leadership Intel has proven, the basic challenges presented by our current project, our excellent salary/benefit offerings, and the attractions of our beautiful location, you'll probably draw the conclusion that this is an uncommon opportunity. For immediate consideration, please send your resume to: Harry Speltz, Intel Corporation, JFL-1-148, 5200 NE Elam Young Parkway, Dept. 08729, Hillsboro, OR 97123 or call (503) 681-4608. An Equal Opportunity Employer M/F/H.

DEVELOP YOUR FUTURE AT . . . CANDLE CORPORATION

CANDLE CORPORATION, a multinational computer software company (developer of OMEGAMON®), is looking for extremely qualified people to join our Technical Services staff. Our highly innovative products have attracted an impressive range of Fortune 1000 clients. Continued growth and diversification have created the following openings:

Software Development

To assist in the development of user friendly product externals and participate in overall product design. This position will involve coordination and review among internal technical personnel and the user community to insure design specifications and externals requirements are met.

Requirements include four or more years of software development experience with large scale systems and knowledge of Systems Performance Evaluation Software. Excellent verbal and written skills are necessary.

Technical Support Specialists

You will be the technical interface between Candle and our customers. It is through this group that the image of Candle is reflected to the world.

SR. DOS SPECIALIST

Requires extensive knowledge of CICS/VS internals in a DOS/VS(E) environment. Must have excellent communication and presentation skills. Knowledge of performance and tuning concepts is also desired. Position involves extensive customer interface. Openings in our Los Angeles, New York, and San Jose facilities.

SR. SYSTEMS SPECIALIST

Requires knowledge of MVS and either IMS or CICS internals. Must have excellent communication skills. Knowledge of performance and tuning concepts is also desired. Position involves extensive customer interface. Openings in our New York, Los Angeles, and San Jose facilities.

Quality Assurance Manager

Will manage effort to build test cases and stress test all Candle software products prior to shipment. Also responsible for ensuring user friendliness of Candle products, good documentation and ease of installation. Systems programming background as well as quality assurance experience in large scale environments desired.

Data Security Specialist

Must have a minimum of 3 years' MVS operating system experience and previous experience with design/implementation of data security systems. Position open at our Los Angeles facility.

Product Planning Specialist

You will assist with design review, design coordination and product planning. Other responsibilities include current/future product research and consulting to the Marketing Department.

Requires broad experience in evaluation and planning activities in large scale environments. An in-depth knowledge of MVS, VM, IMS, CICS or IBM TP is also required. Position open at our Los Angeles facility.

MVS Programmer

Duties will include internals/external design. Heavy assembler language coding, 3-6 years, and a good working knowledge of MVS/370 control and flow, as well as performance considerations. Knowledge of supervisor helpful.

These openings provide an opportunity to work with some of the top people in the industry.

POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

MANAGER/ SYSTEMS PROGRAMMING

Who has a DP environment large enough to be state-of-the-art and small enough for high visibility? The folks who do it right!

And, the folks who do it right, Kentucky Fried Chicken, want you to find out about the varied projects, room for creativity and the chance to learn and grow within a growing Department. Currently, our Information Resource Management (IRM) Department is expanding and has created the following career spot.

Responsibilities include participation in the development/implementation of computer hardware and software planning and resource management. You will coordinate the implementation/maintenance of all operating systems and software products. VM/MVS and/or OS/VSI and CICS background required.

At least 8-10 years' experience with computer mainframes, associated peripherals and data communications equipment is required. You should be thoroughly familiar with IBM operating systems and software. DOS/VSE to MVS conversion experience is essential. Management and interpersonal skills, as well as a degree (or close to completion) in Business, Computer Science or related field are required.

We offer an excellent salary, comprehensive benefits program and a professional environment. For further information, please send your resume, stating background, salary history and requirements, to: Ms. Kathleen Brittain, Employment Specialist, Kentucky Fried Chicken, P.O. Box 32070, Department 294C, Louisville, KY 40232. We are an equal opportunity employer M/F.

Kentucky Fried Chicken.

Alascom, Inc., Alaska's long lines common carrier, has an immediate opening in the Marketing Department for an

ACCOUNT REPRESENTATIVE

Successful candidate must have a thorough knowledge of protocols, multiplexing, speed conversions and packet switched data networks, and be well versed in current telecommunications systems concepts with professional sales or communications marketing background in computers and data communications. A Bachelor's Degree in Marketing or related field plus three years successful sales or related experience in a common carrier operating telephone service company or technologically sophisticated environment required.

Alascom offers competitive salaries and benefits, in addition to excellent working conditions. Qualified individuals should send a resume to Alascom, Inc. Employment Office, H-130, Pouch 6607, Anchorage, AK 99502. An equal opportunity employer.

ALASCOM

DALLAS

Full interview, info and fee paid for large scale Real Systems PAPL and local growing stable company in suburban Dallas. If you are considering a move to Dallas, this is the possible situation. Salary open. D.S.E. Contact us to find out more.

Dallas, TX 75247 (214) 637-4848

DATA PROCESSING CAREERS

FACULTY POSITION COMPUTER SCIENCE DEPARTMENT

Two or more full-time faculty positions starting September, 1984, or January, 1985. Teaching responsibilities and opportunity exists in Operations Research and Quantity Analysis, Data Structures, and/or Data Base Management Systems. Terminal degree in Computer Science or related area required. Masters in a related area, with experience, are encouraged to apply. Rank and salary dependent on qualifications. Summer teaching and enrollment stipend. Send inquiries, with graduate transcripts received by April 1, 1984, to

Dr. Duane Bender,
Computer Science Department,
Minnesota State University,
P. O. Box 16, Mankato, MN 56001.

Application Software Manager

Are You Interested in a Rewarding Challenge That's Unique to Tektronix?

Our engineering professionals enjoy the fact that they are working with technology found nowhere else in the world. We're where you ought to be, with the world's leading manufacturer of oscilloscopes and many other general purpose instruments.

Your specific challenge will be to lead a software group in the support of customer applications in current and future Laboratory Instrument Systems products. Responsibilities will include the implementation of utility, training and application software products, and development of an expert level of technical knowledge in Laboratory Instrument measurement applications.

An EE or CS degree along with recent experience in writing code in high-level computer language such as BASIC, FORTRAN, and PASCAL are required. In addition, we require project management experience, and a willingness to travel 10-25% of the time.

Our rewards are what you might expect from a billion dollar, Fortune 500 company. For immediate consideration, please send your resume to Vivian Stock, MS 39-313, Tektronix, Inc., P.O. Box 500, AKL1, Beaverton, OR 97077.

We are an equal opportunity employer m/f/h.

Systems Analyst, Electronic Data Processing: Analyses business and scientific procedures and problems to refine data and convert it to programmable form for electronic data processing, utilizing the UNIX operating system. Forty hours per week, 8:00 a.m. to 5:30 p.m. $24,000 per year. Bachelor of science or master of science in computer science required. Three months experience required. Submit resume to: Job Service of Florida, 105 East Broward Boulevard, Fort Lauderdale, Florida 33302. Refer to Job Order #3736870.

Maine Yankee Atomic Power Company is currently seeking experienced Systems Analysts for the following positions:

Senior Systems Analyst

This position will be responsible for design, review and test plan analysis of software systems and data base applications. Qualifications should include: MS degree in Computer Science, 5 or more years of computer experience.

Systems Analyst

This position will be responsible for the design and implementation of process control software including the development of new process applications in color graphics in a real time sensor based environment. Qualifications should include: BS degree in Computer Science, Math or Engineering, 3 or more years experience as a Software Engineer.

Systems Analyst

This position will be responsible for the development, updating and maintenance of a nuclear power plant operations simulator. Qualifications should include: BS degree in Computer Science, Math or Engineering, 2 or more years of systems experience, preferably in computer modeling.

Maine Yankee offers career growth in a challenging work environment with competitive salaries and benefits. Send resume outlining work history and salary requirements to: Lawrence J. Davis, Personnel Coordinator, Maine Yankee Atomic Power Company, Edison Drive, Augusta, Maine 04336, (207) 622-3521

Equal Opportunity Employer M/F
Women and minorities are encouraged to apply.

Arthur Young is only interested in EDP Professionals who see their positions a bit differently.

As a continuing challenge, instead of a calculated survival.

As an opportunity to use your technical expertise, creativity, and business acumen to excel—and to receive rewards directly tied to your performance.

As one of three or four uncommon people in your area who will grow as a consultant with Arthur Young's Information Systems Consulting Practice.

You must be a highly qualified and experienced EDP Professional, in areas such as Systems Planning, Project Management, or Systems Design and Implementation. Or a Technical Specialist in areas such as Telecommunications, Database and Operations Center Management.

You must be comfortable in a position where you will work with top management in both the private and public sector.

You must demonstrate a talent for leadership, and be the type of person who pursues goals aggressively.

That's the kind of difference we're looking for.

Perhaps five percent of you can realistically see your future position in this way.

If you're among that select few, we'd like to invite you to an open house in your area. Contact the Arthur Young Representative nearest you as soon as possible for the time and place.

And remember, there's only room enough for those who will make a difference.

Chicago: Wayne Wipert, Management Consultant, Recruiting, (312) 645-3160. Tuesday, January 24.

Dallas: Phil Scott, Partner, Information Systems Consulting, (214) 969-8609. Saturday, January 14.

Los Angeles: Roger Ferrar, Office Director, Management Consulting, (213) 977-3481. Monday and Tuesday, January 16 and 17.

New York: Dave Nugent, Management Consultant, Recruiting, (212) 407-1828. Tuesday and Thursday, January 24 and 26.

Washington, D.C.: John Madden, Office Director, Management Consulting, (202) 828-7092. Saturday, January 21.

ARTHUR YOUNG

The fastest growing research-oriented pharmaceutical company in the U.S. is recruiting for the following positions at its Corporate Headquarters in Research Triangle Park, N.C. (near Raleigh/Durham).

DATA BASE ADMINISTRATOR

This position requires 2 years of data base administration experience with Hewlett-Packard equipment and programming and COBOL.

PROGRAMMER/ ANALYSTS

These positions require 2 years COBOL programming experience on Hewlett-Packard equipment with manufacturing/accounting/personnel applications background.

Raleigh/Durham is located in the rolling Piedmont area of North Carolina and offers access to 3 nationally recognized universities, numerous cultural opportunities and nearby recreational opportunities.

The Company offers a competitive salary, benefits and relocation package. Send your resume, indicating the position that you are interested in, to: **Personnel Manager, GLAXO INC., P.O. Box 13398, Research Triangle Park, N.C. 27709.**

(No Private Agency Referrals Please)

When you lease equipment, make sure it comes with a good name behind it.

With the rapidly changing and improving technology of your industry, it's not always easy to keep your company's system up to date. And it's important to make sure you get the best advice, the best service, and the best financing available.

At Greyhound Computer Corporation, we've been leasing, servicing, refurbishing, maintaining and providing financing for computer and other equipment for over 20 years. And we have the resources and the knowledge to help you customize your equipment-leasing requirements. We can also assist you with the financing.

Whether you want to lease or purchase your equipment, look for the name with the kind of strength you need behind it: Greyhound.

HOW TO SAVE
$30,000
PER MONTH
ON A 3083 LEASE.

Lease the same 3083 that IBM leases for over $92,000 per month from Randolph—for less than $62,000 per month. That adds up to savings of $1,440,000 over a four-year lease period. If you're renting an older machine, Randolph may save you even more—and you'll get about four times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH ABOUT LEASING A 3083?
Now—because Randolph has 3083's available for 4th quarter delivery. But it's never too late, even if you already have a machine installed. Whatever your situation, we can tailor a lease that will fit your exact needs and let you start saving money right away.

TALK TO RANDOLPH NOW.
We can solve problems like these, and more . . .
Stuck with a lease on your old machine?
We'll sublease it, and provide a new lease on a 3083.
Own a 3083 but need cash?
Sell your machine to Randolph, and we'll lease it back to you.
Machine installed on a rental basis?
We'll show you how to end the lease and install a new 3083. Any termination charges can be folded into your new Randolph 3083 lease.

LEASING COMPUTERS IS OUR ONLY BUSINESS.
At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE LEASE MORE THAN 3083's.
Whatever your needs, now is the time to talk to Randolph. We provide leases for IBM 303X, 4300 and 3081 systems and peripherals—disks, tapes—as well as 3083's.

UNIQUE FINANCIAL STABILITY.
We're an important part of one of the nation's oldest and leading financial institutions . . . The First National Bank of Boston. 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU SAVE $30,000 PER MONTH.
We can solve a lot of problems for you, and save you money, too. Talk to Randolph now . . . call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

HEWLETT PACKARD

BIDS & PROPOSALS

AURORA, COLORADO

The City of Aurora is requesting proposals for a computerized mapping and information system. Proposals will include both hardware and software to meet the requirements of the Engineering, Utilities, Planning and Data Processing Departments.

PRE-PROPOSAL CONFERENCES will be held January 24, 1984 at 10:00 A.M. Mountain Standard Time. This conference is optional and vendors must notify Aurora Contract Administration if they plan to attend.

Proposals will be accepted until 2:00 P.M., February 13, 1984. Specifications may be obtained from the City of Aurora, Contract Administration Office, 1470 S. Havana Street, Aurora, CO 80012, phone (303) 695-7340, on or after January 16, 1984.

AUCTIONS

AUCTION

The undersigned will sell at Public Auction on Tuesday, January 10, 1984 at 10:00 a.m. EST the following goods:

Two (2) Datamedia DS-1000 Graphics Terminals
Two (2) Datamedia DS-2000 Graphics Terminals
One (1) Datamedia DSG-7000 Graphics Terminal
CPT Word Processor system with Qume printer
One (1) each:
ADT 10A Jet Printer
REC Typewriter 5000
DECWriter II LA 120-AA terminal
DECWriter II LA34-EA terminal
Data Media CRT
Hazeltine 2000 printer

The auction will take place on the premises of Computerve Incorporated, 3100 Wilson Road, Columbus, Ohio, 43228.

The terms of the sale are a minimum down payment of 25% in either cash, certified or cashier's check, on the date of sale with the balance due within 24 hours. Delivery shall take place upon receipt of the last payment plus. All goods are sold "as is." The undersigned reserves the right to reject any or all bids and to bid on and purchase any or all of these goods.

The goods shall be available for inspection at the auction location between 1:00 and 3:00 p.m. on Monday, January 9, 1984 or at other times by contacting Tony Gaines at 614-457-9558.

SOFTWARE FOR SALE

Need general accounting software for IBM System/38?

We've simply solved your problem.

LAWSON ASSOCIATES has solved it with the first general accounting software specifically designed for IBM System/38. Not merely compatible, but state-of-the-art to fully utilize your computer's capabilities. Compare. You won't find a total software solution like it anywhere else.

DESIGN FEATURES: They include: on line systems using data base management; menu driven, user friendly programs written in RPGIII, the System/38 language; and integrated modules. Their benefits: ease of installation and use, plus maximum employee productivity.

INTEGRATED MODULES: Those available include: General Ledger and Report Writer/Accounts Payable/Accounts Receivable/Fixed Assets/Payroll/Personnel/Purchase Order/Order Entry/Inventory Control

SERVICE FEATURES: Fully documented and supported. Onsite training and implementation. One year warranty. Available now for immediate installation.

For more information, please call or write:

Software Tools for VAX/VMS

Make more of your VAX with packages from Evans Griffiths & Hart, Inc.

- **ROSS/V,** a RSTS/E subsystem for VAX/VMS written in VAX-11 MACRO. RSTS/E monitor calls are performed in VAX native mode; the rest of your PDP-11 code (run-time systems, TKB, applications, etc.) is performed directly in the PDP-11 microcode that's present in every VAX. ROSS/V provides the quickest way to migrate from RSTS/E to the VAX and a convenient way to do RSTS/E development on your VAX. While some VAX users are working in native mode, others are simultaneously working under ROSS/V's RSTS/E subsystem. Supports an extensive subset of RSTS/E monitor calls. Provides most of the standard RSTS/E features, like CCLs, send/receive, and RSTS/E-style file update mode. (ROSS/V is also distributed by Online Data Processing, Inc.)
- **KDSS,** a complete multi-terminal key-to-disk data entry subsystem. Eliminates the need for keypunching and stand-alone key-to-disk systems. (Also available for RSTS/E and RSX-11M.)
- **TAM,** an efficient multi-terminal screen-handling facility that provides complete support for the development of transaction-processing applications on a wide variety of terminals. (Also available for RSTS/E and RSX-11M.)
- **VSORT,** a powerful sort that is very much faster than SORT32. Sorts sequential and relative span and nospan files.
- **VSELECT,** an extremely fast package for scanning RMS files to extract and reformat records that meet user-specified selection criteria. Use VSELECT and VSORT to reduce the number of secondary keys you need in indexed files: you can select records from an indexed file and sort them in less time than it takes to run CONVERT on the file.
- **BSC/DV,** a VMS device driver for the DEC DV11 synchronous multiplexer. Suitable for handling a wide variety of bisynchronous protocols. (Also available for RSTS/E.)

Call or write for complete descriptions of features and benefits.

WANTED:
TIME ON BURROUGHS MAINFRAME

Fast growing corporation headquartered in Memphis, Tennessee wants to contract time on a large scale Burroughs system. Requirements call for major use of the mainframe system, shared or dedicated, for an on-line application during the hours 7 a.m.-9 p.m. Monday through Friday. The system must be up by March, 1984. This arrangement will require very little time and no investment by you. We will pay top dollar. Reply to:

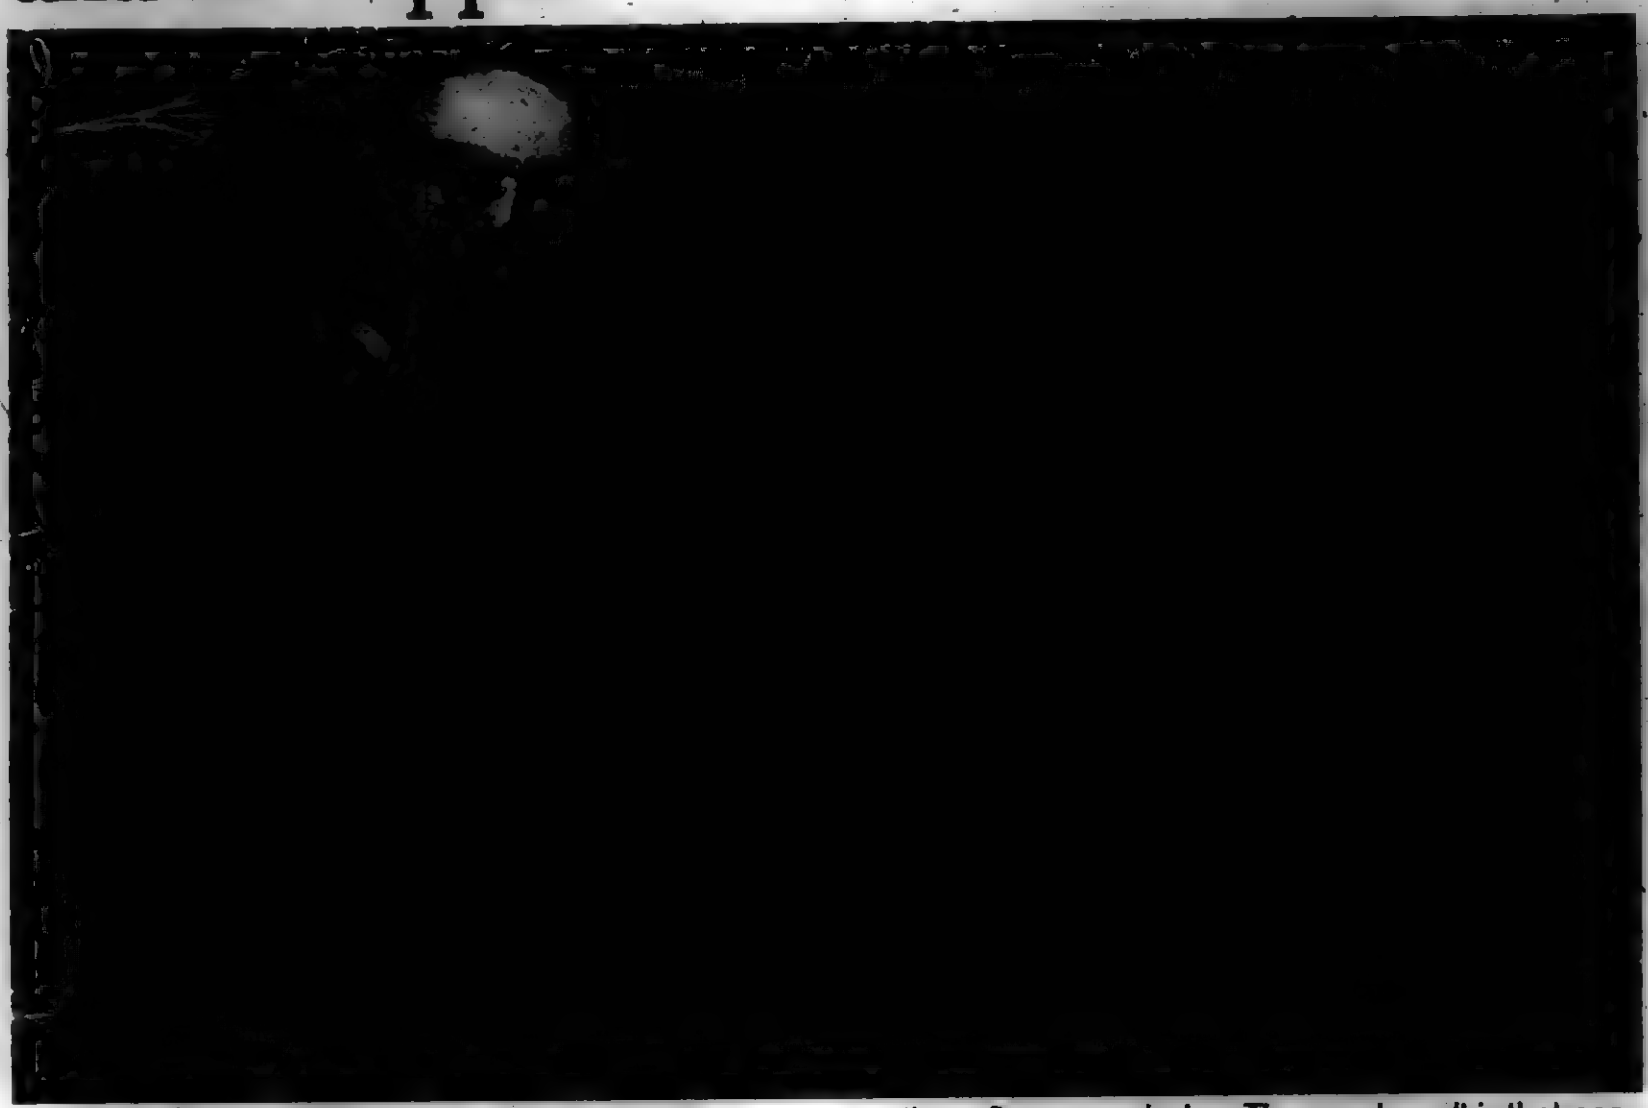
The man who taught financial software to A.B. Dick, Alberto Culver, Hershey Foods, Hartz Mountain, Howard Johnsons, Newsweek, National Steel, Philip Morris, Parker Pen, Pabst, Pillsbury, Pepsi-Cola and Dr Pepper.



He's Alan Rick, a McCormack & Dodge training instructor. A member of a teaching team which has won the reputation, hands-down, for the best hands-on training in the financial software industry.

Clients find our training schools as valuable as our software packages. Enrollment has grown from less than 300 in 1977 to over 3,000 in 1981. People have come from more than 150 Fortune 500 companies. From departments with such demanding workloads that any system but the fastest and most powerful is simply out of the question. Whether it's for accounts payable, capital projects analysis, fixed assets, general ledger, payroll/personnel or purchase order management.

At McCormack & Dodge, we work hard to make our schools—and our entire company—as user-oriented as the software we design. The usual result is that people who sit down and talk to us do more than just talk. They become customers. We'd like to show you why.

Tomorrow's software today.

☐ General Ledger ☐ Payroll/Personnel
☐ Accounts Payable ☐ Purchase Order Management
☐ Fixed Asset Accounting ☐ Capital Project Analysis

AT&T: Keep access fees, we'll cut rates

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — AT&T may increase its private-line rates only 7.9% overall — rather than the 15.5% originally planned — if the Federal Communications Commission implements its plan to charge users for access to the long-distance network. The company said it might also decrease Message Toll Service and Wats charges more than the 10.5% promised earlier.

Both offers were included in comments AT&T submitted to the commission Jan. 6. They appear to be part of an intense lobbying campaign aimed at Congress; AT&T has also sent nearly two million brochures and letters to community leaders, shareholders and employees.

A bill passed by the U.S. House of Representatives, H.R. 4102, forbids the FCC from putting the access charge plan into effect. Similar legislation (S. 1660) is awaiting a final vote in the Senate.

The White House opposes these measures, as do many corporate communications users and telecommunications vendors. The latter two groups have formed an Alliance for Telephone Progress to seek changes in the legislation (story on page 2).

The original private-line increases and MTS/Wats decreases proposed by AT&T last Oct. 3 could be changed, AT&T said, because the company overestimated the access charges it would have to pay under the FCC's

Data base unit announced for IBM sites

By Paul Gillin
CW Staff

LOS ANGELES — Teradata Corp. today announced an integrated hardware and software data base computer for IBM mainframe environments that reportedly manages databases of up to one trillion bytes.The fault-tolerant data base computer, dubbed DBC/1012, uses more than 1,000 Intel Corp. 8086 microprocessors running in parallel.

The DBC/1012 is believed to be only the second data base machine available for IBM mainframes. Software AG of North America, Inc. markets the Data Base Machine, a back-that includes the company's Adabas data base management system. However, Software AG has downplayed the processor in recent product literature.

Teradata's basic model includes six microprocessors equaling 12M bytes of main memory, 1.9G bytes of disk storage, relational software, host interface software and data base utilities. It performs 2.5 million instructions per second.

Parallel microcomputer modules and disk storage can be field upgraded to achieve a maximum of 400 Mips with a capacity of up to 2G bytes of main memory, a spokesman said. All modules communicate via Teradata's Ynet, a multiprocessor interconnection that distributes data and processing functions over multiple subsystems. Ynet broadcasts request messages to the microprocessors and merges their results in sequence, the

FYI

A fearless Fortran forecast: Redskins by six

By Bruce Heard
Special to CW

LOS ANGELES — There have been times in the past when fearless Fortran forecaster Bud Goode has equivocated when asked to pick the next Super Bowl champion.

"I don't believe the computer," he complained.

"It's a dismal science," he decried.

No more. The computer says Redskins by six over the Raiders in Super Bowl XVIII, and that's good enough for Goode. The forthright forecaster was even willing to hazard a guess at the Jan. 22 event's final score: Washington Redskins: 21, L.A. Raiders: 17. Or 14. Something like that.

Goode's computer is a Sperry Corp. 1106 mainframe, and he uses it to compile a weekly 80-page readout that was sold to nine National Football League coaches and CBS commentator Dick Vermeil this past season. The software that drives the 1106 is based on a regression analysis that includes 120 variables covering virtually every phase of football.

Although not a betting man himself, Goode handicaps NFL games each week during the 16-week regular season for *The New York Post* and *The Philadelphia Enquirer*, among others. After experiencing stunning success against the line last year, he sank to two games below .500 against it this season. "I expected to fall out of bed this year because of statistical variations," he noted matter-of-factly.

During the course of the season, several teams jockeyed for statistical supremacy in Goode's Super Bowl race. In the American Football Conference, the L.A. Raiders did not emerge as the favorite until the 12th week. Before that, San Diego — Goode's preseason pick — Miami and Pittsburgh all enjoyed front-runner status. In the National Football Conference, Washington, the defending Super Bowl champion, supplanted Dallas as the favorite early in the season and stayed there.

In the Redskins-Raiders match, the Redskins are very strong statistically in ball control. According to Goode, the Super Bowl champions will typically run the ball 10 times per game more than their opponents during the regular season. The Redskins almost doubled that number, upping it to 17.

"It's a big edge because of the clock-eating ability," he pointed out.

Washington led the NFL in scoring with a 33.8 point average, a 40-percentile advantage over the Los Angeles defense, which relinquished a not-too-stingy 21.1 points per game.

Redskins' John Riggins

Alliance to monitor legislation

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — "To ensure passage of legislation responsive to the reasonable concerns of business and protective of America's technological future," several corporate communications users groups and trade associations last week announced they have formed the Alliance for Telephone Progress (ATP). The group's initial goal is to amend telecommunications legislation now before the U.S. Senate.

Meanwhile, in related actions:

■ The Reagan administration has announced it will oppose the pending Senate legislation (S. 1660) which would bar the Federal Communications Commission from putting its proposed access charge plan into effect. The Senate is likely to vote on S. 1660 next week.

The latest views of the Reagan administration on the pending legislation came in a statement made by a White House spokesman earlier this month claiming, "We support a deregulatory move as being in the best interest of the industry as well as individual consumers.

"We're concerned about initial consumer costs but believe that in the long term, these will iron themselves out."

■ AT&T offered to reduce its Message Toll Service/Wats rates beyond the levels promised last October and also offered to scale back increases in private-line rates proposed at that time (see story on page 1). The October announcement concerned a new interstate (between local access and transport areas) tariff, based on the FCC's access surcharges.

■ An AT&T spokesman said the company mailed nearly two million announcements of the new offer to its shareholders and employees, local opinion molders and the general public.

■ A knowledgeable Washington, D.C., source said the FCC is "caught between a rock and a hard place: While Congress objects to the access surcharge, the carriers and business communications users insist on it." He believes Congress and the commission will decide to defer the access charge for several months despite objections from users, telephone carriers and possibly Federal District Court Judge Harold Greene, who presided over the AT&T divestiture.

This Thursday the commission may act on petitions for further reconsideration of its access charge decision.

A press release issued by the newly formed ATP last week estimated that if S. 1660 or a similar measure in the House of Representatives (H.R. 4102) is enacted, their members' communications bills will increase between 40% and 200%.

Members of ATP include the International Communications Association, Association of Data Processing Service Organizations, Committee of Corporate Telecommunications Users, National Retail Merchants Association, Electronic Funds Transfer Association and Aeronautical Radio, Inc.

RATES from page 1

new plan.

However, "if the access charge plan were to be modified, either by commission action or congressional mandate, to reduce or to eliminate the fixed monthly end-user fee or to increase the amount of the discount for other common carriers, AT&T's ability to offer any rate reductions would be jeopardized.

"In fact, such changes could eliminate the MTS and Wats rate reductions already proposed in the Oct. 3 filing."

Key part of plan

A key part of the FCC's access charge plan is a fixed monthly surcharge of $2 per month per line on the local telephone company's residential users and up to $6 per month per line on business users.

The plan also calls for reducing the differential between what AT&T and the other common carriers now pay for access to local telephone networks. Other common carriers are now charged far less for lower quality interconnection, AT&T said.

AT&T said that, because of uncertainty concerning the FCC plan and the related access charges that local telephone companies will levy on AT&T and other long-distance carriers, it could not estimate how much more MTS/Wats rates might come down. But the company promised to pass on to customers all of the savings.

Criticisms rejected

AT&T rejected criticisms from users that the rate reductions proposed last October represented only about half of what it would save in reduced costs stemming from the FCC decision.

Column 1	Column 2 (Percent)	Column 3 (Percent)
Private-line services (overall)	15.3	7.5
Voice-grade services (overall)	15.9	8.5
Dataphone Digital Service (DDS)	-3.8	-31.2
2,400 bit/sec DDS	74.3	38.1
4,800 bit/sec DDS	19.8	-1.0
9,600 bit/sec DDS	0.5	-30.5
56K bit/sec DDS	-38.0	-44.6
Telegraph-grade services (overall)	65.9	30.7

The table above shows how present rates for specified services (Column 1) would be affected by AT&T's Oct. 3 tariff (Column 2) and by the possible revisions offered by the company last week (Column 3). All figures were supplied by AT&T, which emphasized that they are tentative.

In the original tariff, AT&T increased individual private-line rates by widely varying amounts. Generally, the decreases were greatest for the most competitive offerings.

While charges for telegraph-grade service went up 65%, for example, those for 56K bit/sec Dataphone Digital Service (DDS) circuits dropped 38%. An AT&T spokesman said last week that, tentatively, the company now estimates that rates for telegraph-grade services will increase only 30.7%, while those for 56K bit/sec DDS will drop 44.6% (see table).

FCC asks AT&T to justify rates further

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — AT&T last week received a 20-page letter from the Federal Communications Commission that asked for further justification of the post-divestiture rates the company proposed last October.

The pending tariff, scheduled to go into effect April 3, will "have a dramatic effect upon charges paid by subscribers," wrote Jack D. Smith, chief of the FCC's Common Carrier Bureau.

By next Monday, Jan. 23, Smith wants AT&T to answer a number of questions that the bureau's staff raised after perusing last October's filing and questions that customers raised in comments submitted to the FCC.

For example, the American Library Association, together with two regional library network operators, complained that charges for communicating over regional bibliographic networks would go up 37% to 84%.

AT&T was asked to respond to these and all of the other customer complaints individually. In each case, the FCC wants a breakdown of present and proposed charges and a comparison of the Total Service and Transport Circuits Service options offered in the tariff.

Under the former option, AT&T would provide an end-to-end service, obtaining the customer's local access facilities from the appropriate local telephone company. Under the latter option, the customer would acquire his own local access facilities, obtain the interexchange circuit from AT&T and retain responsibility for end-to-end testing and maintenance.

As part of its response to each customer complaint, AT&T was asked to "fully explain and justify price differences between . . . alternatives by rate element."

Other customer complaints included several from news services employing multipoint private lines comprised of voice-grade and telegraph circuits now provided under AT&T's Tariff 260.

"The contentions of unreasonable increased rates go both to recurring and nonrecurring charges proposed for these services," the commission's letter said.

The letter also reported that one multipoint network customer — Bunker Ramo Corp. — contends that "AT&T's recurring charges for terminating channels are substantially higher than would be incurred by customers acquiring them directly from [a local] exchange carrier."

Bunker Ramo reportedly also contended that, overall, the Total Service charge exceeds the cost of acquiring the service elements separately, under the Transport Circuits option, by 46% to 50%.

Port Authority bypasses Nynex for PBX

By David Myers
CW New York Bureau

NEW YORK — The Port Authority of New York and New Jersey has bypassed Nynex, the regional telephone holding company carved out of the old New York and New England telephone companies, to set up its own private branch exchange (PBX) at the Port Authority Bus Terminal here.

Closely following two other major bypass decisions in New York, the Port Authority decision raised questions about Nynex's ability to hold onto its lucrative Manhattan base.

AT&T Chairman Charles L. Brown told securities analysts here last month that Nynex was more vulnerable to bypass operations than were the other six operating companies because of the heavy concentration of business and government offices in Manhattan.

Purchased SL-1

The Port Authority purchased a $650,000 Northern Telecom, Inc. SL-1 digital PBX from Standard Telephone, a South Hackensack, N.J.-based dealer for Northern Telecom, and installed the system to handle its automatic call distributing. Jack Gavigan, supervisor of telecommunications services for the Port Authority, said the agency had gone to a Northern Telecom PBX out of unhappiness "with the service the telephone company provided. We were getting complaints from the general public attempting to get bus information."

Asked if officials at the Port Authority were concerned about weakening Nynex, Gavigan replied that "our real concern was whether they [Nynex] could be relied upon. It is increasingly the case that people in my position are becoming dissatisfied with the response time and other services" of what was formerly known as New York Telephone Co.

The Port Authority has now become the second public agency in the state to bypass the phone company, joining the New York State government in sealing a deal with an unregulated carrier [CW, Sept. 26].

VOTERS

Thanks for giving SyncSort 75% of the vote in IDC's 1983 Sort Survey.

Call (201) 568-9700.

If you're still in the "sorting minority."

Ladies and gentlemen...sort users...fellow Americans: As we stand before you today on this windswept Inaugural Platform, clutching our notes, we are both very proud and somewhat puzzled.

We're proud that SyncSort has again been re-elected to office as "America's No. 1 Sort Program." It's now used by a whopping 75% of America's major data processors, according to the latest IDC sort survey. Here's the final vote tally:

SORT PROGRAMS IN USE IN THE U.S.*

But proud as we are of this achievement, we're puzzled, too. How come 25% of you are still procrastinating about SyncSort? You use the best hardware, and sooner or later you're going to want the best sort program to make that hardware work even better.

If you'll call, we'll prove to you that all three versions of SyncSort—OS, DOS and CMS—are clearly superior to their IBM counterparts in the three critical areas of sorting:

1. PERFORMANCE. Sorts have a built-in "Tammany Hall factor." If they run inefficiently, they can embezzle a great deal of your computer resources and corrupt your entire system's throughput.

SyncSort prevents this by keeping sorts honest. Because of the technological breakthroughs we pioneered—many of which are now patented—all three versions of SyncSort use far less computer resources than any of their IBM opposite numbers. Just how great the sort-performance gap has become can be seen by the charts at lower left.

2. PRODUCTIVITY. There's more to sorting than sorting. SyncSort is loaded with sophisticated features that make it easy to perform other important data-processing functions. Using these features, the time required for simple applications can often be reduced from five programmer days to one. Another reason why SyncSort has always carried the programmer vote!

3. SERVICE. We never forget who elected us to office. When you need sorting help, our Technical Service people will provide fast, accurate, courteous sorting advice. More than 85% of all customer inquiries are resolved within 24 hours.

To the 75% who cast their ballots for SyncSort, our warm thanks. And to the 25% who didn't, better call us today. Why postpone the inevitable?

*According to IDC's Seventh Annual Survey of Sort Programs Used in OS and OS/VS.

IBM adds one System/38, scraps three, cuts prices

By Tom Henkel
CW Staff

RYE BROOK, N.Y. — IBM last week scrapped three older members of its System/38 processor lineup, announced a mid-range System/38 processor and slashed prices on the remaining two processors in the line.

Highlights of the announcement include:

■ The introduction of the System/38 Model 6, a mid-range processor that reportedly offers 2M to 4M bytes of main memory and the ability to connect up to 128 local workstations. The Model 6 replaces the older Model 5 and Model 7 processors, which IBM will no longer market. IBM said the Model 6 offers about 25% more internal performance than the Model 5, with a purchase price of about 8.9% less.

■ The elimination from the System/38 family of the entry-level Model 3, a processor that many industry watchers maintained did not offer enough main memory to fulfill users' needs. Most agreed the Model 3 was never a strong contender in the System/38 lineup.

■ Decreases in the purchase prices of the remaining two processors in the System/38 line by as much as $32,500 on the Model 8 and $17,500 on the Model 4. IBM also made some minor enhancements to those processors.

■ The announcement of an electronic spreadsheet program, Worksheet/38, as part of IBM's Office/38 program product.

Faster storage cycle time

The System/38 Model 6 features a control storage cycle time of 133 nsec, compared with 200 nsec on the older Model 5. Main memory cycle time on the processor is 400 nsec, compared with 600 nsec on the Model 5, IBM said.

The Model 6 is available in 2M-, 3M- and 4M-byte memory configurations. The Model 5 offered 1M, 1.5M and 2M bytes of main memory.

In addition, the Model 6 can accommodate 12 more local workstations than the Model 5, IBM noted.

The Model 6 processor with 2M bytes of main memory, 794M bytes of disk storage, 20 workstations and a system printer costs $180,423. The unit costs $3,561/mo on a five-year lease plan. A similarly configured Model 5 processor formerly cost $189,453.

The Model 6 will be available in March, IBM said.

Models 4, 8 enhanced

Besides getting price cuts, the Model 4 and Model 8 processors also were enhanced. Presumably to fill the void left by the Model 7 processor, the Model 8 is available with 2M- or 3M-byte memory configurations; its previous minimum main memory capacity was 4M bytes.

The Model 4 can accommodate 12 additional local workstations, raising the maximum number of terminals from 20 to 32. The additional terminals can be attached without an expansion feature, IBM said.

The newly announced spreadsheet program, Worksheet/38, enables users to develop relational models for planning and budgeting applications. The package, which can access information stored in a System/38 data base, is available for a one-time charge of $2,700, an IBM spokesman said.

Last week's System/38 announcements were made through IBM's Information Systems Group, located at 900 King St., Rye Brook, N.Y. 10573.

Characteristics \ System	System/38 Model 4	System/38 Model 6	System/38 Model 8
Relative Performance[1]	13	20	32
Mips[2]	.2	.3	.52
Memory Size in Bytes (Minimum-Maximum)	1M-2M	2M-4M	2M-8M
Purchase Price[3] (Memory Size)	$48,140 (1M)	$67,903 (2M)	$137,806 (4M)
Lease Price (Lease Term)	$2,903 (3 Year)	$1,754 (5 Year)	$8,400 (3 Year)
Machine Cycle Time (Nsec)	1,100 (Per 4 Bytes)	400 (Per 4 Bytes)	400 (Per 4 Bytes)
Channels[4] (Minimum-Maximum)	1	1	1
Cache (Buffer) Size	None	None	None
Bus Architecture?	No	No	No
Price per 1M Byte Of Main Memory	$7,900	$7,900	$7,900

1. CW estimates based on vendor-supplied information. Relative performance ratings are based on an IBM 370/158-3 equating 45. These numbers are designed to put the processor into perspective with other systems; they do not constitute a buyer's guide. All systems are not alike; they use different operating systems, instruction sets and architectures and therefore cannot be directly compared. In addition, actual relative performance may vary with the application, peripherals and software.
2. CW estimates.
3. For the processor only.
4. The System/38 has one channel through which many devices can be used.

NCR unveils terminal system to fit IBM's 3270, SNA/SDLC

DAYTON, Ohio — Citing its intention to offer communications compatibility with IBM, NCR Corp. last week announced a general-purpose cluster terminal system that is compatible with IBM's 3270 line of terminals and IBM's Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC).

The NCR 7950 terminal system is comprised of either 15-in. monochrome display terminals (green or amber) or 14-in. color display terminals, a 200 char./sec printer and a controller that can support up to 32 CRT terminals or printers. The controller is based on a Motorola, Inc. 68000 microprocessor.

NCR plans to market the unit to large corporations that have a need for clustered CRT terminals that can communicate with a host processor in a 3270 SNA/SDLC environment. A spokesman said NCR is targeting both NCR users and users of other vendors' systems.

According to NCR, the 7950 can be used in lieu of a microcomputer, but the company did not elaborate.

The introduction of the NCR 7950 marks the first time NCR has announced a 3270-compatible product, the spokesman added.

Features of the 7950 include a data field storage facility for commonly used word sets. The feature can be recalled on the screen as needed.

In addition, a printer buffer is available to store screen contents when the printer is busy.

Add-on features

The 7950 was designed to enable customers to buy entry-level configurations similar to the IBM 3178 CRT terminal introduced last year [CW, March 14]. The 7950 accommodates add-on features, many of which are user installable and do not require users to replace CRT terminals, the vendor said.

Other features include a tilt-and-swivel display, 24 function keys and a 10-key numeric pad.

The 7950's basic monochrome display terminal costs $1,395. A seven-color display terminal costs $3,350, and a printer for the unit costs $5,000. The 68000-based controller costs $6,000.

NCR's world headquarters is located at 1700 S. Patterson Blvd., Dayton, Ohio 45479.

IBM doubles memory on System/36 to 1M byte

X.25 support also announced

RYE BROOK, N.Y. — Besides adding to and subtracting from its line of System/38 processors last week, IBM also doubled from 512K to 1M byte the maximum main memory available on the smaller System/36.

In addition, the firm announced support for the X.25 communications protocol on the System/36 and introduced a remote cluster controller.

All System/36 configurations are available with a main memory maximum of 1M byte. The main memory enhancement is available in 256K-byte increments, which cost $2,500 each.

Disk storage expanded

The maximum amount of disk storage for the System/36 has also been expanded, from 400M to 800M bytes. The disk storage expansions are available in 200M-byte increments, costing $17,500.

Both memory enhancements will be available in May. A System/36 processor with doubled main memory and disk storage is priced at $107,600.

Further System/36 enhancements announced last week include the ability to add six extra local workstations, bringing the maximum number of local workstations to 36. That means up to 100 local and remote workstations can be added to the System/36; the previous maximum was 94.

The System/36 can be used in an X.25 network operating at 2,400, 4,800 or 9,600 bit/sec.

The remote cluster controller features an external modem adapter operating at 2,400 to 19.2K bit/sec; distributed data services operating between 2,400 and 56K bit/sec; and support for the X.21 and X.25 communications protocols. The unit costs $2,950 and will be available in May, according to the vendor.

More information is available from IBM's Information Systems Group, located at 900 King St., Rye Brook, N.Y. 10573.

'CA-Executive' integrates software for IBM micro

Offers applications, mainframe link, multitasking, windowing

By Paul [illegible]
CW Staff

JERICHO, N.Y. — Computer Associates International, Inc. last week announced a software product for the IBM Personal Computer that integrates a range of popular applications software, an intelligent link to IBM mainframes, multitasking capability and a window manager.

Called CA-Executive, the product will be geared toward Fortune 1,000 companies in which microcomputer users are buying too many different kinds of micro software, according to Charles Wang, Computer Associates president. In a departure from its traditional sales strategy, the company will sell CA-Executive to executive end users as well as to data processing personnel.

Computer Associates is providing discounts of nearly 50% for orders of more than 50 copies of the product, whose single-unit price is $1,295.

Slated for availability in April, CA-Executive includes a data base management system (DBMS) called CA-DBMS that incorporates a command structure virtually identical to that of CA-Universe, the company's mainframe relational DBMS.

Other programs in CA-Executive include a spreadsheet (CA-Calc), word processing (CA-Writer), editing (CA-Edit), graphics (CA-Graph), forms generation (CA-Form), mainframe linkage software (CA-Link) and on-line tutorial (CA-Tutor).

Windowing allows multiple programs to be displayed simultaneously; data can be transferred back and forth between windows.

The link to the mainframe offers on-line uploading and downloading, communications with other Personal Computers on a network and terminal emulation for performing functions on mainframe applications. The software includes an intelligent file transfer capability, IBM 3270 terminal emulation, access to any subset of a CA-Universe data base and dumb terminal emulation for access to external data bases.

Security is administered by the data processing department, and invalid data cannot be transmitted via CA-Link, a spokesman said.

CA-DBMS is a relational DBMS that includes a report writer and security to the field level. CA-Writer is a version of Easywriter II from Information Unlimited Software, Inc., a Computer Associates subsidiary, that includes text and word processing, a spelling checker and electronic mail capability.

CA-Calc is an electronic spreadsheet that is integrated with CA-DBMS to allow data to be transferred between the components without reformatting. CA-Edit is a programmer-oriented tool that provides facilities for processing data, creating and editing files, writing and executing programs and generating reports.

CA-Form is a menu-driven screen painter designed primarily for creating screens, forms and reports. CA-Graph produces most standard graphs in full color. Graphs can be transferred into other windows for composite reports. CA-Tutor is an on-line tutorial that complements written documentation. PC-DOS lets any IBM PC-DOS program execute within a CA-Executive window.

When used with CA-Universe on the mainframe, CA-Executive allows users to manipulate, update and access data within CA-Universe and download a subset of the data or a new table to the micro. The window manager reportedly can be manipulated by function keys or a mouse. Utility windows include a directory, print spool, clock, notepad and Help functions.

CA-Executive is written in C on a Unix operating system with a PC-DOS translator that makes multiprocessing possible, according to Wang.

Computer Associates is at 125 Jericho Tpk., Jericho, N.Y. 11753.

IBM micro gets Unix look-alike

RYE BROOK, N.Y. — IBM announced last week that it will offer an optimized version of Bell Laboratories, Inc.'s Unix operating system for its Personal Computer and Personal Computer XT microcomputers.

The operating system, called the Personal Computer Interactive Executive (PC/IX), was adapted for use on the IBM micros by Interactive Systems Corp., according to an IBM spokeswoman. She added that PC/IX can run virtually all Unix programs commercially available for microcomputers.

The operating system is available for a one-time license fee of $900 and will be marketed though IBM's National Accounts and National Marketing Divisions.

2 Trillion

Last night we backed up two trillion (yes, that's 12 zeroes) characters of data, and checked our work.

VMBACKUP

We bring files back alive, the way they should be—readable, usable—which some "cut-rate" backup systems *don't* do. We verify the data before moving it to tape. That's why 75% of the Fortune 100 companies trust their vital data to VMBACKUP.

How do we do this?

- Start with a solid design.
- Take the best systems people in the VM community.
- Have them build it right.
- Add competent, helpful support people.
- Stay close to our customers.

And we create a winning situation for our users.

VM Software Inc.

IBM, NAS settle case

Suit over trade secrets theft

By Jeffry Beeler
CW West Coast Bureau

SAN JOSE, Calif. — A civil suit in which National Semiconductor Corp. and its National Advanced Systems, Inc. (NAS) subsidiary were accused of stealing IBM trade secrets was settled out of court last week.

In return for IBM's promise to drop all claims against the two defendants, National Semi agreed to pay all the industry giant's legal fees stemming from the 16-month-old suit. The fees total $3 million — a pittance compared with the $750 million to $2.5 billion in damages that IBM threatened last Nov. 15 to demand from NAS and its parent company.

Last week's agreement also gave IBM the temporary right to scrutinize each of NAS' future products prior to first-customer shipment, according to an affidavit filed in U.S. District Court. The purpose of the inspection provision, which expires on Oct. 1, 1988, is to satisfy IBM that none of the company's allegedly stolen trade secrets finds its way into NAS' new processors and other systems modules.

In addition to providing an advance look at the products themselves, the defendants will be required to give IBM access to all NAS' accompanying systems specifications, users manuals, principles of operation and related materials, the affidavit said.

If the two sides disagree over whether a future NAS product incorporates proprietary IBM technology, the dispute will be referred to a three-member arbitration panel whose rulings will be binding.

The panel will consist of one representative from both IBM and NAS, as well as a chairman to be chosen jointly.

In other provisions of last week's settlement, National Semi and NAS have agreed to refrain from using IBM's trade secrets in their new product development and to return any proprietary technology they may receive in the future.

NAS: 'We're quite pleased'

Asked for his reaction to the Jan. 9 settlement, NAS President David Martin voiced relief that his company's long legal ordeal had finally ended. "We're quite pleased with the settlement," he said during a Jan. 10 interview. "The agreement bodes well for the firm's future and eliminates much of the fear, uncertainty and doubt" that IBM's suit had created in the minds of both market analysts and NAS' own customers, he said.

Although National Semi and NAS have steadfastly maintained their innocence in the trade-secrets theft case, they settled the suit anyway, because "nobody, not even the government, has the resources to compete with IBM's legal technology," Martin said.

Since its inception in September 1982, National Semi's legal wrangle with IBM had seriously tarnished NAS' image in the eyes of certain stock analysts and potential investors, Martin said. The civil suit had also prompted at least a few otherwise promising sales prospects to question the Mountain View, Calif.-based firm's viability as a systems vendor.

Roots of the case

In many respects, last week's settlement was closely patterned after a related out-of-court agreement that IBM reached on Oct. 6 with National Semi's Tokyo-based processor supplier, Hitachi Ltd., another defendant in Big Blue's civil suit. The complaint against Hitachi, NAS and National Semi stemmed from a widely publicized industrial espionage case in which two major Japanese electronics vendors were accused of conspiring to steal proprietary IBM systems technology.

To obtain the trade secrets, the conspirators reportedly paid a total of nearly $650,000 to Federal Bureau of Investigation undercover agents posing as electronics black marketers.

Hitachi later pleaded guilty to one count of conspiring to transport stolen property and received the maximum penalty under U.S. law.

In their Jan. 9 court filing, NAS and its parent company repeated their long-standing contention that neither organization had used the pilfered IBM technology, which included MVS/SP Version 2 source code and hardware designs for the 3080 system.

All the IBM product information in the defendants' possession has already been returned to its owner, the papers added.

MSA stock plunges 25% in reaction to flat earnings

By John Gallant
CW Staff

ATLANTA — Despite anticipated record revenues of $145 million in 1983, Management Science America, Inc.'s (MSA) stock plunged more than 25% last Monday, fueled largely by its announcement of flat per-share earnings and a marked decrease in the rate of profit growth in 1983.

While MSA's release of preliminary year-end figures showed that 1983 revenues would hit $145 million, up 44% over 1982, pretax profits are expected to increase only 38% and earnings to rise only 17%. That figure represents a sharp drop from the 63% earnings growth reported the previous year.

The most significant announcement, however, was that MSA anticipates 1983 earnings per share to remain at 1982's 62-cent level. It was that news that sent MSA's stock into a tailspin, dropping from $30 per share to $22.25 at the close of business Monday. At midweek, MSA shares traded at $23.

Commenting on MSA's year-end results, Chairman and Chief Executive Officer John P. Imlay Jr. said the software firm "on balance [was] pleased with the progress made in strengthening our leadership position within the industry." However, Imlay said that foreign revenues, which fell below targeted levels, and a substantial tax rate increase stemming from the "decision to treat [research and development] tax credits in a conservative manner" were problems for the firm.

In addition, MSA announced that while revenues from sales of its manufacturing software quadrupled in 1983, they were still lower than expected. According to President William Graves, manufacturing software sales, such as those for the firm's material requirements planning system, accounted for between only $4 million and $5 million, a figure "below what we wanted."

'Skittish market'

Harry Edelson, vice-president of First Boston Corp., said MSA's stock dip was indicative of a "skittish market in technology issues.

"Wall Street was looking for growth," Edelson said. "A growth company is supposed to grow, and if it doesn't, that's a big problem. When flat earnings come as a surprise, that's a warning that things could get worse. We're seeing a bear market in technology stocks right now as it is. Many are selling from one-half to one-third less than their price a year ago."

Edelson also said MSA's flat earnings might have spurred profit taking among investors.

Robert O'Connor, financial analyst for Tucker, Anthony & R. L. Day, Inc., agreed with Edelson's assessment. In addition, O'Connor cited an estimated tax increase of close to 9% during 1983 and an increase of 19% in the number of MSA's outstanding shares as factors behind the stagnant per-share earnings.

Graves said the company's failure to attain target revenue levels in foreign markets was the most significant difficulty MSA encountered last year. He cited a goal of nearly $35 million in foreign revenues, a level that MSA missed by some $7 million.

Imlay said MSA is "re-evaluating how [it] operates in certain foreign markets in order to improve profits." In addition, the firm will stress the marketing of its manufacturing and order processing products, moves which Imlay predicted would boost 1984 revenues by 35% and earnings per share to more than $1.

NAS to service Magnuson M80s

By Jeffry Beeler
CW West Coast Bureau

MOUNTAIN VIEW, Calif. — Customers who lease Magnuson Computer Systems, Inc.'s M80 series processors from Phoenix Leasing, Inc. will soon gain the option of having their hardware and software maintained by National Advanced Systems, Inc. (NAS).

In principle, NAS agreed early this month to serve as the third-party service representative for Phoenix Leasing's base of Magnuson mainframes, which are plug-compatible with IBM's medium-scale CPUs. Announced Jan. 6, the arrangement marks NAS' debut as a provider of third-party systems maintenance and support services, said NAS Director of Marketing Services Pat Case.

Under the proposed agreement, Phoenix Leasing's M80 users can request NAS' optional Total Support Package, which covers user education and software maintenance, as well as service for any model of IBM or IBM-compatible processor or peripheral. Customers also may opt instead to limit NAS' Magnuson-related support activities to hardware maintenance alone.

The service agreement also calls for Phoenix Leasing, based in Mill Valley, Calif., to give NAS access to its large inventory of M80 spare parts, Case noted.

Many of the parts found their way into Phoenix Leasing's hands from Magnuson's UK subsidiary, which recently declared bankruptcy, said Frank Juliano, the leasing company's director of technical operations.

The agreement in principle is expected to take effect formally soon, probably by the end of the month, according to Alan Cade, NAS' vice-president of strategic business services.

Juliano expects the association between Phoenix Leasing and NAS to be "phased in gradually." As contracts with the leasing company's existing Magnuson users gradually expire, the customers will be allowed to take one of two courses of action: either renew their current service agreements or transfer their maintenance and support business to NAS.

Future users of Phoenix Leasing's Magnuson systems, meanwhile, will receive their maintenance and support almost exclusively from NAS.

ANALYSIS

One market that's not bustling

With its introduction last week of a data base machine for large IBM mainframe environments, Teradata Corp. set its sights on a potentially plentiful market that may also harbor serious dangers.

While many of the largest software firms have explored the feasibility of data base machines in recent years, the market is notable for its lack of activity.

From a cost-efficient standpoint, the technology just has not seemed that attractive, according to Ron Ross, editor of the "Data Base Newsletter."

"The question is whether you can improve productivity enough to make up for the cost of the technology, and so far the answer has been No," Ross said in an interview last week. "Nobody wanted to get out there with a machine that would produce improvements for a year or two only to come up against improved price/performance ratios from the mainframe. IBM has kept that ratio improving so they don't come up against that kind of competition."

Invested $27 million

Teradata has invested $27 million and four years of development in the belief that data base machines are now viable, according to David Clements, Teradata's manager of product marketing.

Clements claimed the market has been weak because current data base machines "are targeted toward an area in which there's not a data base problem yet" because the data bases are relatively small.

Diminishing hardware costs and spiraling personnel expenses in recent years have underscored the importance of improving mainframe response times, Clements said. "With [IBM] IMS programmers making as much as $55,000 a year, hardware has become the cheapest concern."

'Linear improvement'

Teradata believes its data base machine will survive competition from improving mainframe technology by offering power that is based on low-cost microprocessors, which can be added as processing requirements expand. "Adding microprocessors results in a linear improvement of performance," Clements explained.

Ross said the use of a relational data base management system may make machines such as Teradata's DBC/1012 viable. "With relational systems, you're specifying a request for a whole table of data," he said. "This means the amount of communications between the data base machine and the mainframe is minimized."

A large machine of this kind could be useful to companies that are planning on distributing their data base processing, according to Ross.

DBC from page 1

spokesman said.

The computer employs a relational-model DBMS using the Teradata query language, Teqsl, an IBM SQL-like language for data manipulation, query and control.

The Interactive Query Language (Iteq) is provided for nontechnical users employing a terminal connected to the mainframe.

Relieved processing load

DBC/1012 attaches to the host on a block multiplexer channel and communicates source code with the mainframe.

In benchmark tests, according to the spokesman, the data base machine relieved the host of about 40% of the processing load in intensive data base applications.

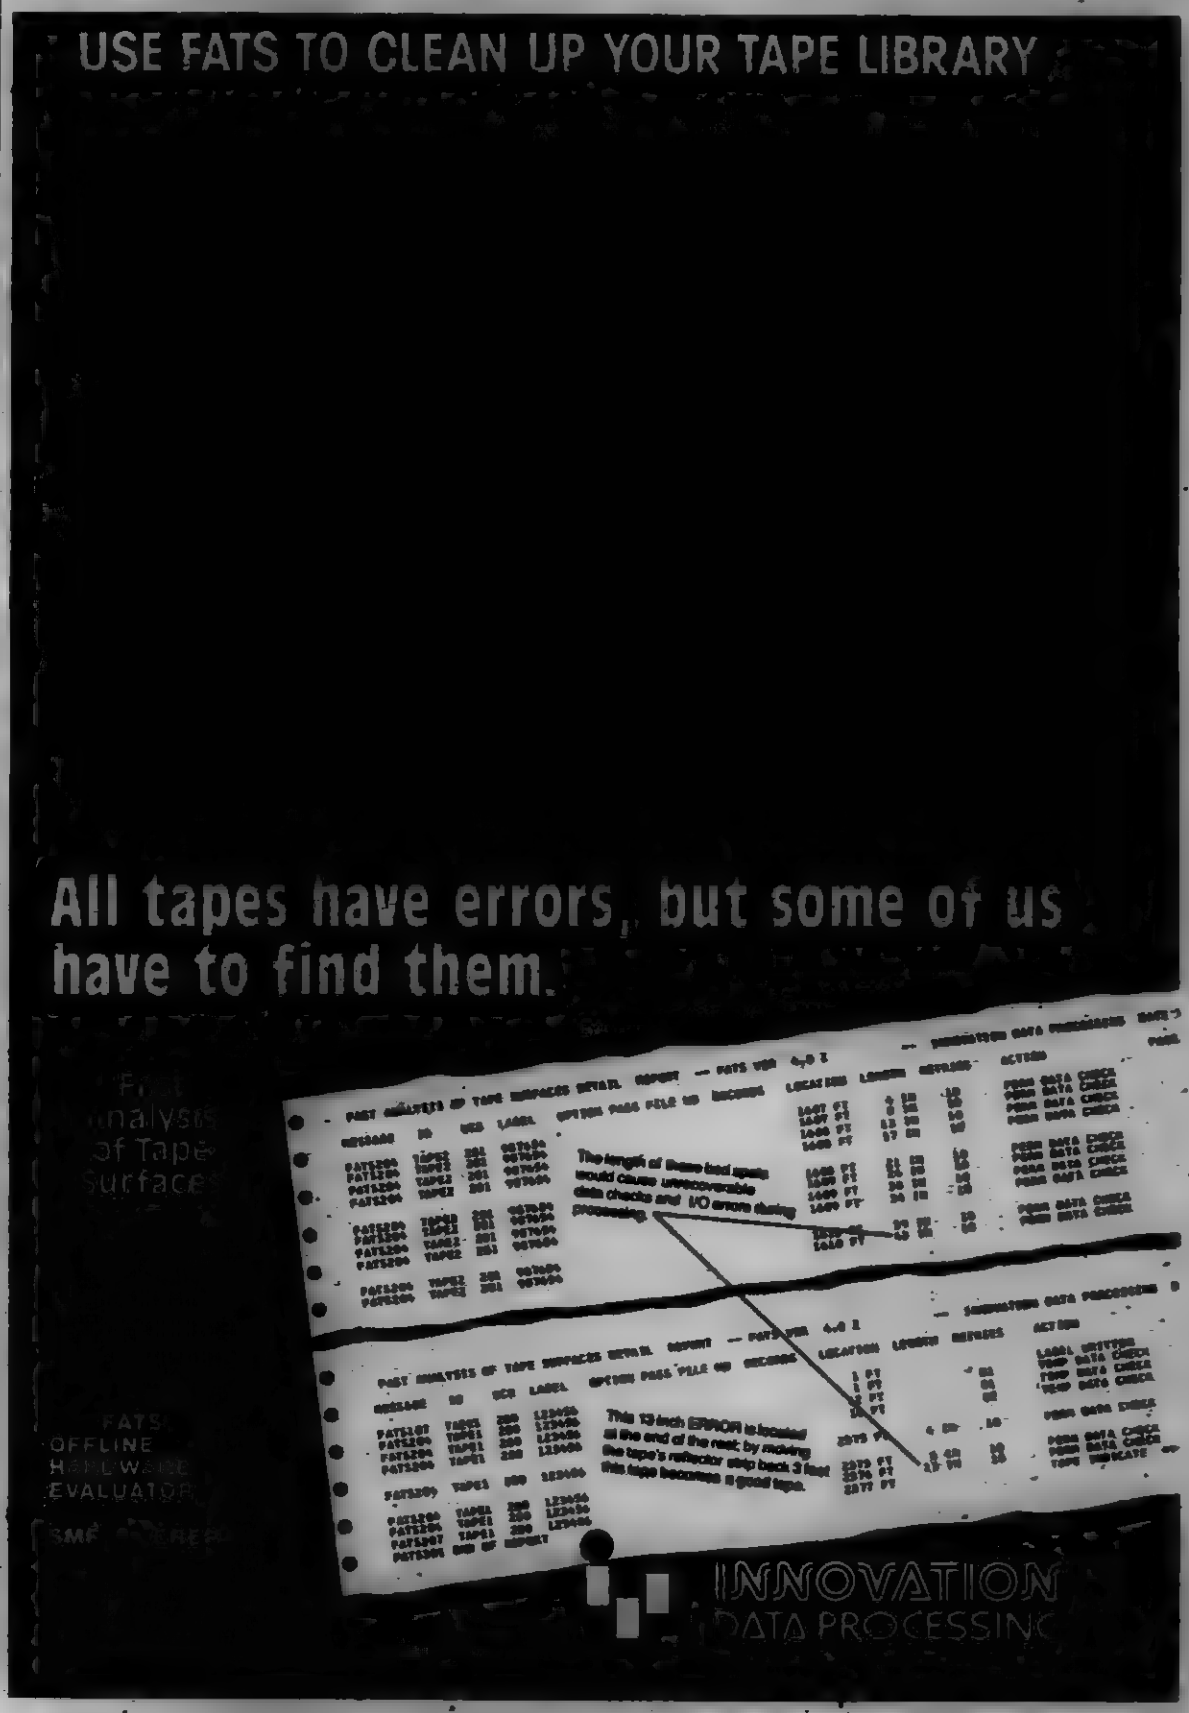
DBC/1012 will be marketed to IBM MVS sites in very large companies with data bases that approach 1T byte, according to David Clements, Teradata's manager of product marketing.

"When you get to that kind of layer, the magnitude of data base problems is tremendous," he said.

Available immediately, the basic DBC/1012 system is priced at $480,000. Add-on components are priced at approximately $60,000 per Mip and $37 per 1M byte of add-on disks, according to a spokesman for the vendor.

Additional information on the DBC/1012 can be obtained from Teradata, which is headquartered at 12945 Jefferson Blvd., Los Angeles, Calif. 90066.

Teradata DBC/1012



Lower cost, flexibility cited as CBT advantages

By Patricia Keefe
CW Staff

NEW YORK — Reduced costs and increased flexibility are the most frequently cited advantages of computer-based training (CBT), according to a survey conducted recently by RSA Information Designs, Inc., a communications and training consulting firm here.

Moreover, IBM's equipment is the hardware of choice for many current and prospective CBT users, according to "The Market for Computer-Based Training in Business and Industry — 1983," the report on the survey's results.

The report is based upon the responses of 74 people in 68 Fortune 500 firms and government agencies regarding their current and planned use of CBT. Fifty-three percent of the 74 work in DP and/or technical training, and 47% work in human resources training — predominantly in financial services, insurance and manufacturing.

Although 60% of the 68 firms polled do not offer CBT, 46% of that group plan to introduce CBT within one year and 17% within two to five years.

Of those organizations currently offering CBT, most use it primarily to provide training in DP and technical skills and in software application usage. However, they are considering using CBT to teach a wider range of topics, the study said.

For example, while product knowledge and management development topics make up about 4% of current courseware, they represent 29% of potential future offerings. Also, basic, clerical and selling skills courseware represents 8% of current offerings and 22% of possible future offerings.

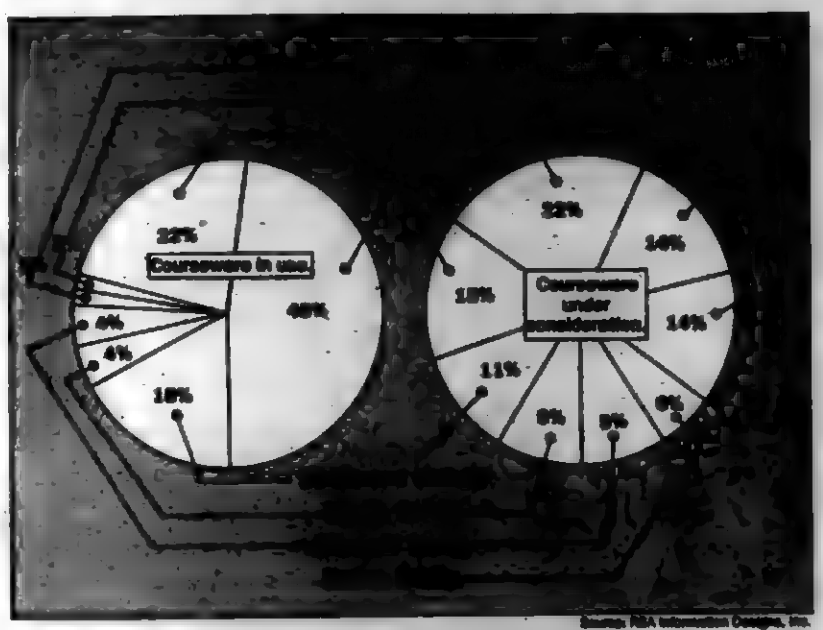
Advantages and difficulties

Among the benefits anticipated from CBT are reduced costs as a result of reduced travel to take training courses, study respondents reported. Other participants pointed to the benefits of student self-pacing and open scheduling, which they said provide flexible, accessible training.

Moreover, the study found that respondents credit CBT with fostering improved or faster learning and course-completion rates.

The greatest difficulty associated with CBT usage was focused on authoring or developing courseware (32%), the management of resources and facilities (22%) and cost (12%), according to the study.

The study found that beyond the typical courses in DP or data entry, courses in use or in the planning stages range from equipment skills training to insurance or financial product knowledge to interviewing and marketing skills. Current courseware, however, appears to include few options, the study said. Color graphics is most frequently cited (35%), followed by touch-panel input (25%). Future courses may be more interactive video; videotape (25%) followed by both videodisk and color graphics (18% each) were most frequently cited as future options.



Source: RSA Information Designs, Inc.

Of the available courseware, off-the-shelf programs were found to exceed in-house or custom-made products, representing 59% of the current choices and 57% of the planned choices. "Nonusers are overwhelmingly interested in purchasing their courseware," the study said, adding that 74% of the 23 nonuser respondents expressed an interest in purchasing primarily off-the-shelf courseware, but would consider custom-made programs as well.

Conversely, current users are looking either to author their own courses or to contract for custom-made programs.

Once purchased, these programs are most often run on microcomputers in general and IBM hardware in particular — both mainframes and micros. The study found that terminals connected to a mainframe are currently the primary CBT delivery system (51%), followed by micros (38%) and minis (11%). Micros, however, represent 36% of delivery systems under consideration for future use compared to 18% each for mainframes and minis.

Of the mainframe equipment in use today among study respondents for CBT delivery, the choice of the users polled was overwhelmingly IBM (90%). Current micro usage was found to be divided almost equally between IBM and Apple Computer, Inc. (45% each). As for possible future brand choices, IBM is the sole mainframe under consideration and the micro choice of more than half the organizations citing specific hardware (58%).

"IBM, in fact, was cited by a few firms as their possible future choice without specifically stating whether mainframe or micro," the study said, adding that only 17% of the respondents were considering Apple micros.

Not only are CBT users favoring IBM hardware, but there appears to be a trend toward using IBM-compatible authoring systems to develop or implement courseware, the report continued. The most popular mainframe authoring system in use among survey respondents (96%) was IBM's Interactive Instructional System. It and Goal Systems International, Inc.'s Phoenix were the top choices under consideration for future use.

For microcomputers, the most popular authoring system in use is Bell & Howell Co.'s Pass for the Apple (45%), but IBM Personal Computer authoring systems such as McGraw-Hill, Inc.'s Interactive Authoring System (43%) or Computer Systems Research, Inc.-developed Trainer 3000 (29%) are among those under consideration for future use. Pass was not cited at all.

The report costs $185. RSA Information Designs is located at 201 E. 17th St., New York, N.Y. 10003.

For $1750 plug into the IBM 3270 with low-cost printers.

InterLynx™/3287 protocol converter features:

- Fully compatible with IBM 3274/3276 controllers.
- Use low-cost ASCII dot matrix and letter quality printers on 3270 controllers.
- 3270 Type A coax-to-async ASCII conversions.
- LU 3 (BSC) and LU1 (SCS SNA/SDLC) modes.
- Full operator panel (including reprint).
- Front panel menu setup.
- RS-232C and Centronics interface standard.
- Pseudo-transparent data feature.

Comtec meet set for Feb. 20-23

SAN JOSE, Calif. — Comtec, a nonprofit organization that supports the advancement of computer output micrographics (COM) technology, will hold its 14th annual conference Feb. 20-23 at the Westin Miyako Hotel in San Francisco.

A dozen speakers will address subjects related to COM. Arnold Keller of Hitchcock Publishing, the keynote speaker at the conference, will discuss "COM and Information Resource Management."

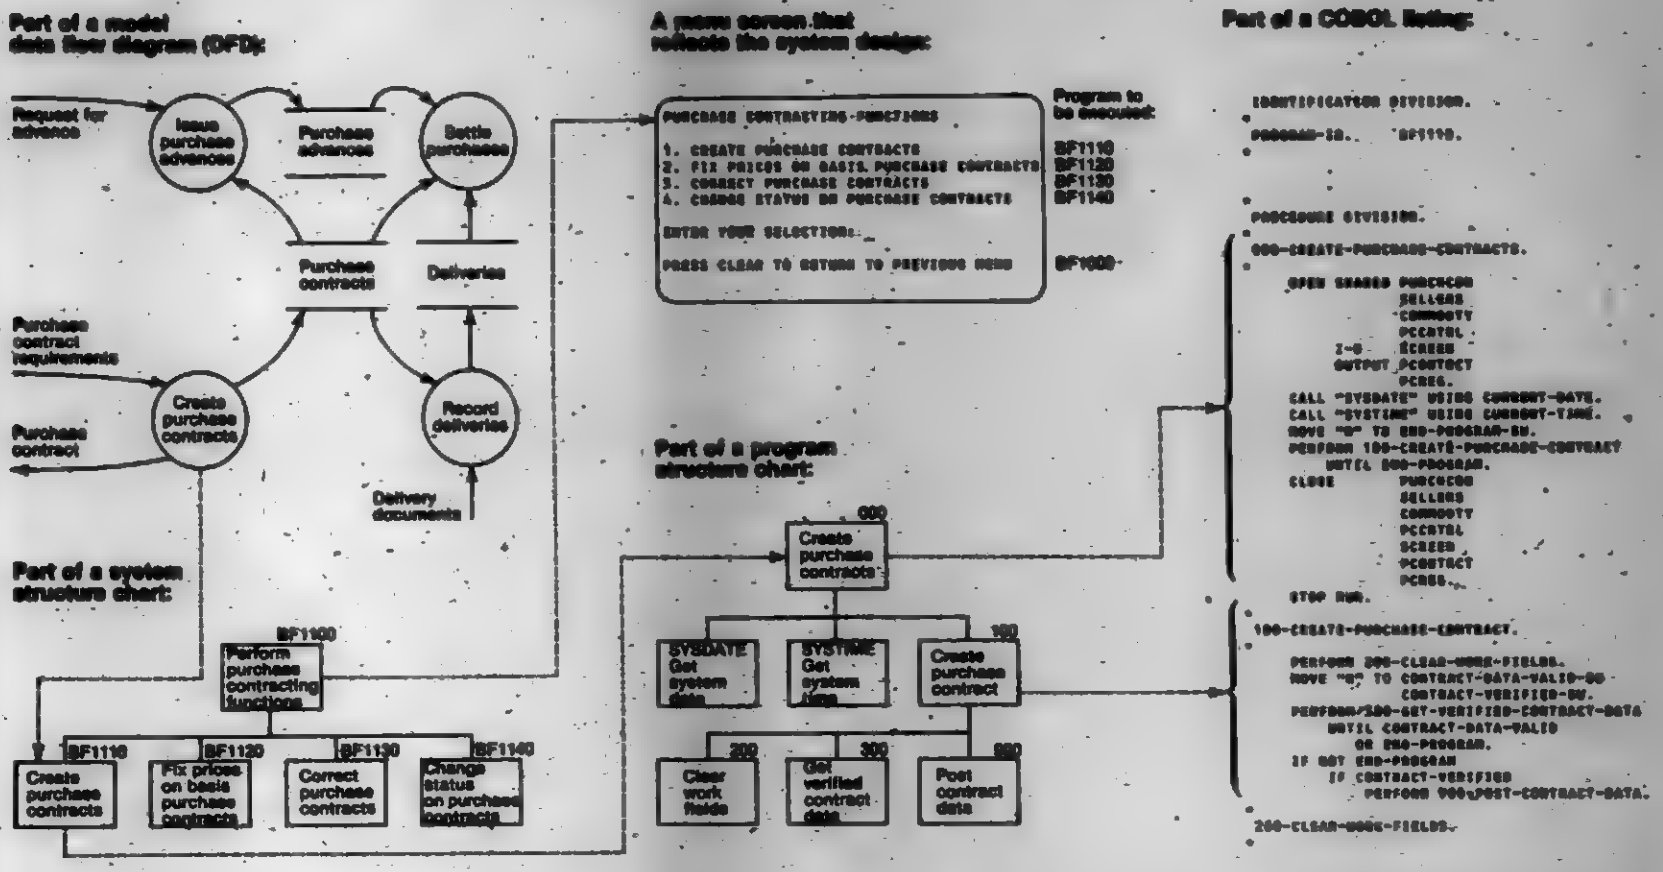
Other speakers include Kevin Fitzgerald of Bell & Howell Co., Karen Voigt of Minolta Corp., Dr. Terry Sonnonstine of 3M Co. and Michael Hughes of Rio Grande Micrographics.

Sessions at which vendors present their products and services will also be featured at the conference, and the seventh Ed Rosse Award will be presented for the most significant contribution to the COM field.

Cost for the three-day conference, including a Japanese Yomise St. Gala dinner on Feb. 22, is $295 before Jan. 20 and $320 after Jan. 20. One-day registration is $140.

Comtec can be reached at Suite 200, 100 N. Winchester Blvd., San Jose, Calif. 95128.

Does your system documentation tie together like this?



In most of the system-development methods I've seen, the system documentation doesn't tie together at all. Instead, it simply points up the shortcomings of the development methods used.

The analysis documents don't lead you into design, and the design documents don't lead you into implementation. They don't help you make the decisions that affect the success of the system the most. They focus on details instead of on critical factors. They're hard to maintain, so they aren't kept up-to-date. They don't tell maintenance programmers whether one program change will affect other parts of the system, too.

At last, a system-development method that offers some solutions

But now, I'm delighted to tell you about a development method that tackles these problems head-on. Find out how to put it to work for you in a NEW book called *How to Design and Develop Business Systems*.

You'll learn how to:

- use an 8-phase development method that takes you easily from analysis to design to implementation
- cut down on paperwork that no one else ever looks at
- create data flow diagrams (DFDs) to analyze an existing system and to model the new system (a DFD shows what data goes into and out of a system and what happens to the data in between)
- use your model DFD to figure out what data elements you need in the new system
- use your model DFD to create a system structure chart that breaks the system down into its logical functions
- use the system structure chart to create menus for interactive systems, to plan programs, and to decide which parts of the system you should do first
- make the right decisions about organizing the database or files so you save hours (or days or months) of re-programming
- get the user to find analysis and design errors early, before the corrections get expensive
- create a program overview that tells what a program must do, but lets the programmer decide how to do it
- design, code, test, and document programs so they're easy to read and maintain...even though they'll need less maintenance
- make your final documentation work as painless as possible

128,000-line interactive COBOL system analyzed, designed, coded, and installed in 12 months

I believe in this method because I've seen it work. And you will, too. The author of the book, Steve Eckols, shows you exactly how he used it to develop a complex system for a grain brokerage.

The system's entirely interactive, nearly self-instructional, and consists of about 128,000 lines of COBOL code. You can see a small part of its documentation above (these are pieces from the book illustrations).

At any rate, Steve did the system by himself, from start to finish, in a year. That averages out to more than 450 lines of tested COBOL code *per day*.

Now I know not everyone will reach Steve's level of productivity. There are just too many factors you can't control.

Still, I'm convinced you should give this method a try. After all, if it's true the average COBOL programmer produces less than 5,000 lines of tested code per *year*, what have you got to lose?

You decide which ideas will work best for you

I guess you can tell I'm sold on this method! Even so, I know it won't be the last word on system development. I also know many people can't...or won't want to...adopt it in its entirety.

So I suggest you treat this book as an idea book. Take the ideas you like (I guarantee you'll like some of them) and plug them into your existing development method. I'm convinced they'll improve the quality of your systems and cut your development time.

FREE trial and 100% guarantee

So you don't have to risk a penny, this book comes with my 100% guarantee. It must give you some development ideas you can put to work in your shop, or send it back for a full refund...*no time limit*. But first, take up to 30 days to review it FREE of charge.

So get a copy TODAY. Find out how to create reliable, maintainable systems in less time than ever before!

Congressman: U.S. shouldn't plan tech development

But should foster high-tech innovations

By Peter Bartelt
CW Staff

PALM SPRINGS, Calif. — The U.S. government should not get involved in planning technological development, but it should make things easier for private enterprise to develop new innovations, according to U.S. Rep. Ed Zschau (R-Calif.).

Speaking here at Infocorp's 1984 Strategic Issues Conference last week before a large group representing a wide segment of the information processing industry, the first-term congressman said heightened government interest in the development of high technology "is a mixed blessing."

While many good ideas have been suggested in Congress, "a lot of bum ideas get suggested, and some of them will pass."

Formerly a professor at the Stanford Graduate School of Business before starting his own company, System Industries, in 1968, Zschau said there is a role for government to play in fostering innovations. But proposals to establish a national planning council to target tax dollars toward identified opportunities are "naive," he said.

Equally misguided, in Zschau's view, are suggestions "to put all the dollars into sunrise industries and forget about all those smokestack industries." While high tech will create millions of jobs, the number "is still relatively small" in comparison to the number of people employed in more traditional industries, he explained.

Don't ignore older industries

Older industries should not be ignored, and efforts should be made to apply the new technologies to make the others more efficient, Zschau suggested. Government should become involved in those new industries, he said, but not by targeting which new technologies should be fostered.

"What we should be doing, in my opinion, is targeting the process by which those innovations are created," he said.

Government's role should be to make sure a climate for innovation exists by implementing four prerequisites that would allow companies to develop new innovations, Zschau said. These prerequisites include:

■ A commitment to broad research, not just in the area of military applications. One method, he said, is to amend antitrust laws to permit corporations to pool "scarce" resources for R&D. "I think by the end of the year we will have changes that permit consortia . . . to enable us to compete in foreign countries with consortia that have long been encouraged."

■ Incentives for industry to take risks on new ideas. Zschau noted that reductions in the federal capital gains tax have dramatically increased the availability of venture capital. He recommended expanding R&D tax credits to cover software and to implement "intellectual property protection" so companies do not fear their investment in new ideas will result in others reaping the profits.

■ The encouragement of an adequate supply of trained technical personnel. "Japan, a country half our size [in population], turns out more engineers a year than we do. Now, we've got the Japanese beat when it comes to lawyers and accountants." Educational institutions need financial assistance to obtain enough faculty and equipment; "the private sector can help . . . but government can give a nudge here, too."

■ The development of market opportunities. The government, Zschau said, must knock down foreign trade barriers and also ensure that U.S. export controls "are designed in a way so we can control, but we can also export."

There must also be a robust domestic market, Zschau said, adding that he thinks the increasing federal deficits must be brought under control to ensure the current recovery does not run out of steam. He said the issues of raising taxes and cutting spending must be depoliticized.

Zschau concluded that it is not the government's responsibility to maintain technological leadership in world markets. "It is your responsibility," he told the audience of industry representatives.

BOWL from page 1

However, Washington gives up too many yards per pass attempt, a critical weakness in the forecaster's estimation.

"The Raiders are strong against both the running and passing games," he pointed out. Los Angeles gives up 5.4 yards per pass attempt as opposed to 6.3 for the Redskins. In Goodean statistics, that one-yard differential translates into a three-point edge for Los Angeles.

It all sounds very concise, but as Goode is quick to observe, "There's no way you can beat the line."

Howard, a betting man, is editor of Computerworld on Communications.

4th Generation Language for the Personal Computer

NPL® The NonProgrammers NonProcedural Language

The NPL Information Management System lets an end user build applications without becoming a programmer.

In less than one day, you will:
- create database files of your own
- specify edit and validation tests
- 'paint' data entry screens
- select, sort and merge data records, and
- print simple and formatted reports

NPL is available on the following microcomputers: IBM-PC® & IBM-XT®, Apple® II & III, DEC Professional® 350 & Rainbow® and the Sage II ...soon on Victor® 9000, Burroughs B20, Hewlett Packard 9816.

If you like RAMIS II®, FOCUS® or NOMAD2® on big mainframe computers, you'll love NPL on a microcomputer... the strong language similarity means zero training time.
The NPL System is an essential tool for your company's INFORMATION CENTER.

All for only $950!

IBM multiuser micro forecast — without Unix

By Peter Bartells
CW Staff

PALM SPRINGS, Calif. — IBM will probably bring out a multiuser microcomputer system sometime early this year, but it won't use the Unix operating system.

That was the prediction delivered here last week to a large group of industry representatives attending Infocorp's 1984 Strategic Issues Conference.

Infocorp President Richard J. Matlack predicted IBM will announce a multiuser system sometime during the beginning or middle of the year. "IBM is going to bring out an [Intel Corp.] 8086 multiuser system," he forecast. "It will be a proprietary operating system, a superset of [Microsoft, Inc.'s] MS-DOS."

Unix is a great operating system for some uses, but not for commercial data processing, Matlack said. But it is notable that Unix was developed by AT&T, which could be IBM's biggest competitor if it comes out with an expansive line of computer products, as many expect.

IBM may announce the anticipated multiuser micro earlier than the company would like in order to meet those competitive pressures, according to Ralph A. Gilman, senior vice-president of Infocorp and head of the company's Microsystem Analysis Group. "If I were IBM, I'd probably want to wait another year; but competitively, their hand might be forced," Gilman said.

Companies that have entered the multiuser battle scene experienced a disappointing year in 1983, according to Infocorp. "Clearly there is no leader in this market," Gilman said. "It's ripe for a leader to step in — IBM, AT&T."

According to Infocorp, a lot of potential multiuser system buyers settled for microcomputers that could be linked together.

There is a lack of software standards and a lot of confusion among buyers, according to Gilman. "The market really hasn't given us an indication where they are going to turn. Maybe IBM will."

Functionality needed

The criteria for spurring the market, in Gilman's view, is "a data base/file server functionality." Users "want to attach dumb terminals to the system, but also to attach personal computers in a network."

The problem has been that "nobody really wants to take the lead in developing software to make this happen. Nobody wants to spend the money," Gilman said. "It might be an opportunity for some of the mini vendors who have the software to step in."

A number of strategic problems face micro vendors, Gilman said.

One is the entry fee for bringing a new product into the market. The cost of doing that will again escalate this year, he said, costing from $50 million to $100 million. Driving those costs are running hot lines to answer users' questions, waging "warranty wars" to bolster confidence in products, operating product centers, providing training and service and purchasing national advertising that can run $20 million and up.

Another factor is the lack of shelf space. Computer stores presently have about 8,000 shelf slots to exhibit micros, but only 2,000 of those spaces are available to new products.

"A lot of people are taking a second look at direct sales, particularly for multiuser systems," Gilman said.

There is a similar lack of access to big business decision makers, he added. "The big market, the Fortune 1,000 corporate manager, more and more is going to the internal information center and trying things out. It's a nonthreatening type of environment — they're not looking over his shoulder."

Hotel fire prompts regulations

BOSTON — Four days after an electrical fire shut down both the regular and emergency power systems at the Westin Hotel here, a state panel passed regulations requiring isolated, fire-resistant emergency electrical and communications systems in new high-rise buildings.

The Mass. Board of Fire Prevention passed the emergency regulation, which could become permanent after a Feb. 3 public hearing. A Boston electrical inspector suggested the rule after the Jan. 2 fire disrupted the 37-story Westin's emergency power and communications network. That outage left most of the hotel unlit and without a public address system as 120 guests and several hundred employees fled through smoke; 66 people were injured.

Although the Westin fire knocked out most power, the data processing department, equipped with a dedicated emergency power supply, lost electricity for just minutes [CW, Jan. 9].

The new regulation requires new buildings over 70 feet tall to isolate emergency cables from the primary cables by placing the emergency system in a separate shaft. That shaft and the cable coverings must be able to withstand fire for four hours.

Heavy duty.

If you can't afford printer downtime, pick the ones designed to take all the punishment you can dish out and still keep printing. Our 35 and 55 character-per-second daisywheels print sheaves of crisp, sharp letters at doubletime, with never a moan or groan. Call your distributor. Or contact Dataproducts at (213) 887-3924. 6200 Canoga Avenue, Woodland Hills, CA 91365. In Europe, 136-138 High Street, Egham, Surrey, TW20 9HL, England.

Atari founder heralds the unorthodox for innovation

By Peter Bartelik
CW Staff

PALM SPRINGS, Calif. — "If you really want your people to innovate, buy a science fiction book, take the cover off and tell them it's history," Atari, Inc. founder Nolan K. Bushnell declared here last week during a conference for information industry representatives.

Delivering the keynote address at Infocorp's 1984 Strategic Issues Conference, Bushnell praised the unorthodox and sparked much laughter from an audience of more than 200 people representing vendors, various entities in the product distribution chain, representatives of large end-user organizations and others.

Claiming, partly tongue in cheek, that innovation is another word for concealing sources, Bushnell said, "The future is not totally dependent on innovation. Most of the ideas are out there. Just read science fiction; most of the things they write about are going to come true."

Now chairman of Catalyst Technologies, a venture group that has "figured out a way to mass-produce small companies," Bushnell praised the potential for innovation among individuals and urged the participants to foster individual experimentation.

"To throw wagonloads [of people] at projects is the most oft-repeated mistake of American big business," he charged. Also, he said, "It's not axiomatic that a person who can see the future is necessarily articulate enough to explain his vision to you."

Bushnell developed the Chuck E. Cheese's Pizza Time Theatre concept, which features robotized animal characters and which, he said, may develop into robotic delivery of pizzas by the end of the year. He expressed his feelings on robotics to illuminate his views on innovations.

Robots will 'do windows'

Many believe robots will eventually be a standard feature in homes, "yet, the amount of cynicism and skepticism is overwhelming." He continued, "Then the questions is, what will [robots] do? They do windows."

Bushnell noted that Americans in 1982 spent $8.2 billion on pet food alone and that there is potential for robotics to capture at least some of those dollars. "Fido . . . [is] basically an entertainment device. . . . It's easy to have them detect smoke and fire and take appropriate action."

The point, he said, is that technological innovators "must be willing to enter a novelty. There's nothing immoral, fattening or bad for you [in that]; not everything has to have utility."

In the microcomputer area presently, he declared, there is little that is innovative and much that is merely further development, such as the Personal Computer-compatibles of the "commodity" that is the IBM Personal Computer. "Real innovation comes when you take marketplaces that have not previously existed and do something. Having a product that didn't exist means people aren't used to it, which means you might not have [an identifiable] use for it."

The information revolution has created the need for development of high-tech innovations in the leisure industry, as machines take over the roles of people, he said. He suggested that innovators should look to those areas: "Being willing to go after fun can be a really nice way of finding places to enter."

In addition to encouraging businesses to allow very small groups — one to three people — to work on projects, Bushnell also said he believes in setting time constraints and setting goals. "My theory is that 25% of the technological [gross national product] of the U.S. is created 24 hours before a trade show," he said. "The U.S. has more innovations than the Soviet bloc because of trade shows."

In a more serious vein, he declared that "the business of innovation is one of a philosophy of belief in the individual."

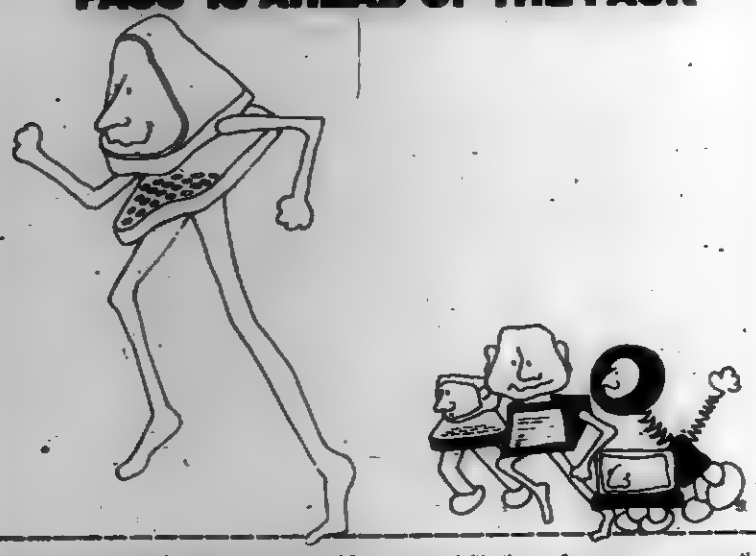
Report details mini purchases

CHERRY HILL, N.J. — Management Information Corp. (MIC) has published "How Small Businesses Use Computers," a report that describes minicomputer purchasing processes completed by 26 companies in various businesses, such as a nursing home, a furniture manufacturer and a trucking company.

MIC interviewed company officials responsible for recent minicomputer purchases. The report includes systems selected, purchasing criteria, financial considerations and system implementation, the publisher said.

The 87-page report is priced at $11. More information is available from MIC, 140 Barclay Center, Cherry Hill, N.J. 08034.

FOR VAX™ RESOURCE ACCOUNTING, PACS™ IS AHEAD OF THE PACK



The competition isn't even close. PACS is so good, it's the only resource accounting package in DEC's™ EAS library. Here's why:

There's life after IBM: market researcher

By Peter Bartelik
CW Staff

PALM SPRINGS, Calif. — Not only is there life under IBM for other computer vendors, there may even be life after IBM, according to a market research firm that hosted a conference here last week for industry representatives.

Richard J. Matlack, president of Infocorp and host of the company's 1984 Strategic Issues Conference, looked far beyond the five-year analyses promised to representatives of many industry segments. He warned participants that rapid innovations in the information processing industry would eliminate their present functions and inspire vast structural dislocations before the end of the century.

"I think companies like IBM that have been around for a long time will either voluntarily or involuntarily break themselves up into new relationships," Matlack predicted.

As the industry progresses from information processing to knowledge information processing, "the old rules" of doing business will no longer apply: "If machines can design hardware better than hardware designers, why do we need hardware designers? If machines can program better than programmers, why do we need programmers?"

While admittedly "crystal-balling," Matlack repeatedly said he believes the next stage of computer technology has already arrived. The industry has already started the shift from Mips — millions of instructions per second — to Lips — logical inferences per second, he said.

Companies like Digital Equipment Corp. and General Electric Co. have designed expert systems that "do better jobs than the individuals training them to do those jobs," he added.

Matlack warned industry players to look ahead and look beyond the obvious. "We're kind of like dinosaurs tiptoeing around the tarpits. I'm afraid we're going to fall in." The reason for that fear is that the present state of technology has made available "too much information, but not much knowledge."

The delivery of knowledge to end users will be what drives the industry through the next 25 years, Matlack claimed. But the cost of bringing new products into the market has in the past year or two already become much more expensive, he said during a review of Infocorp's current five-year projections.

"Today, to get into the micro business, it takes $30 million to $50 million," Matlack said.

Microcomputers are where the action is now and in the next few years, according to Infocorp's projections. "By 1988, this new industry, which is only seven years old, will actually generate the majority [dollar-value share] of systems shipped," according to Matlack.

While IBM presently dominates, other big players such as ITT and AT&T will carve up the market so that no one company can overwhelmingly dominate, Matlack said.

Opportunities presently exist for companies that can bring practical uses to the consumer computer market, he added.

According to Infocorp Vice-President Ralp A. Gilman, "By 1988, over two-thirds of [microcomputer] units sold will be priced under $1,000." In dollar terms, he added, by 1988, micros in the $1,000 to $6,000 price range will represent half of all micro shipments.

Large computer systems, priced over $350,000, won't disappear, according to Matlack, and in fact should experience rapid technological development. "Eventually, large systems are going to link all your micro systems," he said.

"They are not going to go away, they just won't be as dominant as they once were," he added.

Small systems, priced from $25,000 to $350,000, have seen the market slow considerably, but there are still opportunities for innovative companies such as those presently selling fault-tolerance, computer-aided design and manufacturing and transaction processing, Matlack said.

Common conference set for April

CINCINNATI — Common, the organization of users of IBM equipment ranging from the Personal Computer to the 4300 series processors, plans to hold its spring '84 conference at the Convention and Exposition Center here April 1-5.

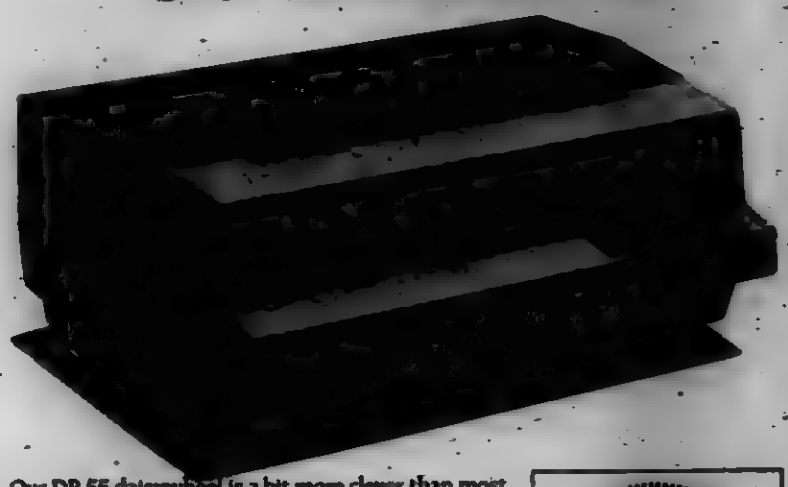
The conference will feature 200 seminars covering such topics as management, hardware and applications.

Among the scheduled seminars are "Performance Appraisal," "Dealing with Problem Employees," "Office Politics," "Job Stress and Burnout" and "How to Introduce New Technology Into Your Firm."

The conference costs $100 for members who prepay, $130 for members who register the first day of the conference, $160 to nonmembers who pay before the conference and $180 for nonmembers registering on the first day.

Information can be obtained through Administrative Director, Common, Suite 1717, 435 N. Michigan Ave., Chicago, Ill. 60611.

Brighter writer.



Our DP-55 daisywheel is a bit more clever than most. A digital status display tells you what it's doing as it prints, and how you can help when it doesn't. It can save you time and money, and that's just plain smart. Call your printer distributor. Or contact Dataproducts at (213) 887-3924, 6200 Canoga Avenue, Woodland Hills, CA 91365. Ada's year of reckoning

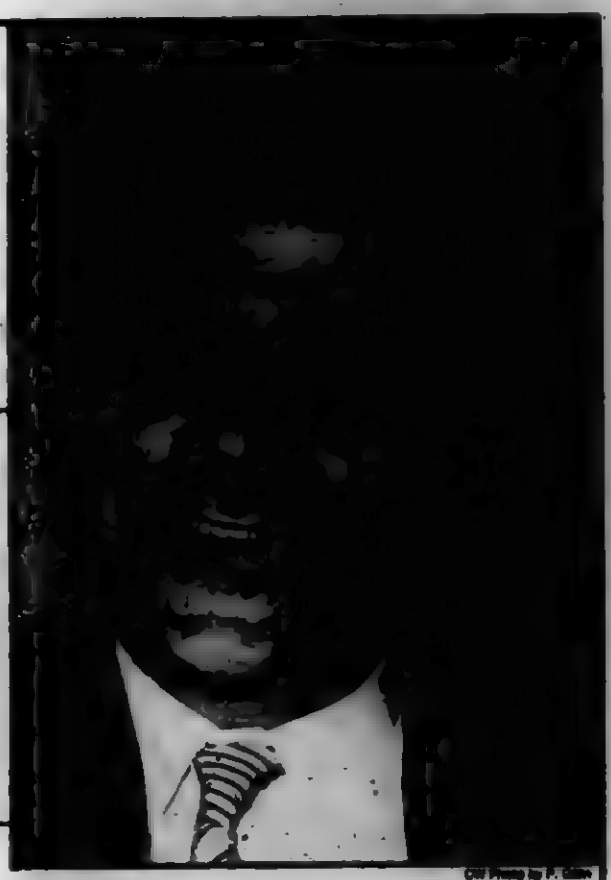
Insights offered by its chief designer

Nineteen eighty-four should be the year of reckoning for the Ada programming language. The U.S. Department of Defense (DOD), which commissioned Ada in 1974 in an effort to standardize its development work, has directed that all major DOD projects begun after January 1, 1984, must be programmed in Ada.

The language has been the subject of much scrutiny and debate in the data processing community, which may eventually have to deal with the issue of scrapping millions of programs to conform to a government-imposed language standard. Ada detractors say the language is complex, difficult to learn and largely untested. Supporters say Ada's portability and technical elegance will more than make up for the inconvenience of converting existing software.

Jean Ichbiah, president of Alsys, S.A. of France and chairman of the board of Alsys, Inc. in the U.S., was the chief designer of Ada while at CII-Honeywell Bull in France. His new company markets Ada compilers in Europe and is preparing to enter the U.S. market with microprocessor-based Ada compilers later this year. Ichbiah was recently interviewed at Alsys's offices in Waltham, Mass., by Computerworld Senior Editor/Software Paul Gillin.



Ichbiah

CII Photo by P. Glinn

According to the Department of Defense (DOD), all mission-critical applications should now be developed in Ada. Is that actually the case?

We have no reason to believe the contrary. The important thing is that DOD is actually starting to design in Ada. They don't need a compiler to start with, but they need to be sure that they will rendezvous at the correct time with an operating compiler.

They have at least one year available to them before they need an Ada compiler actually operating on these machines, a year and a half before they need a good compiler and probably two years until they need an excellent compiler.

How there been the level of interest in Ada from the business community that you had expected to see?

I strongly believe that when we come up with the compilers, the language is so much better than anything else that the use of it will spread very fast. So it's no surprise to me at this stage that [the business community is] not crying out for compilers. Once they have them, they will use them.

The approach DOD is taking to promoting the language is beyond my wildest dreams. If you want a point of reference, in 1971 on PL/I, you had about three books available and that was for a language defined in 1964, with the first compiler available in 1968. On Ada you already have 50 to 60 books. It's a milieu of culture that's developing, in which a consensus creates a consensus and so on.

How do you respond to the argument that instead of Ada, we should standardize something we already know, like Cobol?

Languages like Cobol and Fortran are not bad languages, but they were good languages designed for a time when the cost of hardware was exceedingly high. We've come to a different time in which we know that we can ascribe many more tasks to the computer. For example, an Ada compiler is going to do a lot more checking than a Fortran compiler or a Cobol compiler.

We've also come to a culture where we're asking a lot more from computers. We are giving them tasks for which reliability is essential, and, therefore, we give much more value to program reliability. This is not something that we could achieve with previous language technology.

What impact do you think the Ada initiative will have on other DOD language development plans? Is it intended to be a complete language for DOD projects in the foreseeable future, or do you think it will be an evolutionary language?

I think within DOD they will use Ada and try to do other things with packages merged into Ada, rather than through new languages. Ada has a very powerful concept we call a "package."

In the past, if you wanted to do work on matrices, there was no other way than having a special feature called "matrix" in your language. With Ada, if you want to define matrices, you don't have to change the language. You just define a package that you call "matrices," in which you define what is a matrix and what are the operations you want to do.

The beauty of these mechanisms is that they don't require any changes to the compiler.

How important to Ada's success is the issue of portability?

One important thing DOD has done that has given a lot of credibility to the Ada effort is ensure that Ada means the same things to all people using it. In the past, a language was defined, compilers were developed and several years later they started standardizing it, and then years later they thought about a validation facility. That was like shooting first, aiming after and thinking finally.

With Ada they've done the things in the right order. There was the language definition, then they developed the standard for the language, then they developed a validation facility and then finally compilers. It's the first time compilers have appeared that could be validated against a standard.

Another important thing is that they have to revalidate every year to be called Ada. You can't sell an Ada compiler unless it's validated.

How do you avoid a "Tower of Babel" effect created by many vendors implementing their own versions of the language?

Several companies, including our own, are using an approach that will simplify the portability of Ada compilers. We're restructuring our compiler in such a way that we can distinguish two main logical parts.

The part that we call the root is machine independent and represents about 80% of the work that needs to be done. Now, this part translates into an intermediate language. This is taken over by a code generator, and the code generator translates it to object code. It really means that when we are attaching another machine, we only need to do the 20% part that is machine-specific again. We don't need to do the root.

The primary criticisms that are leveled at Ada are that it's too complex and that it contains too many elegant features which are useful only in a limited sense. How do you respond to that criticism?

First of all, you can teach Ada by stages. For instance, if you don't need the real-time feature, you don't have to learn it. The second response is that this kind of complexity is very subjective. The experience we've had is that once people learn Ada, they find it extremely easy to use.

Suppose someone provides you a very small language, which is simple and solves a part of a problem, but leaves you needing other tools to solve the rest of the problem. Have they made your problem simpler? No.

Ada has taken a realistic attitude that our aim is to solve problems, not only one facet of the problem, and if we judge complexity, we should judge the complexity of the complete resolution of the problem.

A third line of response is that much of this complexity accusation has come from a certain part of the academic community. Their claim was based on the document that defined the language. Now let me use an analogy. If you had a theater and you saw the design documents for the theater, they show all the wiring, all the concrete and such. If these documents are not complex, the theater is not going to do its job.

I think the comparison applies well to Ada. We can teach it to professionals in a matter of days. Thereafter, if they use their intuition, they find the correct answers, very much as you don't need to remember the plans of the theater in order to find your seat.

What will it take in the end to convince the skeptics that Ada is here for the long term?

When our compilers are available on the [Intel Corp.] 8086 and the [Motorola, Inc.] 68000 [microprocessors], then people will be pressed to make a choice. If they have to do the applications, I don't see why they would do it in Pascal or C rather than in Ada.

The reason we're not expending any effort trying to convince skeptics is that they have the right to be skeptics until they get a compiler in hand. When they have a compiler that runs, the situation will be quite different.

NEWS

French user gives ADE credit for new business

1ST USER

By Susan Blakeney
CW Staff

ORLY, France — The first commercial European user of the Data General Corp./Bolsa Corp. Ada Development Environment (ADE) says it has won a string of new accounts since it implemented the system last fall.

ADE is comprised of Bolsa's Ada software and DG's family of Eclipse superminis. The multiuser Ada Work Center systems are intended for developing, testing and debugging Ada applications (CW, May 9).

ADE's first European user is Informatique Internationale, which specializes in applications development for aerospace projects, nuclear energy and oil exploration. Informatique Internationale is a subsidiary of the major French software and systems house Groupe Cisi.

Informatique Internationale's president, Guy Canevet, said ADE has been critical to getting new business in the space and research industries, including contracts with the French Space Agency, the European Space Research and Technology Center, Aerospace and Electronic Serge Dassault and the French Institute of Statistics. "These accounts would not have been possible without the new product," Canevet maintained. "For example, the computer center at the National Scientific Research Center at the University of Montpellier [in Montpellier, France] can connect terminals directly to our computer to run Ada development programs. We have contracts from other customers who simply want experience with Ada."

The DG/Bolsa Ada compiler was the first commercial compiler to be validated by the U.S. Department of Defense's (DOD) Ada Joint Project Office in June 1983. Ada, the standard programming language trademarked by DOD, is expected to become the single most common computer language for all branches of the American military by 1986.

The general response to ADE at Informatique Internationale has been very positive, according to Canevet. "We have been able to make tools for developing other software with it . . . We have created a version of a testing language [Atlas] that allows hardware testing. We're quite pleased and hope our success will continue."

Similar in structure to Pascal, Ada is considered particularly well suited for real-time applications requiring concurrent processing. As demonstrated by Informatique Internationale, the characteristics of Ada are also beneficial in commercial, industrial and scientific applications.

Canevet first heard of the ADE product at a seminar early in 1983 and contacted Bolsa shortly thereafter. Until then, Informatique Internationale had used a system it had developed itself. "It was a top-down methodology using a series of graphs. But then for a more detailed analysis, we had to use something else . . . We had developed an extended version of Fortran with real-time capabilities," Canevet recalled. "The whole process took too much time . . . We needed more sophisticated software engineering tools."

The decision to go with ADE was made in June. Even though comparative shopping was not possible, Canevet said the combination of Ada with a high-quality development environment was very attractive.

"We would have liked to make an industrial comparison of products, but there were no other ones available," he lamented. "And as far as I know, it's still the only one out there."

Informatique Internationale sent two staff members to Bolsa's Santa Clara, Calif., training center for a week. Upon their return, they trained the rest of the company's applications development team. The software was installed in September at company headquarters here on an eight-user DG Eclipse MV/4000 system configured with DG Dasher terminals.

When asked if the new application development environment has visibly hiked productivity, Canevet said it is too early to tell. "We are now developing one part of a new ground station for a satellite using ADE. We're still experimenting with it."

As proof of its satisfaction, Canevet said, the company is upgrading its DG MV/4000 minicomputer to the DG MV/10000 supermindcomputer in March. "We need more power because of all the new business that's developing," he explained.

Report eyes computer tax breaks

PRAIRIE VILLAGE, Kan. — A report explaining how computer purchasers can take advantage of tax breaks has been compiled by a certified public accountant here.

"Tax Breaks for Computer Buyers," by Vernon Jacobs, is said to outline the benefits of deducting computer purchases on tax returns and of investment tax credits that are available.

The 26-page report is available for $9, according to the publisher. It can be obtained from Research Press through Box 8137-P, Prairie Village, Kan. 66208.

The *USS New Jersey* joined American ships last month in the shelling of Syrian positions east of Beirut.

Battleship happy to stay analog

Gunfire system predates digital computers

By Peter Bartelik
CW Staff

This may be the era of *Star Wars* computerized warfare, but when the recommissioned battleship *USS New Jersey* fired its massive 16-in. guns during naval bombardment operations off the coast of Lebanon last month, the devastating shells were directed by electromechanical systems that predate the first stored-memory computers.

According to a spokesman for the U.S. Navy, the gunfire support system aboard the *New Jersey* — the only active battleship and the largest active warship in service throughout the world — is a World War II-era analog system.

Although the *New Jersey* was twice taken out of mothballs for service "on the line" during the Korean and Vietnamese conflicts, and again recommissioned just over one year ago, the gunfire support system remains the same as installed for the original commissioning in May 1943, according to Lt. Dennis Sawyer of the Navy's information office.

The battleship was recommissioned by President Reagan on Dec. 28, 1982. During the legislative battle to fund the $326 million renovation project, supporters termed the vessel invincible because of armor protection up to 16 inches thick and its massive firepower. Critics termed it a dinosaur and said its 1,500 enlisted men and 60 officers would be sitting ducks in today's high-technology warfare.

Shells create craters

The shells fired in December against positions reportedly held by Druse Muslim fighters each carried 1,900 pounds of explosives that reportedly can create craters 50 yards across and 20 feet deep.

The *New Jersey* is one of four "Iowa-class" battleships built for World War II service. The *USS Iowa* is itself currently undergoing refurbishing and is scheduled for recommissioning on April 30, after which it will relieve the *New Jersey* in the Mediterranean.

According to John Reilly, a civilian historian with the Naval Historical Center in Washington, D.C., the components of the *New Jersey*'s gunfire control system are still state of the art, even though they were developed prior to World War II. "No new system has been developed for heavy weapons," he said. "There has been no occasion to develop a new system. What they have on board works."

With the Iowa-class ships out of service as much as in service over the past four decades, he surmised, there has been no pressing need to spend millions to develop a modern computer system.

At the heart of the system controlling the nine 16-in. guns is a Mark 8 range keeper, an electromechanical device that receives input from various sensors on target range and direction, along with the *New Jersey*'s own motion, direction, speed and even wind speed.

Keeps guns on target

The range keeper keeps the guns pointed on target during movement by both the ship and target. The system was adapted from the Mark 34 system in use during the 1930s, Reilly said.

Another range-finder system, the Mark 1, directs the *New Jersey*'s battery of 12 five-in. guns, which were also fired last month. The Mark 1, also developed during World War II, was the first system termed a computer by the Navy, according to Reilly.

There has been some modernization, Lt. Sawyer noted. In the latest recommissioning, 20 eight-in. guns were removed to make way for cruise missiles. The long-range Tomahawk is designed for antishipping attacks of 200-plus miles and land attacks in excess of 1,350 miles and is controlled by General Dynamics Corp.'s Tomahawk Control System and onboard Terrain Contour Matching microprocessors.

The short-range harpoon is designed for ship-to-ship operations up to 60 miles and is controlled by the AN/SWG-1 control system built by McDonnell-Douglas Corp. and Sperry Corp.

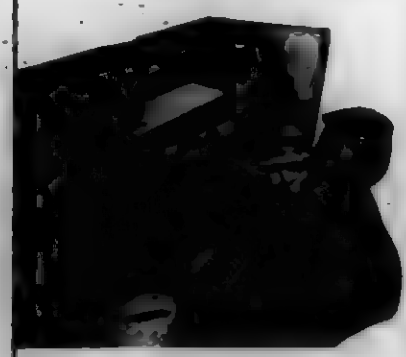
UNIX & C
HANDS-ON TRAINING
AND NOW INTERACTIVE VIDEO

Select your training medium according to the type of training you prefer and the number of people to be trained.

VIDEO-BASED TRAINING. The Computer Technology Group's Video-Based Training integrates professionally developed and produced video and text material, as well as hands-on exercises, into complete training programs.

Our courses are produced with the highest standards of video quality, applying the latest techniques of instructional design including the use of computer graphics and animation techniques to compress learning time. The students' time is not wasted with the "camera at the back of the classroom" or "chalk talk" approach which is so inefficient, and often ineffective, in transferring skills.

Our Video-Based Training courses are completely self-contained, including the hardware-independent hands-on exercises. All you need is a video cassette player.



COURSE	Number of Modules: Video-Based	Interactive
Computers at Work	15	
UNIX—An Executive Perspective	1	
UNIX Overview	6	6
UNIX Fundamentals	15	15
'C' Language Programming	16	16

INTERACTIVE VIDEODISC TRAINING. Our new UNIX Videodisc Training Curriculum combines the benefits of our Video-Based Training with the flexibility of microcomputer access. Designed as a one-on-one tutor, our interactive system assesses the training needs of each student and dynamically tailors the training to his/her specific needs, thus eliminating redundant training. Through engaging exercises and interactive video, we are able to increase student comprehension while reducing training time.

Developed by the Computer Technology Group and Interactive Training Systems, the curriculum uses the latest laser videodisc technology—including IBM PC, color monitor and Interactive Training System Controller.

PUBLIC AND IN-HOUSE SEMINARS. Both public and in-house seminars are offered on a wide variety of UNIX and 'C' Language subjects, including:

UNIX Overview • UNIX Fundamentals for Non-Programmers • UNIX Fundamentals for Programmers • Shell as a Command Language • 'C' Language Programming • Shell Programming • Using Advanced UNIX Commands • UNIX Internals • UNIX Administration • Advanced 'C' Programming Workshop • Advanced 'C' Programming Under UNIX • Berkeley UNIX Fundamentals and "csh" Shell.

Custom software sales tax meets its match

Specter of personal ruin fuels one-man crusade

By Bill Laberis
CW Staff

MIAMI — When state revenue agents in 1976 told Bob Sherin that he owed $45,000 in unpaid sales taxes, about the only thing he was certain of was that he could not afford to pay.

What he did not know was that the revenuers' visit would nearly ruin his computer service business, strain his marriage to the breaking point and launch him on a crusade that today has made him a driving force behind abolishing state sales taxes on custom software.

Sherin

Sherin's cause has taken him to courtrooms, administrative chambers and statehouse rostrums across the country. There his single-minded dedication, fueled by a trauma that he said almost blotted out his professional and personal life, has been a key factor in several successful attempts to exempt custom software from state sales tax provisions.

"It's almost a religion with him; he'll go anywhere and do just about anything to press his fight," said one software industry executive familiar with Sherin's antitax campaign of the past seven years. "A lot of people disagree with the position he has taken over the years, myself included, but you'd have to say on the other hand that a lot of people are indebted to him, too."

Sherin has been retained as a special witness and nonjudicial adviser in sales tax cases by professional organizations such as the Data Processing Managers Association and the Association of Data Processing Service Organizations, Inc. He has at times bucked the legal establishment in advocating that sales tax rules be fought not in court but at administrative hearings, where the tax code itself is contested, not simply its application in individual cases.

If taking on the government hasn't been enough, Sherin has also butted heads with Data General Corp. In 1973, DG demanded that Sherin cease using the term Nova in his company name, then Nova Computing Services, Inc., because DG had labeled its minicomputer line with the same name. But Sherin fought back, claiming his use of the word predated DG's, and threatened to take DG to court to prove his point. DG backed off, paying Sherin for exclusive rights to the Nova trademark.

> *"Sherin's cause has taken him to courtrooms, administrative chambers and statehouse rostrums . . . his single-minded dedication . . . has been a key factor in several successful attempts to exempt custom software from state sales tax provisions."*

But it is his obsession with obliterating software sales taxes that has dominated Sherin's life since 1976. "My struggle has given me a sense of personal fulfillment, which is what I needed to compensate myself for what I had needlessly suffered," Sherin said in a recent interview. "It's the most important thing in my life."

Sherin's odyssey began in early 1976 shortly after Florida revenue officials examined the books of Nova Computing and presented him with a bill for $45,000 in back taxes, interest and penalties. The state's actions seemed entirely proper, given a segment of the state tax code that extended the sales tax to punched data processing cards and coded magnetic tapes, labeling them "tangible . . . and, therefore, taxable property."

Word of Sherin's assessment spread. A local bank demanded back half a $50,000 loan made to Sherin for hardware he'd purchased. To make good on the demand note, Sherin chewed into his business' operating capital and even refinanced his home. The strains on his business and credit rating began to creep into his marriage. Eventually his wife left him.

Determined to fight the law, Sherin found little hope in the legal community, where lawyers informed him that the law was clear. So he turned what remained of his business over to associates and immersed himself in law books for the next year, spending each day in a local law library poring over case studies relating to taxation. At one point he studied at night by candlelight when, because he was unable to pay his bills, his electricity was shut off.

He persuaded both the *Miami Herald* and the Florida Light and Power Co. to pay for some legal research into the matter and raised further funding with appeals to his customers for aid. But Sherin was to argue the case himself, and his day in court arrived in November 1976.

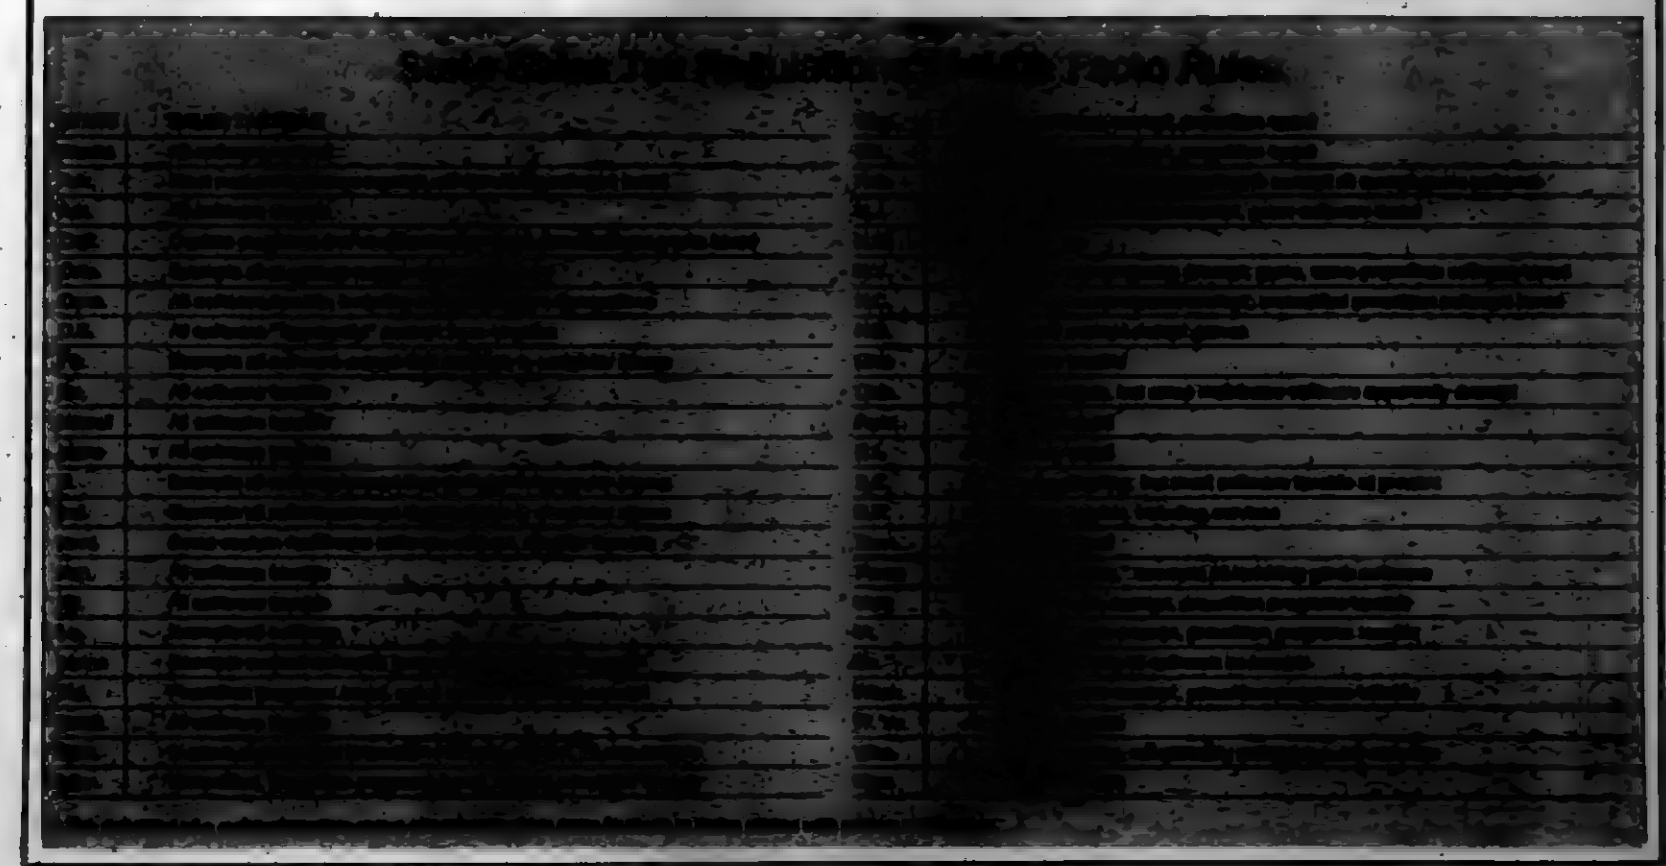
Sherin's attack went to the heart of the tax code, questioning the propriety of labeling a programmer's work as tangible while calling that of an accountant or lawyer intangible. The climax of the case came when he subpoenaed the state's director of systems and programming and, over the objections of state attorneys, got the director to state his opinion that software is a personal, and therefore intangible, service.

Sherin prevailed; the administrative examiner who heard the case issued a directive that the tax rule applying to software was invalid. The state did not appeal.

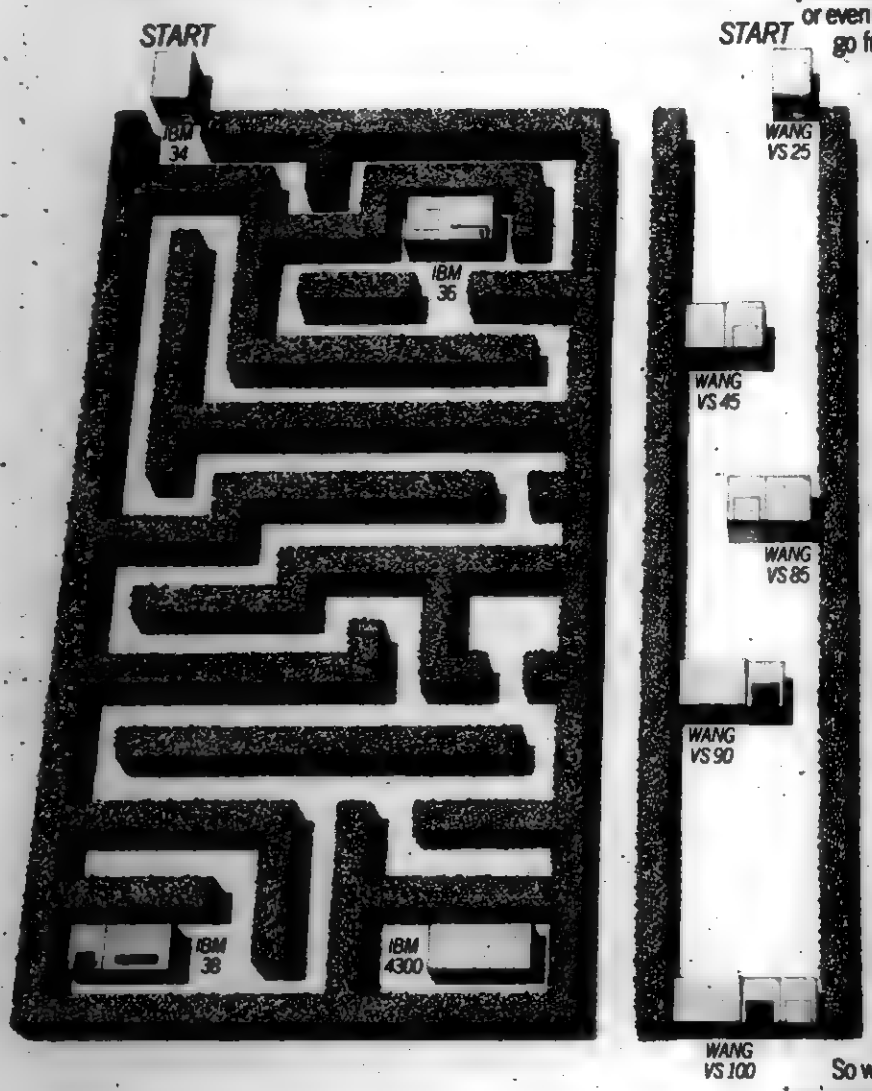
His victory drew the attention and praise of industry groups, who began drawing upon his expertise to join the sales tax fight in several states, including Rhode Island, Ohio, Massachusetts, Michigan and Wisconsin. He also began writing voluminously on the subject for industry association journals and trade publications.

Today, Sherin said he is continuing his antitax crusade, having an admittedly easier time building upon his past accomplishments than going it alone. He was involved in the recently concluded action in Michigan, where the high court upheld a ruling against the state tax department, differentiating between custom and canned software in the application of sales taxes [CW, Sept. 26].

"It's fun for me now. . . . I found you really can become quite an expert on a narrow issue," Sherin said. "I feel I've been fighting for basic rights, improper taxation and the like. It's an honor to have been involved."



Compared to IBM, Wang has the growth path of least resistance.



If you're currently considering an IBM 34 or even a 36, consider this: where do you go from there?

To an IBM 38? Sure, if you want to spend up to 18 months converting to a different operating system, different source codes, and different software.

To an IBM 4300? The same problem again. Only magnified. Because if the IBM 34 and 36 have little in common with the IBM 38, the IBM 38 has nothing in common with the IBM 4300 (logo excepted).

Now consider the Wang VS line.

One operating system that supports the same software, utilities, and documentation. A line that's compatible from top to bottom and bottom to top. A line that's compatible with other Wang equipment as well as most mainframes, including IBM. And a line that can tie you into total office automation faster and easier than any other systems available anywhere.

But even if you only need a single computer, a Wang VS is a better choice. Because every VS offers data processing, voice, graphics, electronic mail and extensive networking. And only a Wang VS offers Word Processing Plus, feature for feature the most comprehensive word processing software in the world.

So whether you plan to buy just one business computer or a whole lot, the Wang VS line is simply the best way to go. And the only way to grow.

Compare it to IBM; it's easy to see why Wang offers the growth path of least resistance.

For a demonstration of Wang VS computers, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

Experts say Apple-Franklin issue undecided

Operating system copyrightability still 'on the table'

By David Myers
CW New York Bureau

NEW YORK — Franklin Computer Corp. abandoned its fight with micro rival Apple Computer, Inc. two weeks ago, but the out-of-court settlement left unanswered the question of whether an operating system embedded in read-only memory (ROM) can be protected by copyright, legal experts said last week.

Franklin agreed to pay Apple $2.5 million and to accept the validity of Apple's copyright claims. The Cherry Hill, N.J.-based maker of Apple-compatible micros was given until April 1 to quit copying Apple's operating code [CW, Jan. 9].

"Settlements don't affect the larger legal issues except for those between the parties involved," Daniel T. Brooks, staff attorney for the Computer Law Association, said from Springfield, Va. "The larger legal issues are still lying on the table."

Issues not addressed

The settlement "undercuts the ability of the Supreme Court to address the issues," Brooks lamented. "Somebody else now has to take it to that level."

A Philadelphia Appeals Court had ruled in favor of Apple's copyright claims last fall [CW, Sept. 12, 1983]. In announcing the settlement earlier this month, Franklin President Avram Miller said his company was accepting the appeals court ruling "as law."

But Washington copyright attorney Jon A. Baumgarten, who was retained by Franklin after the appeals court ruling, noted that "all the court said is that an operating system is not per se uncopyrightable." No high-level U.S. court has had the opportunity "to examine any particular operating system," Baumgarten pointed out.

"The current state [of law] is that there are still large issues remaining to be resolved. All that has really been settled is the categorical question: Computer programs are a 'category' [protected by copyright] like books or pieces of music," Baumgarten said.

Apple lawyers disagree

Apple's attorneys disagreed. "The case resolved quite a number of issues," maintained Jeffrey Blatt, a Beverly Hills, Calif., lawyer who represented Apple in the case. "I don't really think there's a question that object code is protected if it sits in ROM."

Blatt said that "it's always nice if the Supreme Court takes the case" to settle the issue for good, but even so "the law is much clearer now than when we started. [Franklin v. Apple] did its job. It has been cited, has already been used as a precedent [in other cases]."

According to the lawyers who spoke to *Computerworld*, the legal issues still to be settled include what Baumgarten called "second-generation questions," such as whether gate arrays or even printed-circuit boards can be shielded by copyright legislation.

Blatt pointed out that circuit boards are covered by copyright laws in Great Britain.

"My feeling is that what an electrical engineer does to design a circuit is not copyrightable. But what a software programmer does is. He's preparing a 'work of authorship,'" Brooks said.

Another question left unanswered by the settlement is whether the computers of two manufacturers can ever be "bit-to-bit compatible" without identical operating codes, according to Brooks.

"The larger the number of bit variations, the greater the potential that somebody sometime will discover a program which won't run on both," Brooks said.

Meanwhile, Franklin is preparing an operating system that it says will be able to run any Apple application program. Franklin computers running on the new operating system will hit the market before April 1, Miller promised.

Third-party arbitrator

If Apple believes the new operating system still infringes on its copyright, a third-party arbitrator will settle the dispute. Blatt said the two micro vendors were in the process of choosing the arbitrator.

As for the $2.5 million settlement, which had been called low by some, Brooks said, "That's not bad for a royalty [payment]."

Franklin expects to have sold about 100,000 boxes with the Apple-identical operating system. That works out to about $25 per box in "royalties."

While Blatt would not say if Apple viewed the $2.5 million settlement as a royalty payment for past infringements by Franklin, he nevertheless said it is "typical" for the loser in a copyright case to pay royalties to the winner.

NCR

From the cutting edge
of NCR software engineering comes
NCR/SNA Systems Network Architecture

If you are a computer manufacturer, or an OEM, there are two ways that you can implement SNA or X.25 on your systems:

- Do it yourself.
- Call NCR.

NCR systems engineers have developed portable communication products which can be easily implemented on a variety of processors and operating systems. These products allow for SNA communications, SNA network management and communication using X.25. Many of the products are immediately available, and could be ported onto most processors with minimum effort. And that's not all. NCR/SNA is backed by the resources and experience of an international company with a long background in data processing, and with the engineering technology that will keep it among the leaders.

In 1984, NCR will become 100 years young. If you are going to make a major investment in a strategic product, you'll want the innovative technology and service for which NCR has long been famous.

If you would like more information contact:

NCR Corporation
11010 Torreyana Road
San Diego, California 92121
Phone (619) 452-1020

If you are an NCR computer user, and would like to learn more about SNA implementation on NCR's Systems, contact your local Account Manager.

AI-like package sends helicopter designer soaring

1ST USER

By Paul Gillin
CW Staff

CULVER CITY, Calif. — Can seven Army pilots with no programming knowledge teach a computer to think like a military commander in less than two days?

Analysts at Hughes Helicopters, Inc., a designer of helicopters for commercial and Department of Defense (DOD) use, think they can. As a result, the company became the first commercial user of an artificial intelligence-like software package that reportedly can be used for any application requiring an expert system.

Hughes uses The Intelligent Machine Model (Timm) from General Research Corp. of Santa Barbara, Calif., to simulate the decisions an enemy commander might make when faced with an air attack. The data is used to make design decisions for the helicopters Hughes builds for the DOD.

While Timm is rudimentary in many respects, the analysts have found that the decisions it makes closely parallel those of military experts, according to Bill George, an operations research analyst.

Unusual application

Hughes installed Timm on its Prime Computer, Inc. 400 processor three months ago after it found that no expert systems on the market were suitable for their unusual application. Hughes built its own expert data base by drawing on a group of seven army pilots from Fort Lewis, near Tacoma, Wash.

"We're not experts, so we wanted experts to input the criteria so we can make decisions based on expert knowledge," George said. The pilots spent two days presenting the scenario, the decision structure for the problem, the possible decisions and which factors were important to each decision.

The knowledge base can be built several ways, George explained. The software can randomly generate a scenario and present it to an expert who inputs the best decision under the circumstances. Factors can also be input manually and assigned a weight, or the software can generate a random case and a decision that is approved or corrected by an expert.

To build the war games model, the analysts generated a few random scenarios and then let the pilots take over. "Usually, in a short period of time you have the people sitting down and writing it all by themselves," George said.

Timm prompts the experts to define the problem domain and the set of possible solutions. Each decision adds to the knowledge base, which is capable of storing about 500 rules.

"The more rules you put in, the more intelligent it becomes," George said. "You could crank out several hundred rules in a few hours."

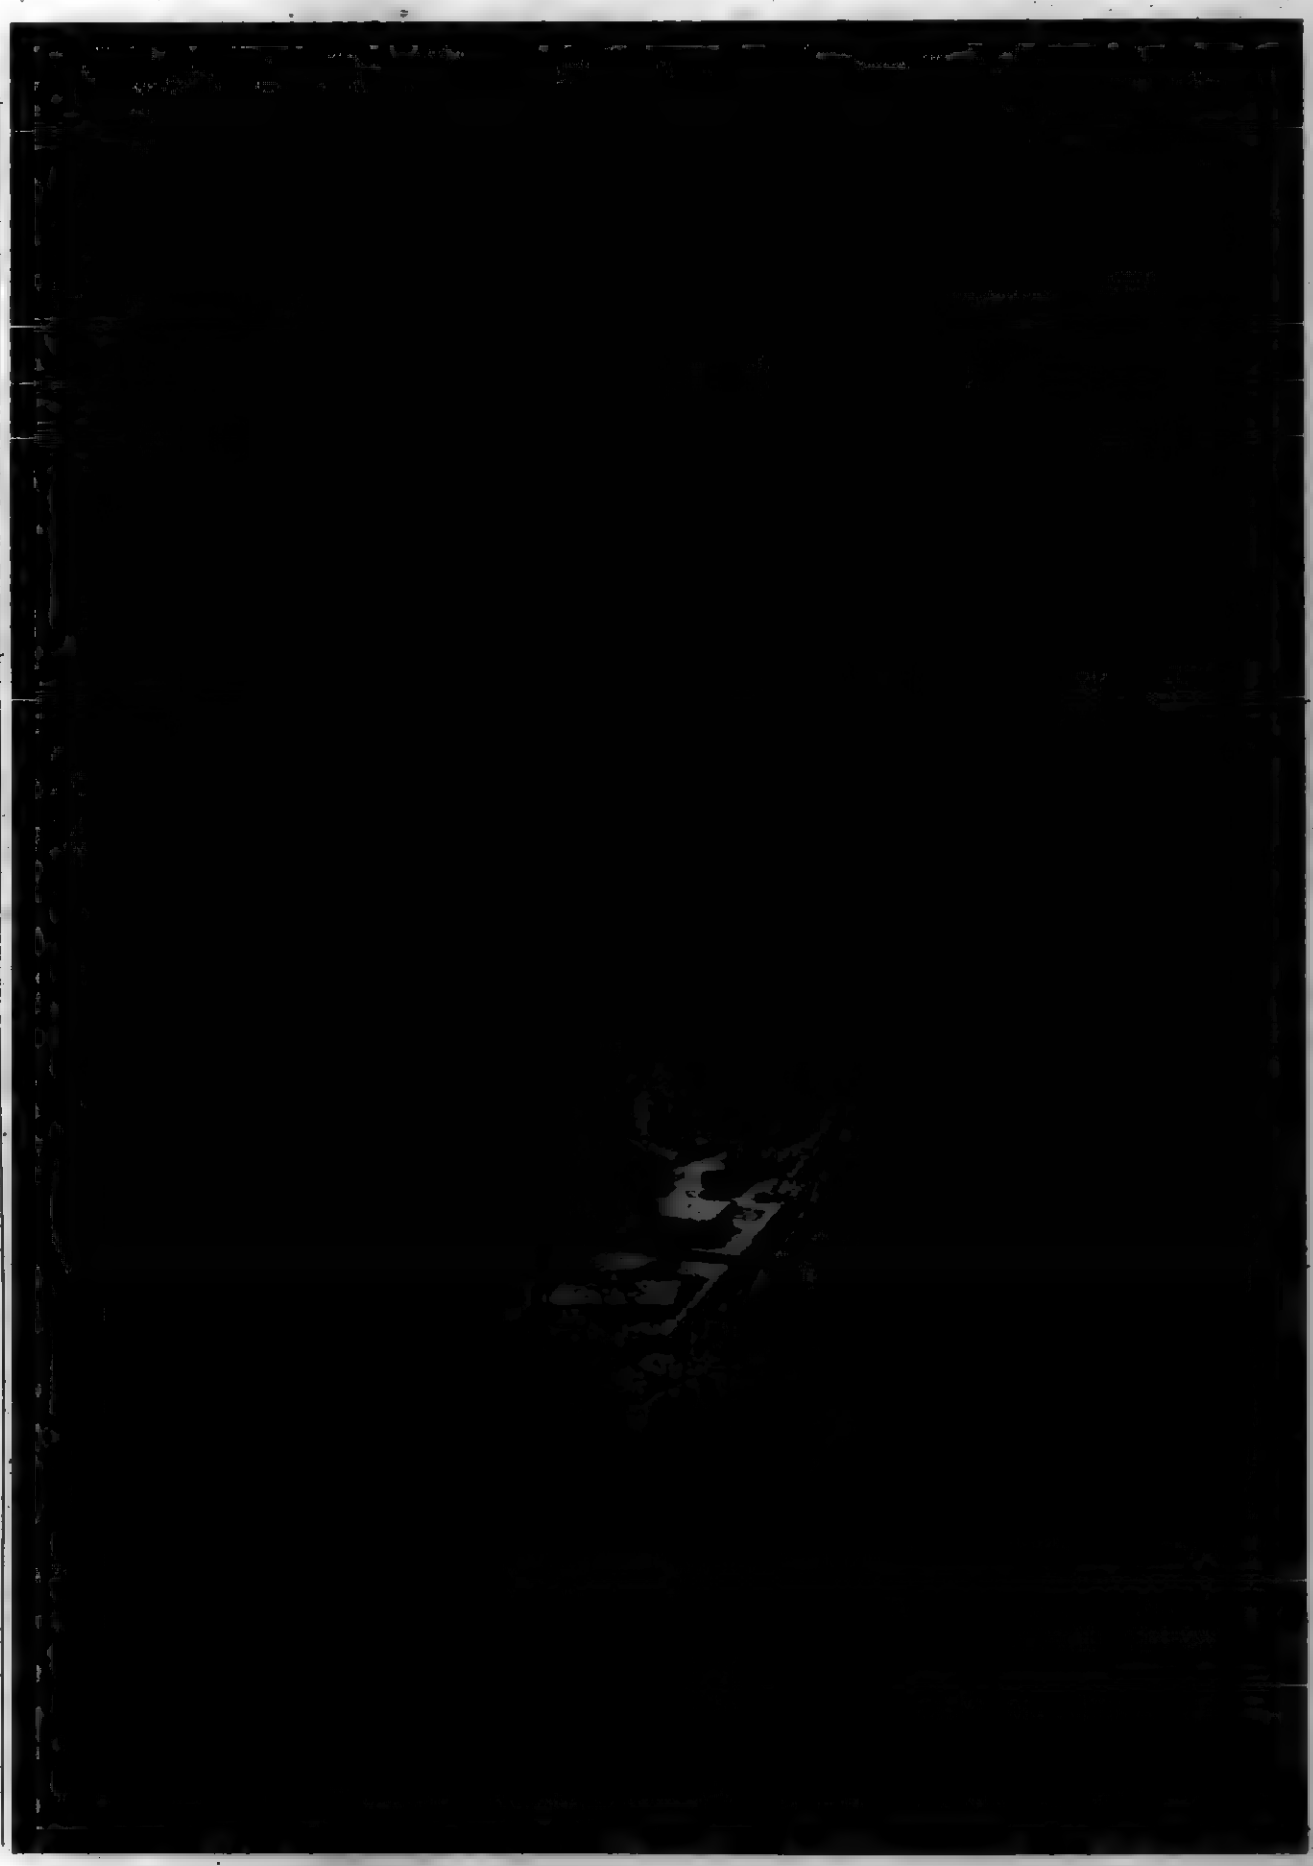
The software is capable of making as many as 25 distinct decisions based upon up to 50 factors and 25 different values for each factor, he said.

Whenever there is a split body of opinion on a decision, the software points out the inconsistency and makes the decision that is statistically the most valid.

All decisions can be rated on a 100-point scale by consistency, and a reliability estimate can also be provided. Timm is also capable of producing a list of the criteria it used to make a decision, George said.

However, Timm does carry a price, George noted. Because the software is application-independent, it is crude as far as specialized expert systems go, he said. It also demands about 20M bytes of virtual memory.

"It's hard to say if this is a true artificial intelligence model, but I don't know of anybody else who has one like it," he said.



Computer helps clients insure against Mother Nature

By James Connolly
CW Staff

JERICHO, N.Y. — A company bets against Mother Nature here, setting computerized odds on whether it will rain in Miami next week or snow in St. Paul, Minn., next month.

Good Weather International, Inc. arranges insurance for businesses whose economic lives depend on the weather, and it does this by drawing on a data base of more than 200M bytes and a hard-copy library of weather reports going back 40 years from 7,000 weather stations.

For 25 years, Good Weather has arranged insurance for concert and air show promoters, film producers and swimsuit makers who need one-time or seasonal guarantees of sunshine so they can plan their business. Others, such as ski equipment firms and mens' outdoor-ware makers, want wintry weather early and often.

But the company has recently taken on new clients, firms like the Toro Co., which guarantees snow for its snowblower customers, and Republic Airlines, which promises fun in the sun for vacationers.

It's Good Weather International that figures the odds of bad weather and pays up — with financial backing from the American International Group — if the rain hits and the snow doesn't.

"We arrange every conceivable type of insurance that has to do with the weather. We're not dealing with individuals, but with big companies that have seasonally sensitive products. Extremes in the weather play havoc with their cash flows. One bad season, they can generally stand it. But two bad seasons in a row, and they may be out of business. That's where we come in," said Good Weather President Henry Fox.

Good Weather simply determines whether precipitation is likely for a given time period by counting the number of times the National Weather Service has measured even one one-hundredth of an inch of precipitation for a site and date in the past 30 or 40 years.

Until the past few months, those calculations and checks of years' worth of records were done by hand, with Good Weather's staff leafing through weather service reports.

Moving up to a mainframe

Now, with companies like Toro and Republic marketing weather guarantees, Good Weather is experimenting with an IBM System/23 Datamaster office system and hopes to move up to an IBM mainframe, either a Series/34 or a Series/36 next year.

"We have 200M bytes of information just on rain alone, so we are going to need a larger system," Fox said.

"What the computer will let us do is get deeper into what we call weather trending," he continued. "What we have been doing is looking at a 30- to 40-year history and coming up with odds. What is more important is the trend."

Fox, who hired programmers to work in-house on the projection programs, won't reveal his company's accuracy rate. But he maintained, "We do have an excellent success rate because we are dealing strictly with the law of averages. We will pay some large losses. Some people will beat us, as the case may be. But with the law of averages, we usually come out ahead."

On the average, Good Weather — which writes policies on behalf of many of the 200 insurance companies that are subsidiaries of American International Group — sets premiums of 5% to 10% to insure single events, such as concerts, against rainouts or to offer swimsuit manufacturers guarantees against poor vacation seasons. Good Weather is managing general agent for the insurance group.

Toro spokeswoman Jane Cella declined to reveal what premiums Toro is paying for its promotion, in which the company offers full rebates to snow-thrower purchasers if the snowfall is less than 20% of the local norm and 50% rebates if the snowfall is 20% to 50% less than the norm.

Republic ticket holders traveling to Southern California, Florida and Arizona are guaranteed their money back if it rains between 10 a.m. and 4 p.m. on more than half of their vacation days.

In Republic's case, the premium costs the airline from 1% of the ticket price to 5%, depending upon the destination.

It is a promotion where Republic reportedly has little risk. A customer buys their original ticket, and if it rains on their vacation, the insurer pays for another round-trip ticket, also from Republic.

The promotions by both companies are being backed by insurance policies arranged through Good Weather International.

Those policies generally are very simply worded, saying that the client can collect if the weather service reports a specific amount of precipitation, or less than that amount in the case of snow, for the dates in question.

Once the policy is written, Fox noted, the question of whether someone collects is determined by the weather service's regular reports, not by Good Weather.

MicroAge

"BECAUSE WE COULDN'T AFFORD MISTAKES!"

"They guided us over the rough parts when we needed it"

"During September of 1982, we started our MicroAge Computer Store in Tulsa, Oklahoma with 3 people. Today we have 11 people working for us and we're still hiring. By following MicroAge's advice and marketing strategy when we started in business, we were able to reach Tulsa's business computer buyers in a much shorter time than we could have on our own."

"Both of us had technical backgrounds in computers but lacked the marketing experience necessary to reach our goals. We used MicroAge's experience and leadership to guide us through the rough spots and boost our sales and marketing potential.

"MicroAge . . . they helped us build a sales organization to reach the Oklahoma businessman."

IEEE forum set for D.C.

WASHINGTON, D.C. — Keeping U.S. technology competitive in the world marketplace into the 21st century will be the focus of the Institute of Electrical and Electronics Engineers, Inc. (IEEE) 1984 Conference of U.S. Technology Policy, scheduled to take place here Feb. 22-23.

The conference will feature 11 speakers, including a yet-to-be-named White House official who will be introduced the evening of Feb. 22 by IEEE President Richard J. Gowen.

The theme of the two-day conference is "Electrotechnology and Innovation: Challenge 21." Dr. Simon Ramo of TRW, Inc.; Dr. George Keyworth, director of the White House Office of Science and Technology Policy; and Dr. Richard DeLauer, under secretary of defense for research and engineering, will open the conference.

Other congressional, industrial and academic figures will also make presentations.

The registration fee is $150 before Jan. 20 and $175 after that date. Registration forms are available from Lisa I. Ladaw at the IEEE Washington Office, Suite 608, 1111-19th St. N.W., Washington, D.C. 20036.

Gould users to meet

ANAHEIM, Calif. — The Gould Users Group will hold a general meeting Jan. 25-27 at the Sheraton-Anaheim Hotel here.

The agenda will include user presentations, workshops, presentations by Gould, Inc. and a panel discussion with Gould management, according to Steve Larkin, chairman of the Gould Users Group.

The advance registration fee is $35 per person; a $10 surcharge will be added to anyone registering the first day of the meeting. The registration fee includes all seminar materials as well as lunch on each day. More information is available from Eileen Lerner, Users Group Administrator, Gould, 6901 W. Sunrise Blvd., Fort Lauderdale, Fla. 33310.

IT is...

the leader in integrated decision support and data processing software.

Ten programs, each separately available, make the IT series the most comprehensive and flexible software system on the market for MS-DOS based personal computers.

Non-computer professionals will find IT easy to use. All programs are menu-driven and make extensive use of help screens. And for the DP professional, ITSoftware programs meet the kinds of operational data processing requirements that are now justified by the low cost of today's microcomputer hardware and software.

Whatever your requirements, you'll discover that ITSoftware meets more of your needs.

KeepIT™ keeps IT together.

At the heart of the ITSoftware series is KeepIT, a menu-driven, relational data base manager that acts as the core module through which all other software is integrated. Only a full data base management program like KeepIT can provide the flexibility of data entry, file transfer, records maintenance, report generation and file management capabilities needed to fully utilize the data calculation and presentation strengths of spreadsheet, graphics and word processing programs.

KeepIT's comprehensive design greatly extends the ability to transfer information from one program to another. Not just for a few numbers, but for entire data files. KeepIT also allows you to specify calculations on the data base and have the results transferred to a spreadsheet or graphics program.

Best of all, you don't have to replace your current software to take advantage of ITSoftware's advanced capabilities. Use them both. KeepIT also comes equipped with interfaces to most other popular micro-based software.

Other members of the ITSoftware series include:

CalcIT™: 3-D spreadsheet program.
LinkIT™: asynchronous communications package.
PassIT™: 3270 file transfer facility.
EditIT™: program editor with mouse management.
SortIT™: sort/merge utility.
StatIT™: MathStat™ program.
WritIT™: our release of MultiMate™ for word processing.
ShowIT™: graphics and drawing program.
SendIT™: for remote presentation of ShowIT slides.

Buy IT.

ITSoftware . . . ask for IT by name. For more information, call toll-free (800) 222-0592. In New Jersey: (609) 799-2600. Or write to ITSoftware, P.O. Box 2392, Princeton, New Jersey 08540. We'll send you a free brochure.

BRAZIL

RIO DE JANEIRO — Brazil's Special Department of Informatics has established new criteria for manufacturers of microcomputers here. Projects that relate to the production of microcomputers will only be approved by the government if the machine's operating system has been developed locally.

RIO DE JANEIRO — Brazil's Association of Information Services Organization last month announced the signing of agreements with IBM and Control Data Corp. for the joint development of products here. Sources said the IBM agreement calls for the translation of IBM documentation manuals; the CDC agreement covers software development, sources said.

RIO DE JANEIRO — According to a recent report from the Special Department of Informatics, Brazil's financial sector is responsible for half the information processing equipment sold in this country. The banks here, which have started to install 24-hour automatic teller machines, are reportedly appealing to the domestic computer industry for more diversification of products.

FRANCE

PARIS — The French Citibank has become the first user here of Wang Laboratories, Inc.'s Wangnet broadband local-area network. Citibank installed the local-area network in one of its new buildings to interconnect hundreds of word processing systems, terminals and Wang CPUs. The bank is now studying the feasibility of connecting IBM machines to Wangnet.

PARIS — What is IBM's answer to the threat posed by Trilogy Systems Corp.? Some are predicting price wars between the two companies in 1985. Others believe the battle will involve IBM's thermal conduction module technology and Trilogy's wafer-scale integration packaging technology.

Speaking on this subject here recently, IBM's director of component research and development, Stephen Paris, said that circuit integration could eventually be improved by two or three times, which would enable IBM to create monoprocessors operating at 15 million to 16 million instructions per second (Mips). At present, monoprocessors execute approximately 7 Mips with thermal conduction module technology.

PARIS — One hundred all-purpose Minitel videotex terminals have been distributed to selected members of the French National Assembly, and an additional 370 terminals will be added to the system by March. In addition to nightly updates on proposed laws, deputies can use the terminals to keep abreast of the daily agenda and for immediate research on legal matters, economic and domestic affairs.

The terminal also serves as an electronic mailbox. The Minitel videotex system interfaces with three separate data bases. The system includes a micro videotex server which stores up to 10 million characters.

JAPAN

MATSUMOTO — Epson Corp., a subsidiary of Seiko Group which manufactures microcomputers and printers, plans to establish a manufacturing plant in California that would begin production by 1986. Last October, the company founded a French subsidiary called Epson France to provide its product line to the European marketplace.

NETHERLANDS

AMSTERDAM — Shares of the Dutch software company Minihouse went "over-the-counter" on the London Stock Exchange recently, a move that sparked general confusion and calamity in the Dutch financial world.

When financiers questioned why the company did not use the Amsterdam Stock Exchange, a company spokesman said London was used for the stock offering because Dutch financial organizations are still reluctant investors when it comes to systems houses and software companies. Minihouse added that its stocks will eventually be made available in Amsterdam.

AMSTERDAM — During the first quarter of this year, European postal, telephone and telegraph (PTT) administrations are expected to connect their X.25 packet-switched public data networks. This month the Dutch PTT will connect its Datanet-1 to England's network, followed by the networks of Belgium, France, Spain and Switzerland. The X.25 networks of the U. S. and Canada and other European countries are planned for a later date, a spokesman said.

The newly formed European network will replace Euronet, but the management company of Euronet will reportedly be maintained.

AMSTERDAM — The European Common Users Group for users of the IBM System/34, 36, 38, Series/1 and 8100 information system is expanding its membership abroad and forming Common groups here and in Scandinavian countries. In Holland, the management of Common will be handled by the Amsterdam-based software house Information Share, a nonprofit subsidiary of Management Share.

HILVERSUM — Sopho-Net is the name of a switching network recently released by Philips Telecommunications BV that works by interchanging packets at high speeds. The product can reportedly handle all types of communications in a unified system of electronic lines.

According to Philips, Sopho-Net was designed to become the keystone of the integrated information network in the "office of tomorrow" and is compatible with all kinds of equipment including systems from Digital Equipment Corp. and IBM.

Further details are available from Philips at P.O. Box 32, 1200 JD Hilversum, Netherlands.

NEWS

On-line litigation library built for Baldwin-United case

DAYTON, Ohio — An on-line litigation information library was recently initiated to serve interested parties in what may be one of the most complicated bankruptcy cases in U.S. history.

Mead Data Central, a division of the Mead Corp., initiated the library in early January on both its Lexis and Nexis information retrieval services.

The library will document the Chapter 11 reorganization of the Baldwin-United Corp. of Cincinnati. U.S. Bankruptcy Court Judge Randall Newsome is overseeing the reorganization.

Baldwin-United and two of its subsidiaries, D.H. Baldwin Co. and Baldwin-United Leasing Co., filed for reorganization under Chapter 11 of the U.S. Bankruptcy Code on Sept. 26, 1983.

Several thousand creditors

There are several thousand creditors involved in the case, ranging from large banks to individuals who purchased annuities from Baldwin's insurance subsidiaries. The reorganization could take up to four years of court proceedings to accomplish, according to a spokesman for Mead Data Central.

Mead Data Central President Jack W. Simpson, in announcing the service, stated, "The Baldwin-United Litigation Library is being created to give debtors' and creditors' counsel [and] news media and other interested parties quick, easy access to the huge volume of material that will be generated by the impending litigation."

Mead Data Central has helped clients create their own private libraries since 1975, but the Baldwin-United library is the first such data base of litigation material on a single case to be open to the public.

The company said a member of one of the creditors' committees involved in the litigation will help prepare documents for inclusion in the data base. New documents will reportedly be available on-line within 10 days of filing with the court.

The library will reportedly contain transcripts of the trial and all public comments filed with the court since the original filing, including affidavits, motions and supporting memoranda, briefs and orders of the court. An on-line index of all documents filed with the court will be available to users of the two retrieval systems.

Nexis is available for a minimum monthly fee of $60, with no charge for the Nexis terminal; Lexis is available for a monthly library access fee of $100 and terminal rental fee of $55 from Mead Data Central, P.O. Box 933, 9333 Springboro Pike, Dayton, Ohio 45401.

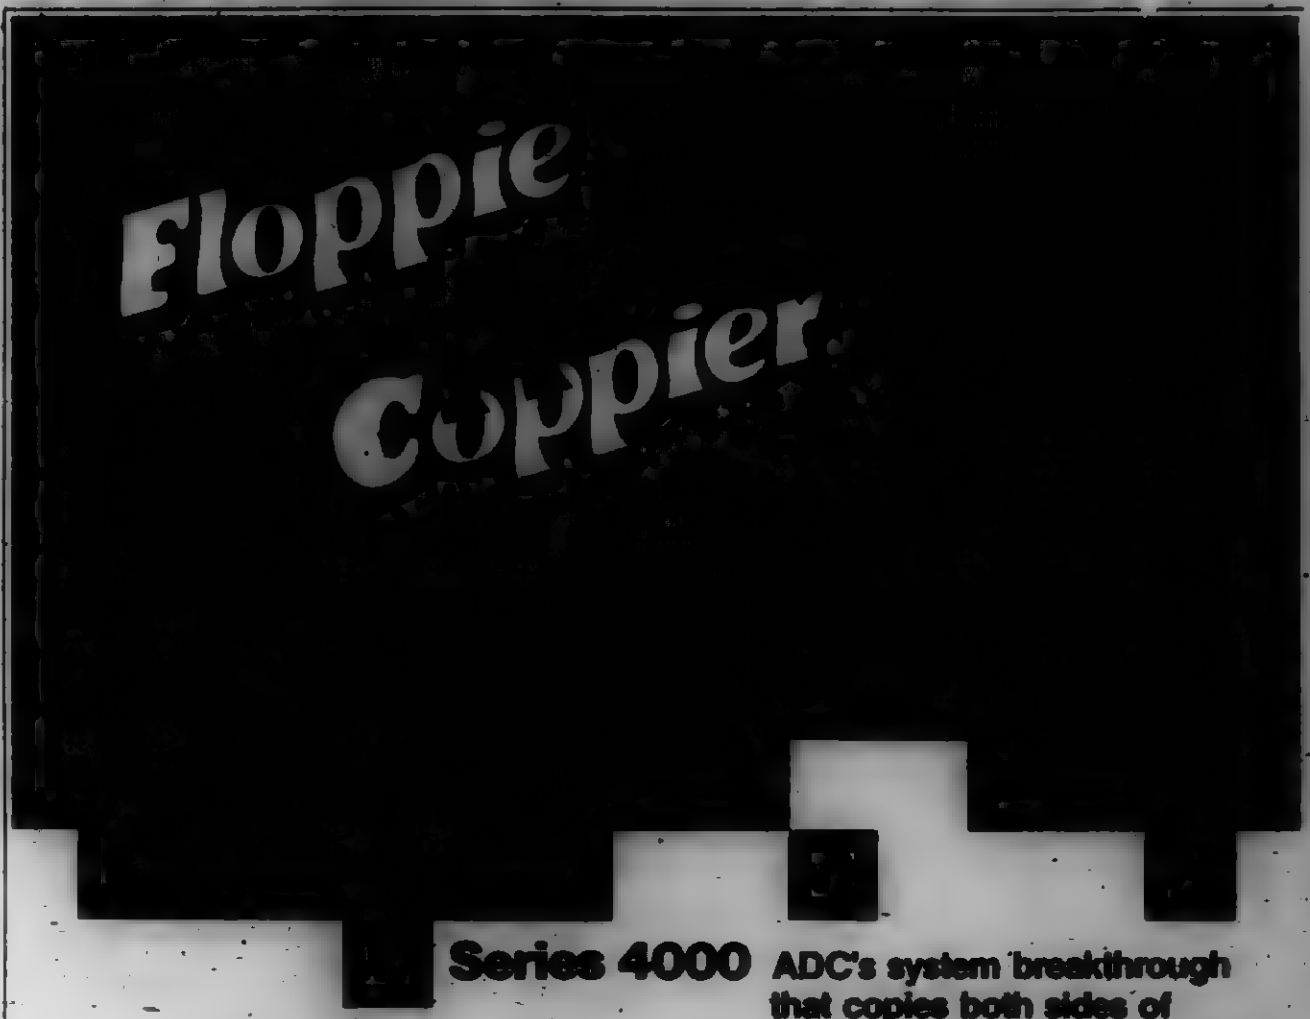
Press office, cabinet tied

WASHINGTON, D.C. — A computer link was recently established between the White House press office and the public information offices of the cabinet departments to help the flow of information on current issues.

Hooked into IT&T's Dialcom communications system, the press office utilizes an electronic mail system to communicate with the agencies and a news monitoring system to keep up with the wire services.

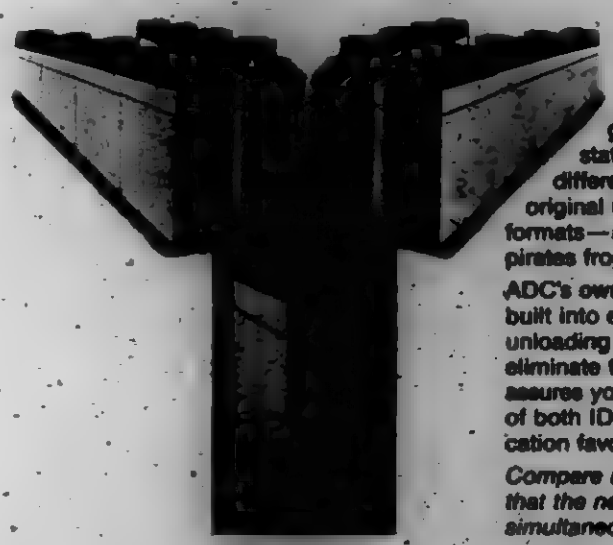
"The purpose of the on-line system is to help advise the agencies about what we're saying on issues of interest to them and for them to advise us on background or to give us talking points on current issues which might come up in one of our daily briefings," said Anson Franklin, assistant press secretary for the White House.

With IBM Displaywriters at work in the press office, the communications link has been successful so far, according to Franklin.



Series 4000 ADC's system breakthrough that copies both sides of double-sided diskettes at once!

Just as efficiently and smoothly as your office copier, ADC's new Series 4000 Floppie Coppier™ automatically initializes and copies thousands of duplicate diskettes per hour—and doubles your throughput for double-sided diskettes!



Unlike other blackbox-type duplicators, Series 4000 gives you total single-master control of up to 16 slave stations—each simultaneously working on an entirely different diskette size and format. Since inventing the original Floppie Coppier, ADC's developed over 300 different formats—and dozens of different protection schemes to prevent pirates from copying your Floppie Coppier "coppies."

ADC's own industry-standard-setting Robotic Disk Handler is built into each Series 4000 slave unit, automatically loading and unloading up to 100 diskettes with patented gentle fingers that eliminate the disk destruction of other systems. Floppie Coppier assures you of perfect "coppies" every time with true CRC control of both ID and data fields, instead of the indiscriminate duplication favored by some of our copy-cat imitators.

Compare and you'll come back to the original—especially now that the new Floppie Coppier is even further ahead with simultaneous double-sided duplication—another ADC first!

CALENDAR

WEEK OF JAN. 22

JANUARY 23-27, TRUMBULL, CONN. — **Introduction to Unix.** Contact: Gregory Geiger, Bunker Ramo Information Systems, Trumbull Industrial Park, 35 Nutmeg Drive, Trumbull, Conn. 06609.

JANUARY 23-27, DALLAS — **CICS/VS Internals.** Contact: On-Line Software International, Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

JANUARY 24, NEW YORK — **CICS/VS Logic and Debugging.** Contact: On-Line Software International, Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Jan. 26 and Jan. 31 in New York.

JANUARY 24-26, SAN JOSE, CALIF. — **Advanced Semiconductor Equipment Exposition and Technical Conference.** Contact: Cartlidge and Associates, Inc., Suite 305, 4030 Moorpark Ave., San Jose, Calif. 95117.

JANUARY 24-26, IRVING, TEXAS — **SAS Basics Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511. Also being held Jan. 24-26 in Cary, N.C.

JANUARY 24-26, ARLINGTON, VA. — **SAS Basics (Portable) Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

JANUARY 24-27, BOSTON — **Computer Graphics.** Contact: Integrated Computer Systems, 3304 Pico Blvd., P.O. Box 5339, Santa Monica, Calif. 90405.

JANUARY 25, TRUMBULL, CONN. — **Unix Marketing.** Contact: Gregory Geiger, Bunker Ramo Information Systems, Trumbull Industrial Park, 35 Nutmeg Drive, Trumbull, Conn. 06609.

JANUARY 25-26, CARY, N.C. — **SAS Color Graphics Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

JANUARY 25-27, EAST RUTHERFORD, N.J. — **The Business Telecommunications Exposition.** Contact: The Exposition Group, 9128 Columbia Ave., North Bergen, N.J. 07047.

JANUARY 25-27, NASHUA, N.H. — **Preventive Maintenance and the Personal Computer.** Contact: New Hampshire College Resource Center, New Hampshire College, 2500 N. River Road, Manchester, N.H. 03104.

JANUARY 25-27, LOS ANGELES — **Computers in Manufacturing.** Contact: National Institute for Management Research, P.O. Box 3727, Santa Monica, Calif. 90403.

JANUARY 26-27, LAS VEGAS — **Computers in Construction.** Contact: CIP Information Services, Inc., 1105-F Spring St., Silver Spring, Md. 20910.

JANUARY 26-28, ORLANDO, FLA. — **The Southeastern Regional Office Machine Dealers Association Meet (Bermuda '84).** Contact: Sergenda, Inc., Suite 205, 5115 Maryland Way, Brentwood, Tenn. 37027.

JANUARY 27-29, HOUSTON — **Resource '84.** Contact: Joyce Fadem, Professional Resources, Inc., P.O. Box 740433, Houston, Texas 77274.

WEEK OF JAN. 29

FEBRUARY 1, NEW YORK — **Advanced Disease.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 7th Ave., New York, N.Y. 10123.

FEBRUARY 1-2, DALLAS — **Recovery/Restart.** Contact: On-Line Software International, Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

FEBRUARY 1-2, SUNNYVALE/SAN JOSE, CALIF. — **Data Communication for Personal Computers.** Contact: Center for Advanced Data Processing, Inc., Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

FEBRUARY 1-3, LOS ANGELES — **SAS Macro Language Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

FEBRUARY 1-3, NEW BRUNSWICK, N.J. — **Data Base Management.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held Feb. 6-8 in San Jose, Calif.

FEBRUARY 1-3, KANSAS CITY, MO. — **Office Automation and Integration.** Contact: Data-Tech Institute, 386 Franklin Ave., P.O. Box 569, Nutley, N.J. 07110. Also being held Feb. 8-10 in Boston.

FEBRUARY 1-3, HOUSTON — **Unix.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held Feb. 6-8 in Boston.

FEBRUARY 1-3, HOUSTON — **The PC World Exposition.** Contact: Karen Bartnicki, CW Communications, Inc., 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

FEBRUARY 1-3, ANAHEIM, CALIF. — **Networking Personal Computers.** Contact: Data-Tech Institute, 386 Franklin Ave., P.O. Box 569, Nutley, N.J. 07110. Also being held Feb. 8-10 in Washington, D.C.

FEBRUARY 1-3, ST. LOUIS — **Data Communications Systems.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held Feb. 6-8 in Pittsburgh.

FEBRUARY 1-3, DALLAS — **Relational Data Bases.** Contact: Software Institute of America, 339 Salem St., Wakefield, Mass. 01880. Also being held Feb. 6-8 in Boston.

FEBRUARY 1-3, SAN DIEGO — **Network Communications Protocols.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held Feb. 6-8 in Atlanta and Feb. 15-17 in New York.

FEBRUARY 1-3, DETROIT — **Personal Computers and Networking.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held Feb. 6-8 in Houston and Feb. 13-15 in Montreal.

FEBRUARY 2, NEW YORK — **Word Processing With Wordstar.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 7th Ave., New York, N.Y. 10123.

FEBRUARY 2-3, BOSTON — **Automating Rehabilitation Facilities With Microcomputers.** Contact: Management Information Systems, National Easter Seal Society, 2023 W. Ogden Ave., Chicago, Ill. 60612

FEBRUARY 2-3, ORLANDO, FLA. — **Local Networks: Strategies for Success.** Contact: Architecture Technology Corp., P.O. Box 24344, Minneapolis, Minn. 55424. Also being held Feb. 9-10 in Phoenix, Feb. 16-17 in Washington, D.C., and Feb. 29-March 1 in San Francisco.

FEBRUARY 2-3, WASHINGTON, D.C. — **Micro/Personal Computer Operating Systems.** Contact: Software Institute of America, 330 Salem St., Wakefield, Mass. 01880.

FEBRUARY 2-3, DENVER — **Networking Personal Computers.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940. Also being held Feb. 6-7 in St. Louis.

FEBRUARY 2-5, HOUSTON — **IBM PC World Exposition.** Contact: Mitch Hall Associates, P.O. Box 360, Westwood, Mass. 02090.

FEBRUARY 3-5, RENO, NEV. — **Sage Faire '84.** Contact: Sage Faire '84, 4905 Energy Way, Reno, Nev. 89502.

WEEK OF FEB. 5

FEBRUARY 6, NEW YORK — **Introduction to IBM Personal Computer.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 7th Ave., New York, N.Y. 10123.

FEBRUARY 6-7, DALLAS — **Managing Information Centers Effectively.** Contact: Association for Systems Management, 24587 Bagley Road, Cleveland, Ohio 44138. Also being held Feb. 13-14 in Cincinnati.

FEBRUARY 6-8, NEW YORK — **X.25 and Packet-Switching Networks.** Contact: Systems Technology Forum, Inc., 9000 Fern Park Drive, Burke, Va. 22015.

FEBRUARY 6-8, BOSTON — **Relational Data Bases.** Contact: Software Institute of America, 330 Salem St., Wakefield, Mass. 01880.

FEBRUARY 6-8, BOSTON — **Networking Personal Computers.** Contact: Personal Computer Management Association, 11928 N. Earlham, Orange, Calif. 92660. Also being held Feb. 13-15 in Denver and Feb. 27-29 in Orlando, Fla.

FEBRUARY 6-8, WASHINGTON, D.C.— **Data Communications: Network, Design and Optimization.** Contact: Institute for Advanced Technology, 6003 Executive Blvd., Rockville, Md. 20852.

FEBRUARY 6-8, WASHINGTON, D.C.— **Introduction to Data Communications.** Contact: Systems Technology Forum, Inc., 9000 Fern Park Drive, Burke, Va. 22015. Also being held Feb. 22-24 in New York and Feb. 27-29 in Denver and San Francisco.

FEBRUARY 6-8, ORLANDO, FLA. — **DP Disaster Recovery.** Contact: EDP Security, Inc., 181 West St., Waltham, Mass. 02154.

FEBRUARY 6-8, MINNEAPOLIS — **Micro and Personal Computers: Technology and Applications.** Contact: Institute for Advanced Technology, 6003 Executive Blvd., Rockville, Md. 20852.

FEBRUARY 6-9, NEW YORK — **IMS/DB (DL/1) Application Programming.** Contact: On-Line Software International, Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

We've made it so easy to build expert systems, all you need is a pair of scissors.

It's true. With TIMM™ (The Intelligent Machine Model), just about anyone can now build a powerful expert system. Quickly. Easily. Without knowing a thing about computers. Just send us the coupon or call, and we'll tell you all about this exciting breakthrough in artificial intelligence. Here are just some of TIMM's features:

- Knowledge engineering embedded in software
- Lets you quickly build prototype systems
- Is "domain-independent"
- Checks for consistency and completeness
- Learns by example, generalizes knowledge

The Software Workshop®

Artificial Intelligence Laboratory • General Research Corporation

More and more, personal computers in large organizations are dramatically improving productivity. But there's also a problem involved with this improvement. People are using many different, often incompatible microcomputers, yet they still need to share information, programs, and peripherals.

It's as if everyone had an automobile, but no highways leading to their destination. No traffic signs to follow. No rules of the road. The result? Mass confusion.

Until now, that is. Until Liaison from SofTech Microsystems.

Based on the p-System,™ the Universal Operating System,™ Liaison is a family of network software products that lets you establish a workable, efficient personal computer network. It allows personal computers and users to co-operate and work together so that your organization is altogether more effective. Liaison includes systems software products, such as an operating system, print servers and disk servers as well as development tools. And, a collection of network applications, including a database management package, electronic mail, and more.

Liaison lets you unite many different personal computers in an effective network. 8 and 16-bit machines from virtually all personal computer manufacturers (including IBM,® TI,® Corvus,® and Apple®) can all share programs, all work together, all co-operate.

So if you're tired of your different personal computers driving you to the brink of insanity, give us a call at SofTech Microsystems.

We'll show you how Liaison can get you back on the road to recovery.

SOFTECH MICROSYSTEMS

Introducing Liaison.™ Software that allows personal computers to co-operate.

EDITORIAL

Interesting deal

Until recently, IBM's information center has been a lot of bark without much bite. While the goals of the information center are well considered — to provide a means for end users to do their own computing — IBM had been reluctant to throw its weight behind any of the myriad software vendors now providing information center tools.

All that is changing now. The announcement this month of a "complementary marketing agreement" between IBM and Comshare, Inc., which makes the System W decision support system, marks another in a series of Big Blue moves to provide some direction to the proliferating information center market.

The IBM-Comshare deal [CW, Jan. 9] followed three important IBM announcements last year. One was an agreement to sell Intellect, the natural language query and reporting product from Artifical Intelligence Corp. of Waltham, Mass. The second was IBM's announcement of an in-house version of its Application System data management and information retrieval package. The third was IBM's announcement of DB2, a relational data base management system targeted primarily for information center use.

The most interesting aspect of the Comshare announcement was its language. While the deal clearly amounts to an endorsement of System W, IBM was emphatic in refusing to term it a joint marketing agreement. IBM sales representatives reportedly will not sell System W, but will be instructed to recommend it as the primary DSS for IBM environments. Comshare will still be charged with selling, supporting and providing end-user training for the software.

In addition, IBM has left itself a convenient "out" in case it takes a shine to a new piece of DSS software. While IBM sales reps are directed to pass along sales leads to Comshare, they are not embargoed from recommending alternative vendors if they so choose.

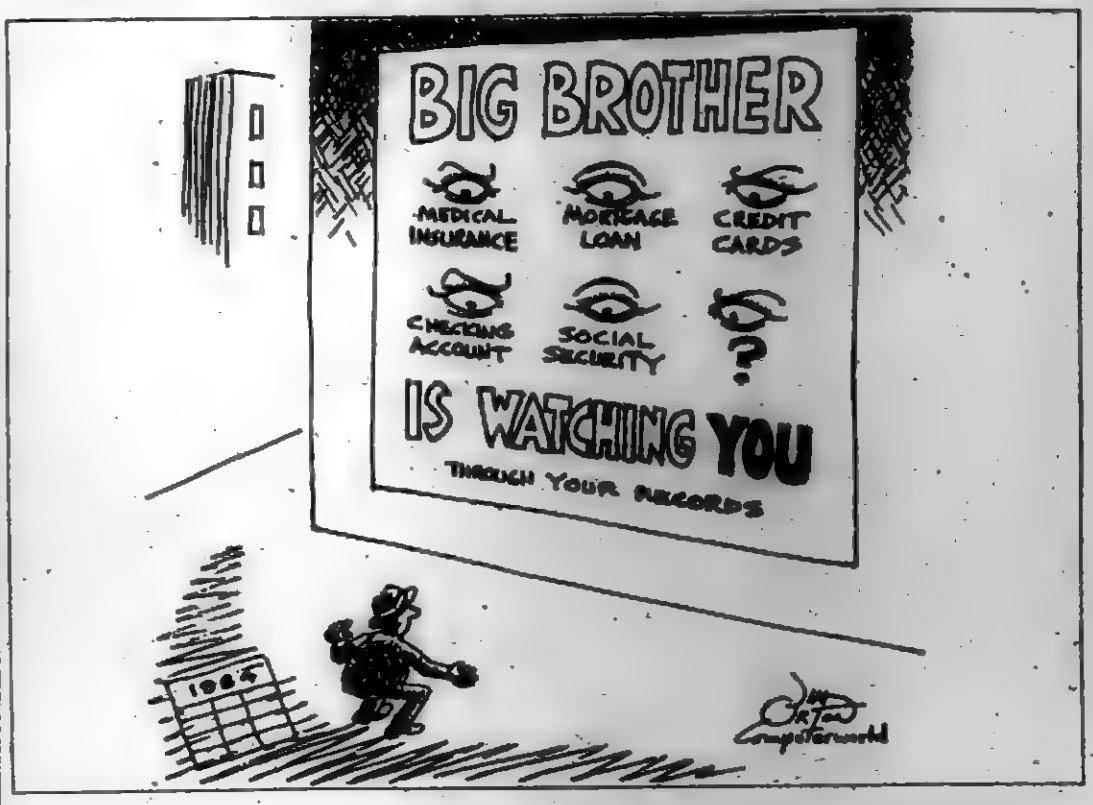
Therein lies the consolation for the DSS vendors that were passed up by Big Blue. Considering that System W has been available in package form for barely a year, it was a bold decision for IBM to choose it over such veteran players as Execucom Systems Corp.'s IFPS, Management Decision Systems, Inc.'s Express and EPS, Inc.'s FCS. However, the agreement is hardly a repudiation of those vendors.

In fact, an IBM spokeswoman said the Comshare deal will be the first of "many announcements" of a similar nature. IBM also said it would continue to offer IFPS on its Information Network, an escape hatch allowing the company to stop short of an all-out endorsement of System W.

At the risk of sounding trite, it is safe to say that users will be the big winners in this latest IBM marketing foray. By bringing Comshare under its wing, IBM has assured customers that the System W software will always be in step with its hardware and operating system environment. In promising future agreements of the same kind, IBM has also hinted that users considering an information center will soon have a range of stable software products from which to choose, all of them blessed and insured by IBM.

With the possible exception of Comshare's competition, software vendors should also take heart from the announcement. In effect, IBM has said that it is willing to endorse a quality product, even if it competes in some areas with IBM software.

Moreover, IBM's success in opening the Personal Computer market to third-party software vendors has apparently led the computer giant to reconsider its attitude toward independent vendors in the mainframe arena. Independents should be encouraged by the message that IBM will look favorably upon software that will help it sell hardware, even if the code originates outside the company.



LETTERS TO THE EDITOR

Electrical matters

Two items in Leo Sharkey's article, "Reorganization Spurred by Manager's Experience" [CW, Dec. 12], require some comment.

The article states: "But Edison could not produce less electricity even though industries were using less." This implies erroneously that a utility generates more electricity than is being demanded by its customers at a given moment. This is a physical impossibility. Detroit Edison and every other electric utility produces exactly the amount of power its customers demand.

Next, the article says: "To halt a power plant's motion, even momentarily, would result in a fatal flat spot on the turbine." I am somewhat at a loss to address the "fatal flat spot on the turbine." Perhaps an oblique reference is being made to the steam turbine rotor distortion that can occur when a spinning rotor is brought to complete rest while the turbine is still hot. Unequal thermal stresses along the vertical diameter of the rotor will cause this massive hunk of metal to distort and bend. Realizing that the parts inside huge steam turbines are fitted to watchmaker tolerances, rotor blades will make contact with stationary components. The result is one bound up mess from which it is extremely difficult to recover.

VIEWPOINT

Just what is quality, anyway?

QUALITY

WAYNE SMITH

Over the next several months, this column will be focusing on software quality and how senior management, together with information services management, can establish and operate a quality data processing function. This will not be a technical dissertation on techniques, methodologies and standards, but rather a look at the issue from an organizational and management viewpoint. Fundamental underlying principles regarding quality programs, their critical success factors and how, specifically, a quality information services organization can actually contribute to improving an organization's bottom line will be discussed. Furthermore, the topics discussed are all well within our current capabilities.

The principal question surrounding any attempt to establish a quality function effectively is: What is quality, anyway? That quality is felt to be a somewhat desirable but, nevertheless, unrealistic and unattainable goal for an information services function is the biggest hurdle senior management must overcome.

No real quality breakthrough will occur until senior management changes its long-held beliefs and opinions that quality is expensive, unattainable and subjective.

These cultural changes are always slow to take place. Moreover, it appears that two major roadblocks stand in the way of a real quality breakthrough:

■ Senior management does not yet recognise that quality in information services is not a subjective measure of relative goodness, but rather is simply "Doing exactly what we say we are going to do, when we say we are going to do it."

■ Information service's inability (along with the quality assurance function's inability) to quantify the cost of quality effectively in the organization. That is, what is the actual cost of shipping defects into production (it is probably several times greater than you think it is), how expensive are missed schedules, what business opportunities are lost (or delayed) due to poor requirements analysis and so on.

First roadblock

The first roadblock, because it has to do with the perception of quality in the organization, represents the essence of the problem. Recognising that quality is nothing more than meeting requirements and that quality information services is the best road to improved productivity requires more than an intellectual understanding by management; it must become part of its mind-set and must positively affect day-to-day decision making. For too long, quality issues were relegated to the technical staff for solution. And, of course, their solutions were primarily technical in nature. Accordingly, there was heavy emphasis on tools, techniques and methodologies that addressed the program development and coding components of the project. As a result, the quality orientation was a technical orientation, focusing on only 10% to 30% of the project effort without exploiting the real quality leverage, namely, the management and organizational strategies.

But what does this new definition of "quality" mean? Embedded in the notion that a quality system is a system that meets requirements are the following issues:

■ The organization must invest in the development of a well-defined, complete and verifiable set of requirements before design and programming begins. This includes not only the traditional business requirements, but also the technical, production and maintenance requirements. In other words, if it is an important enough issue to the organization, then it is worth attempting to define it in the requirements document.

■ These requirements must all meet the following constraint: Can I set up a process whereby an independent agent can verify that the delivered product meets

See QUALITY page 32

Users, DPers should change micro views

HUMAN CONNECTION

JACK STONE

Although sometimes it doesn't seem so, there truly is a farsighted segment of the data processing community that recognizes that the personal computer in stand-alone mode offers cost-effective solutions to a vast number of "smaller" information handling problems that are far too costly to implement on terminal-oriented minis and mainframes. These DPers also appreciate that the added processing overhead on the larger machines is only one factor that is eliminated when the micros off-load some of the work. Just as important, if not more so, is the relief accruing to the analysis and programming teams that can reduce the level of ongoing systems support to the smaller users and devote more of their energies to the solution of the "larger" business problems.

There is no question that end users and DPers alike benefit from the growth of personal computers. Processing power is decentralized in parcels appropriate to operational needs; general-purpose applications packages make the micros a lot easier to work with and faster to adapt to particular requirements; and organizational structures make adjustments in internal procedures to streamline the manual data-handling functions.

Broader scheme of things

But in the broader scheme of things, perhaps the most significant payoff of all is that many users become more knowledgeable about computerized systems, some even achieving high levels of operational independence and the concomitant rewards of reduced frustration and increased productivity. As a result of the experience, enlightened DPers learn that it is in their best interests to support the acquisition of personal computers and, thereby, to relieve the burden of ongoing support.

Unfortunately, such knowledge falls short for a great many people in our industry who evolve distorted, if not widely exaggerated, claims about the role that personal computers should play in modern enterprise.

For example, on the business side, there are those who avow that their flock of personal computers will eventually replace the mainframes because of their attractive operability, maintainability and economic factors. Yet equally bizarre notions are found on the DP side, generally involving the pooh-poohing of personal computers' capabilities and their downgrading to the level of toys, plus the alleged waste of money and manpower in user departments stemming from poor systems designs.

Role of the personal computer

Of course, the role of the personal computer is found in its generic name: personal computers are valuable and cost-beneficial for those information needs of a "personal" nature. One can spend months researching the classes of problems that fall into this category, or take my simplistic approach in which I loosely define "personal" applications as those that are solvable by the computing power you can acquire for $5,000, a somewhat arbitrary clip level, perhaps, but not an unreasonable one in today's budgeting circumstances.

And these days, this investment buys computing components that are vastly improved over those of the first generation: a hard disk that, at last, provides popularly priced storage for decent-size — megabyte — files; a vast amount of random-access memory — several hundred kilobytes — to aid the functionality of OS controls; 16-bit technology — edging rapidly into 32 — for speedier calculations; a wide selection of I/O devices for special needs; better-than-ever software to increase personal productivity; and, of course, communications facilities to allow terminal access to larger machines.

To sum up, those users and DPers given to overstatements or understatements should moderate their views toward personal computers and accept the fact that personal computers represent only another set of options available for the organizationwide automated information system. Nothing less and nothing more. ‡

Bilingualism and the law

READER'S PLATFORM

ROY N. FREED

A serious language barrier separates many lawyers and computer executives without their ever being aware of that fact or of its adverse impact on many lawyers' clients.

Lawyers are making the great mistake of aping the language of the industry, usually without knowing that it is inapplicable to them, except as they are customers in the marketplace. In handling legal matters, they talk "computerese"—either to appear knowledgeable or because they don't know any better. In doing so, they shirk their professional responsibilities to their clients. Their clients talk computerese to them, not realizing how their valuable legal interests suffer in the process.

Consider in this regard the following actual, but camouflaged, example. In the acquisition agreement for an important transaction between a developer and a large manufacturer involving a novel, plug-in printed-circuit board and a related software program, a lawyer in a major Chicago law firm defined the term "product" to mean both the board and the magnetic diskette and related other material for the program. He then provided that the developer would deliver the product for evaluation and that the manufacturer had an option to buy the product if it liked it. He failed to recognize that, while his client needed these tangible things in order to assess the marketability of the product, the client would have to buy the know-how and copyrights in the diskettes and written materials in order to have the right to make and sell the product.

The lawyer was taken in by the way his client described the transaction. In the process, he failed to protect his client. His elegant agreement, actually based on a real estate form, would not have gotten for his client the very property rights intended to be secured for the high price if the seller's more sophisticated lawyer didn't pick up the fundamental flaw. This is not an isolated example.

Valuable properties

The valuable properties of many software houses and computer manufacturers will continue to be in jeopardy until their lawyers and executives become bilingual in their

VIEWPOINT

QUALITY from page 31

that requirement. In other words, can it be reliably tested?

The requirements document is the most critical user document produced. As such, it must be the final source of what the system must do. And, of course, it must be under stringent change control.

Finally, the user, project manager and information services management must all agree that this step is critical and not just a necessary evil before we can start programming.

If the required cultural changes can take place in this area, then an organization can begin to take advantage of the true productivity benefits associated with delivering systems and data that do the job right the first time.

The second roadblock is due largely to a failure on the part of information services (with a notable lack of help from the quality group, if one even exists) to quantify clearly in dollars and cents the very real, tangible and direct costs of quality in a data processing organization.

Three components

Quality costs can be thought of as consisting of three components:

- *Prevention.* The cost associated with establishing an environment that reduces the likelihood of flaws being introduced into a system, such as training and standards.
- *Appraisal.* The cost associated with identifying flaws during the process, such as reviews and testing.
- *Failure.* The cost associated with both internal and external systems failure, such as rework and lost business.

Failure costs are, by far, the largest of the three.

Very few managers understand this equation, nor do they fully understand the "physics" of building reliable software. It is becoming increasingly clear when one examines the wealth of data and experiences on systems development that application development projects fall into several broad classifications that exhibit similar characteristics.

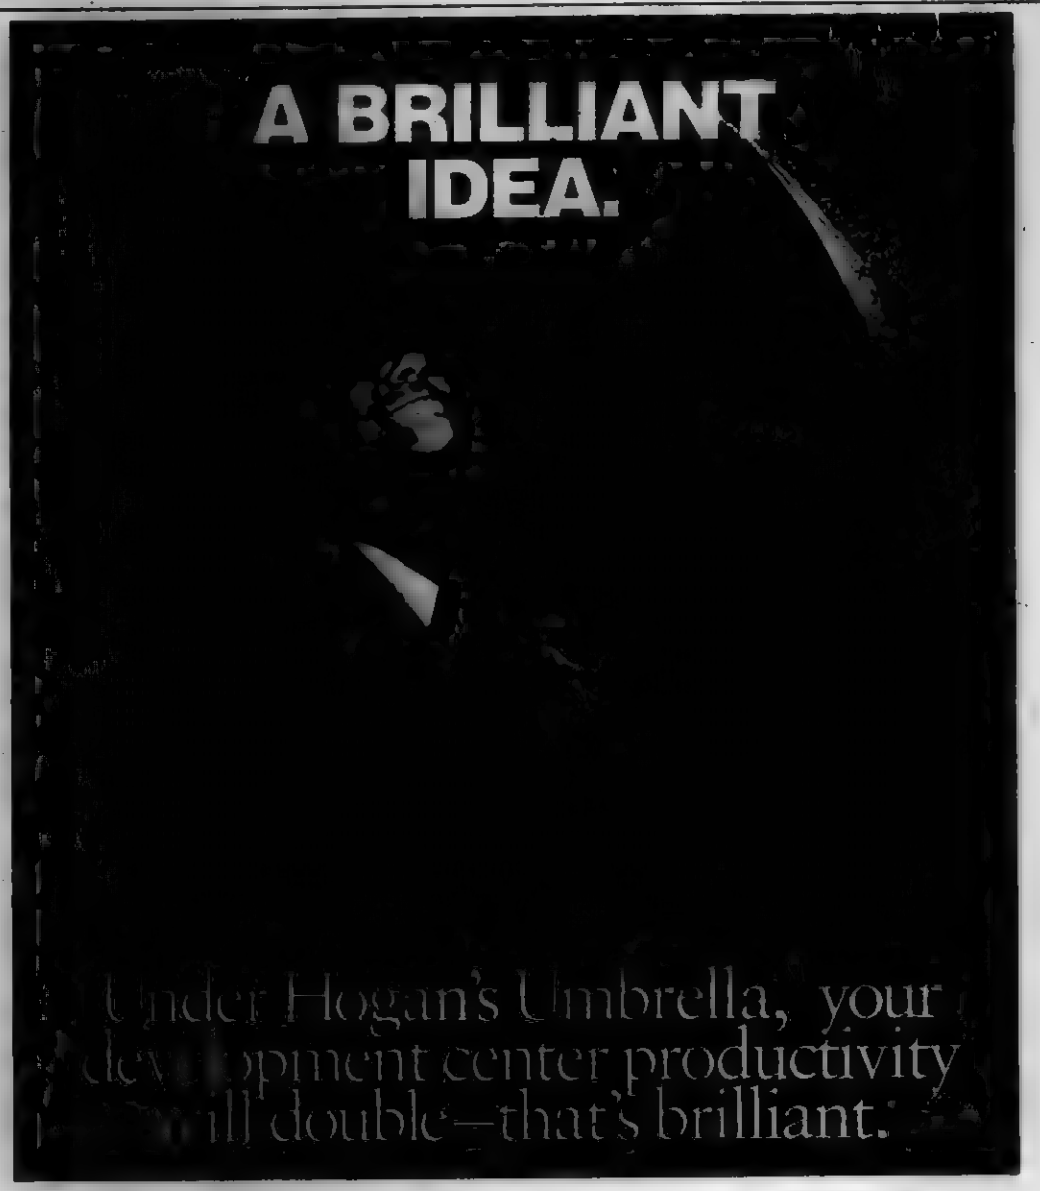
Furthermore, there are built-in causal relationships that can be exploited. For example, if one wants to control a particular dimension of a development effort, then one must have a disciplined control system for monitoring, measuring and reporting on that dimension. The typical dimensions are: time, cost, functional scope and user satisfaction. Another, by now almost classic, characteristic is that defects are exponentially more expensive to correct as the life cycle advances or that time, cost and functionality (even as rudimentarily measured by means of lines of code) define a feasible (and a corresponding unfeasible) region for project success. Further, these relationships are valid for most of what we refer to as maintenance efforts as well as for development.

Yet, there are hundreds of information services groups that every day start high-risk, high-user-expectation projects with no control systems, minimal disciplines and no true user or management commitment — projects that the "physics" would predict are going to be unsuccessful, high-cost, never-ending projects that won't fully meet the needs of the organization in any event.

To help companies compute the costs of quality related to information services, Guide, the IBM user organization, has established what may well be the single most significant effort related to quality costs in the industry via its recent Cost-of-Quality project. The results of this effort will be a substantial step toward not only changing senior management's beliefs and opinions regarding quality, but also in providing a process whereby quality costs can become an inherent and quantitative part of management's planning and decision making.

Quality is not only within our reach but, in many cases, well within our current capabilities. Further, quality data processing may be the best way for organizations to maintain (or even to raise) their profit margins without raising their prices. A quick assessment of failure costs in data processing can often uncover startling opportunities for cost reduction and profit improvement, to say nothing of improving customer relations and increasing business opportunities. The industry has matured now to the point where commitments to a quality information services organization are not only appropriate, but are essential if information services is to play any significant role in company management, direction and performance. ‡

Smith is president, specializing in quality, at Applied Information Development, Inc. in Oak Brook, Ill.



Imagine. A fully integrated development center system capable of upgrading and increasing output throughout the life cycle of both major and minor on-line and batch applications.

This completely automated approach to interactive development was critical in the development of our own highly successful line of applications software. That included design, management, programming, implementation, and maintenance of both on-line and batch applications. The Umbrella weathered well.

So well, in fact, users tell us that, "we beat our estimates by 50% on our very first major on-line application and that included our education time on the Umbrella."

There's a lot more the Hogan Umbrella can do. Just ask any Umbrella user...various combinations of DOS, VS, MVS, IMS, VSAM, CICS, IDMS. And ask Ed Lomax, Vice President, at (214) 386-0020. Make a brilliant decision today.

Send me more information on your UMBRELLA System.

A sure cure for the problem of information bottleneck.

Programming backlog is the source of the problem. Eliminate it, and you eliminate the bottleneck.

Which is precisely what Sperry has done with the MAPPER™ System.

With MAPPER, you work with the computer directly. You ask questions in plain English. And you get immediate answers.

And if the information you get raises other questions, you can ask them right away. With no delay for programming. Or reprogramming.

MAPPER is that powerful. It allows you to manipulate information in almost any way you want. And, interesting to note, it can even help your programmers become more productive.

AN AFFORDABLE SYSTEM.

You don't have to be a large company to have a MAPPER System. MAPPER can be scaled to the real and present needs of just about any size company. The cost of a MAPPER System makes it practical for even a department within a company to own its own system. Or you can time-share through a Sperry service bureau.

What you get for your money is a whole new order of efficiency in your day-to-day management tasks. Because you'll have the information you need right at your fingertips. Literally.

SEEING IS BELIEVING.

We've made some promises here that may sound extravagant. But if anything, our claims are on the conservative side. And to prove it, we offer you the opportunity to see a demonstration of MAPPER at work.

800-547-8362

But first, you might want to look over our MAPPER brochure. A copy is yours for the asking. Call toll-Free: 800-547-8362 (9 a.m. to 5 p.m. E.S.T.). Or send us the coupon.

VIEWPOINT

All I wanted was to buy a bag of groceries

READER'S PLATFORM

TERRI J. STEICHEN

The other day I wrote out a check to pay for groceries. The clerk told me, while looking over my check, that in the near future, the store was starting a new computerized check-approval system. I would have to make a new application if I wanted to keep paying for food with a check.

After over five years of biweekly or triweekly visits to this particular store, I didn't understand why I had to make out a brand-new application. But curious, I asked for a blank application.

The old system simply kept track of bad checks. If a person wanted to continue to cash checks, he had better not write checks he couldn't cover. It was simple. Apparently, it was too simple.

New form

The new application form demanded that I tell them my social security number (are they going to attach my old-age pension?), my drivers license number (which is the same), how old and fat I am, who is silly enough to employ me and where that silly employer does business — all of that in addition to the normal address and phone numbers.

Why, I asked, did I have to give out all this information just to continue to buy groceries as I have been doing for five years? "Because the old system didn't work well enough," the manager explained. I persisted a bit, though the manager looked increasingly uneasy and exasperated. "But why pick on me? I've never written a bad check!"

"You don't seem to understand," he said (this phrase became pretty familiar the more I pursued the matter). "The old system let too many bad check writers write bad checks."

New check approval

Now that, of course, makes sense. Because of the normal float and other delays, unscrupulous or careless people can go on for a long time before their bad check records catch up with them. I'm sure that the new computerized check approval system will be more effective at catching bad checks than the old one was. All that data about how old and fat I am could be useful in tracking me down, if need be. And to store and retrieve that extra information only takes a few more fields on the computer record — pretty trivial, from the technical standpoint.

There is only one problem. It takes me — a person with an unblemished record of trustworthiness (at least from the standpoint of my checking account) — and dumps me into a pot with the worst thieves in the country. For the store's ease of screening out crooks, I am presumed to be a crook until proven otherwise. That's just fine for the store and for the data processing processors. But what about me?

I don't like the mistrust and presumption of guilt that seems to come with so many computerized applications. Why does a store clerk have to presume every customer is in the credit companies' bad-credit listing, forcing me and all the other customers to wait while the clerk proves that is not so? In my case, I could have told him so if only he had asked me.

America is the world's great melting pot. That's a great concept because it means that we take the best the rest of the world has to offer, put it all together and come out with something even better — or that's what I thought it meant. But with the way that businesses are computerizing that melting pot, it seems as though something is changing, something quite important.

That's not logical, I know. It won't compute. But it bothers me. ‡

Steichen is president of New Perspectives Group, Ltd., a consulting firm based in Fairfax, Va.

respective languages. The property interests involved, although entirely traditional, are new to most lawyers, and they are prevented from recognizing those interests by the shorthand terms computer people have adopted for business purposes.

Being intellectual property rights, such as copyrights, trade-secret rights and patents, those interests are extremely fragile. They can be lost forever if they are not established firmly at their very inception. Lawyers and computer people, who ordinarily speak entirely different languages, simply must start communicating with each other effectively.

Out of pure self-protection, computer executives have to learn the types of properties their companies are involved with. They have to think in terms of copyrights, trade-secret rights and patents — the intellectual property rights. Tangible items reflect things in which those rights exist, being information in the case of patents and trade-secret rights, and ways of setting forth information in the case of copyrights. They are not necessarily the real subject matter of many transactions. Permissions to enjoy intellectual property rights owned by others are granted, and received, by licenses. With that knowledge, executives can guide their lawyers in designing transactions, or at least not divert them.

The word 'software'

Take the word "software," used as a noun, as another example. While business people usually are understood by their peers when they speak of "selling software," lawyers need more specific characterizations of the possible transactions in order to advise their clients correctly on tax liabilities, liability exposures and property interests. The rules of law in those and other areas are divided into many categories that have different qualities and consequences. Most of those categories continue to be applicable in the computer age. Sales taxes apply to transactions whose principal purpose is the transfer of tangible personal property at retail, such as the outright sale of a prerecorded diskette for a microcomputer program; they should not cover licenses to use trade-secret information about software programs until the legislatures so provide. Tangible personal property taxes apply to the ownership of that property, but not to a license to use such information. Similarly, the federal investment tax credit applies to tangible personal property but not to intangible property until Congress provides otherwise.

Knowledge of those different qualities is supposed to make it possible to predict legal treatments of actions under various circumstances. Predictability is essential in selecting business policies and designing business arrangements. It is essential in controlling costs of legal services and achieving desired property interests. Lawyers are expected to be able to predict legal treatments in most situations that confront their clients, and they should have the means to do so, largely through understanding the subject matter despite the computerese.

Hence, lawyers have to become proficient in translating from the computerese of "software" to the various intellectual property rights involved in particular situations. When they do, their clients will start to secure the level of legal service for which they are paying right now. ‡

Professional Computer. personal computer And tomorrow.

For your best performance and productivity, rely on the TI Professional Computer.

Critics have called it "the machine IBM should have designed." And "the optimum personal computer." And thousands of demanding business and professional people have had similar praise for the design, software availability and dependability of the Texas Instruments Professional Computer. Here's why.

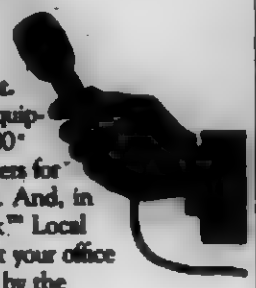
Best internal design.
With the TI Professional Computer, you avoid the possibility of computer underbuy or overbuy. Unlike IBM, our standard PC can grow to XT capability — so you don't have to choose between a PC or an XT. If you need more computer after you buy the standard TI Professional Computer, add features like internal memory up to 768K RAM. And internal 10 megabyte Winchester disk. Or other expansion capabilities which you can add using our 5 built-in option slots. So you get more computer without buying a new one.

Best graphics.
Our high resolution monitors give you some of the sharpest displays available, 3-plane graphics and the capability for 8 simultaneous colors or monochrome shades (IBM and Apple give you only 4). Plus, unlike IBM, the same software runs on either the color or monochrome monitor.

Best software available today.
Literally hundreds of third-party software packages are available for the TI Professional Computer. Including the best-sellers like Lotus 1-2-3™. TI and leading third-party software suppliers are committed to developing new programs to help keep your business ahead.

Best keyboard.
Superior design makes this the easiest to use keyboard. You get 12 programmable function keys for faster, easier use. Separate numeric keypad and cursor controls. And isolated edit/delete keys to prevent accidental loss of data.

Best new features for the future.
Come in to a participating dealer today for a demonstration of the TI Professional Computer using our revolutionary speech recognition† capability. Soon you will be able to add the recently announced Speech Command™ option to the TI Professional Computer. This will enable you to operate the computer with simple voice commands. Which lets you work a lot faster and easier.



Best support equipment.
We offer companion equipment like the OMNI 800* Model 850 and 855 printers for reliable hard copy output. And, in early 1984, the EtherLink.™ Local Area Network to connect your office workstations. All backed by the TI worldwide network of service and support.

See the TI Professional Computer for yourself. It is, quite simply, the best. Today and tomorrow. Now at participating ComputerLand stores and independent dealers. For the location nearest you, and answers to questions about your computing needs, call 1-800-527-3500.

TEXAS INSTRUMENTS

Know why retailers everywhere are getting knoware™ fast?

Knoware™

- Teaches how to use a personal computer—in no time.
- Includes software programs that can be used—all the time.
- Makes personal computer learning enjoyable.
- Makes personal computer learning easy.
- Is a tool to be used at work or at home.

Available on Apple® II + and IIe, 64k. IBM® PC and XT, DOS 1.1 or 2.0, 128k, color graphics.

KNOWARE

301 Vassar Street, Cambridge, MA 02139

Knoware is a must for retailers because it

- provides personal computer education PLUS eight usable applications—all for $95 retail.
- helps sell hardware by letting PC buyers prove to themselves the benefits of personal computing and by letting them succeed on the first try.
- helps sell more software by providing a conceptual understanding of the benefits of best-selling applications software.
- means customer satisfaction by eliminating the frustration many new users feel once they get their personal computers home.
- is a terrific tool to train your salespeople. Knoware gets them up-to-speed quickly with personal computers. At the same time, customers can actually get themselves started on a personal computer, freeing up your staff to handle more sales opportunities.

Knoware supports dealers with

- special in-store demo copies of Knoware.
- point of sale materials.
- toll-free dealer phone line to Knoware.

Knoware will continue to capture the public's attention with

- a major advertising and promotion program.
- the introduction of a family of products, including education on programming languages and best-selling applications, such as word processing, electronic spreadsheet and database.

Know who you have to contact to get Knoware fast?

Alleviating backlog

Normalization technique a solution

By Joseph Tassone
Special to CW

The applications backlog, which averages 2½ years across the industry, has spawned the development of hundreds of new software products recently. Experts agree there are two ways to alleviate the problem. One is to increase the efficiency of DP professionals. The second is to provide end users with the capability of fulfilling their own requests. Either course requires that a manageable data storage and structure technique be provided.

Ideally, this technique would result in data arranged in the same logical and ordered format as it was prior to computerization, somewhat like a filing cabinet, but without the duplication of data across different departments.

This simple format is commonly referred to as a normalized data structure. Normalization is the process of unbundling and decomposing data to reflect logical information requirements.

Data base management systems (DBMS) are now expected to do more than merely store and control data. They are expected to provide a simple yet efficient means to fulfill information requirements. As a result, relational technology has received wide acceptance. So has the idea that data should be broken down and stored in a more fundamental form, whereby elemental data values can be utilized in a data base designed for greater flexibility. This is normalization.

In its simplest form, normalization is the process of structuring data so that it reflects the information requirements of the company and is never duplicated. Normalization cannot make conventional DBMS easier to use if navigational requirements are placed on the user or programmer. In a relational DBMS, the tabular files are navigated by the system itself. Normalization is ideally suited to relational data bases.

Normalization eliminates duplication of data, retains the logical relationships and

'Monitor' update out for CICS

Landmark Systems Corp. has announced Release 6.0 of its Monitor performance monitor and reporting system for users of IBM's CICS Release 1.5 and higher in IBM DOS/VSE, VS1 and MVS environments.

According to Landmark, the new release features an Activity Data Collection facility that captures all transaction-level resource utilization information on a high-performance Vsam data set. Advanced file design is said to ensure high performance and flexibility, and batch facilities are also provided, including a report writer plus a bridge which allows translation of Monitor data into IBM's Performance Analyzer II format.

The Online History Review is said to allow graphic or detail replay of CICS events and performance for any part of the day. A selection facility allows the user to look at the activity for specific transactions, programs, terminals and time periods. The package's Supertrace feature reportedly provides a selective, on-line transaction and system tracing capability that aids in tuning applications or in problem determination.

Features file analysis

Release 6.0 also features File Analysis, which gathers performance information for each file and DL/1 data base access and provides an on-line display of activity by channel, control unit, volume or file. An Extended Task Analysis facility allows on-line analysis of problem events.

The permanent license fee for Release 6.0 of the Monitor for CICS is $13,500 for the VS1 and MVS environments and $6,500 for the DOS/VSE environment, according to a spokesman for the vendor.

Landmark Systems, 4701 Upland Drive, Alexandria, Va. 22310.

Ada nearly ready for IBM micro

SOFTALK

PAUL GILLIN

In this age of the microprocessor, it seems nothing is legitimate unless you can run it on your IBM Personal Computer. The Ada programming language is no exception.

Alsys, Inc. of Waltham, Mass., plans to give Ada enthusiasts that capability later this year with two validated compilers for Intel Corp. 8086-based and Motorola, Inc. 68000-based microcomputers. The company will also offer a line of computer-assisted instruction software and videotapes and a set of canned Ada routines that businesses can buy rather than build themselves.

Cramming the technically rich Ada language into a micro has presented problems, according to Charles C. Patrick, Alsys' vice-president of marketing. "Developers have pretty uniformly had difficulties with compile times," he admitted. "But we're expecting to learn a lot from running and improving the compiler. We also expect hardware to continue making breakthroughs."

What is most interesting about Alsys' plan is its approach to portability. A key strength of Ada, which was commissioned by the U.S. Department of Defense (DOD) for military applications, is standardization. In order to bear the Ada name, a compiler must undergo a rigorous series of DOD-administered tests that involve running over 2,000 Ada programs. In theory, any Ada program should run on any Ada compiler.

Alsys hopes to overcome the issue of machine incompatibility by creating a "root" or front-end compiler that makes up about 80% of the total compiler code. Individual vendors can license the root, which is called Alsykit, and add the other 20% to customize the software to their own machines.

Alsys said that Alsykit can save a customer two-thirds of the cost and 80% of the time required to develop a validat-

Figure E

In the normalized data structures shown here, Figure B contains customer number, name, address, city, state, Zip Code where customer number is the key; Figure C contains customer number and policy number where customer number is the key; Figure D contains policy number, policy type, billing date, billing amount and where policy number is the key; and Figure E contains city and policy type and sales code where a composite key city/type is the key. In Figure E, since the salesman is functionally dependent on policy type in each city, a composite key is used.

CUSTOMER NUMBER	POLICY NUMBER
100	28755
100	14590
100	29800
200	12532

Figure C

DATA from page 37

stores the data in clusters of related values. Each of these clusters is identified or accessed by means of a key. The key value is used to locate all other related data.

Pyramided, maintained

Normalizing data does not mean that information processing throughout the data center has to be shut down to accommodate some exotic transformation process. Like a diet, it should be practiced and maintained for maximum effectiveness.

The steps involved in achieving normalized data are defined as levels or "normal forms." They are representations of the logical progressions required to reorganize the data. However, data does not have to proceed in a step-by-step order. It can be directly transformed from an unnormalized state to a normalized state. The third normal form is a tremendous benefit. It is more manageable, easier to access and more meaningful for users.

The most important rule of normalization is that every field (domain/column) within a record (tuple/row) is either part of the key or provides information about the key and only the key.

The unnormalized file in Figure A contains a string of related information. In conventional file structures, data was organized in long strings associated with specific applications. There was little thought of multiple uses of each piece of data.

Using this unnormalized file, the system would have to transfer each record in its entirety into main storage to process it, a very I/O-intensive procedure. Every application that requires a single component of the record must process the complete record.

To normalize the data, four separate files should be created (see charts).

Using normalized data, access of information is more efficient. Only the necessary information, related in significantly smaller blocks, is transferred, and the I/O rate is substantially decreased.

Normalized data model

The guidelines to follow to reach this normalized data model are:

- Decompose the data into its simplest form.
- Natural values in the fields can be different, but they must be the same type, such as fixed length.
- Only include logically related data within a single file.
- Use key data fields to identify non-key data fields.
- Be certain that all data within a file points to the key.
- Each field must provide only a single-valued fact about the key.
- Be certain that data fields are functionally dependent only on the key.

Toscano is a systems programmer specializing in CA-Universe, a relational DBMS, at Computer Associates International, Inc.

ELRON TECHNOLOGIES, INC.

אלרון מוגשיה אלקטרוניה בע"מ

The Venture Capital Arms of ELRON ELECTRONIC INDUSTRIES LTD. an ISRAELI hi-tech holding company is interested in financing and supporting new high-technology ventures in Israel, or in the U.S. with a branch in Israel.

ELRON offers:

- Support at the initiation stage in the U.S. and Israel
- Assistance in the development of business strategies and business plan
- Assistance in personnel recruiting The Elron group includes these companies: Elisra, Elscint, Fibronics, Optrotech, Zoran, Bio-Technology General.

ADDERS/Data Entry BEATS ALL OTHER DATA ENTRY SYSTEMS

ON SIMPLICITY, FUNCTIONALITY, AND COST

Simplicity : ADDERS/Data Entry runs on existing terminals under SHADOW II or CICS in pseudo-conversational mode. Non-D.P. staff can set up their own input screens to mirror source documents. No additional hardware needed!

Functionality : ADDERS/Data Entry offers all the function of the best key-to-disk systems plus on-line power and direct data entry.

Cost : ADDERS/Data Entry protects your resources by removing the need for specialized hardware and making optimum use of your mainframe power.

ADDERS/Data Entry is one of a group of integrated products that make common use of the **ADDERS** nucleus.

Call: 1 (800) 556-7845 now for a free trial.
Your payback can start in just three months.

Boston, MA 02109 • (617) 367-9180

The Solution.

Dial-Up 3270

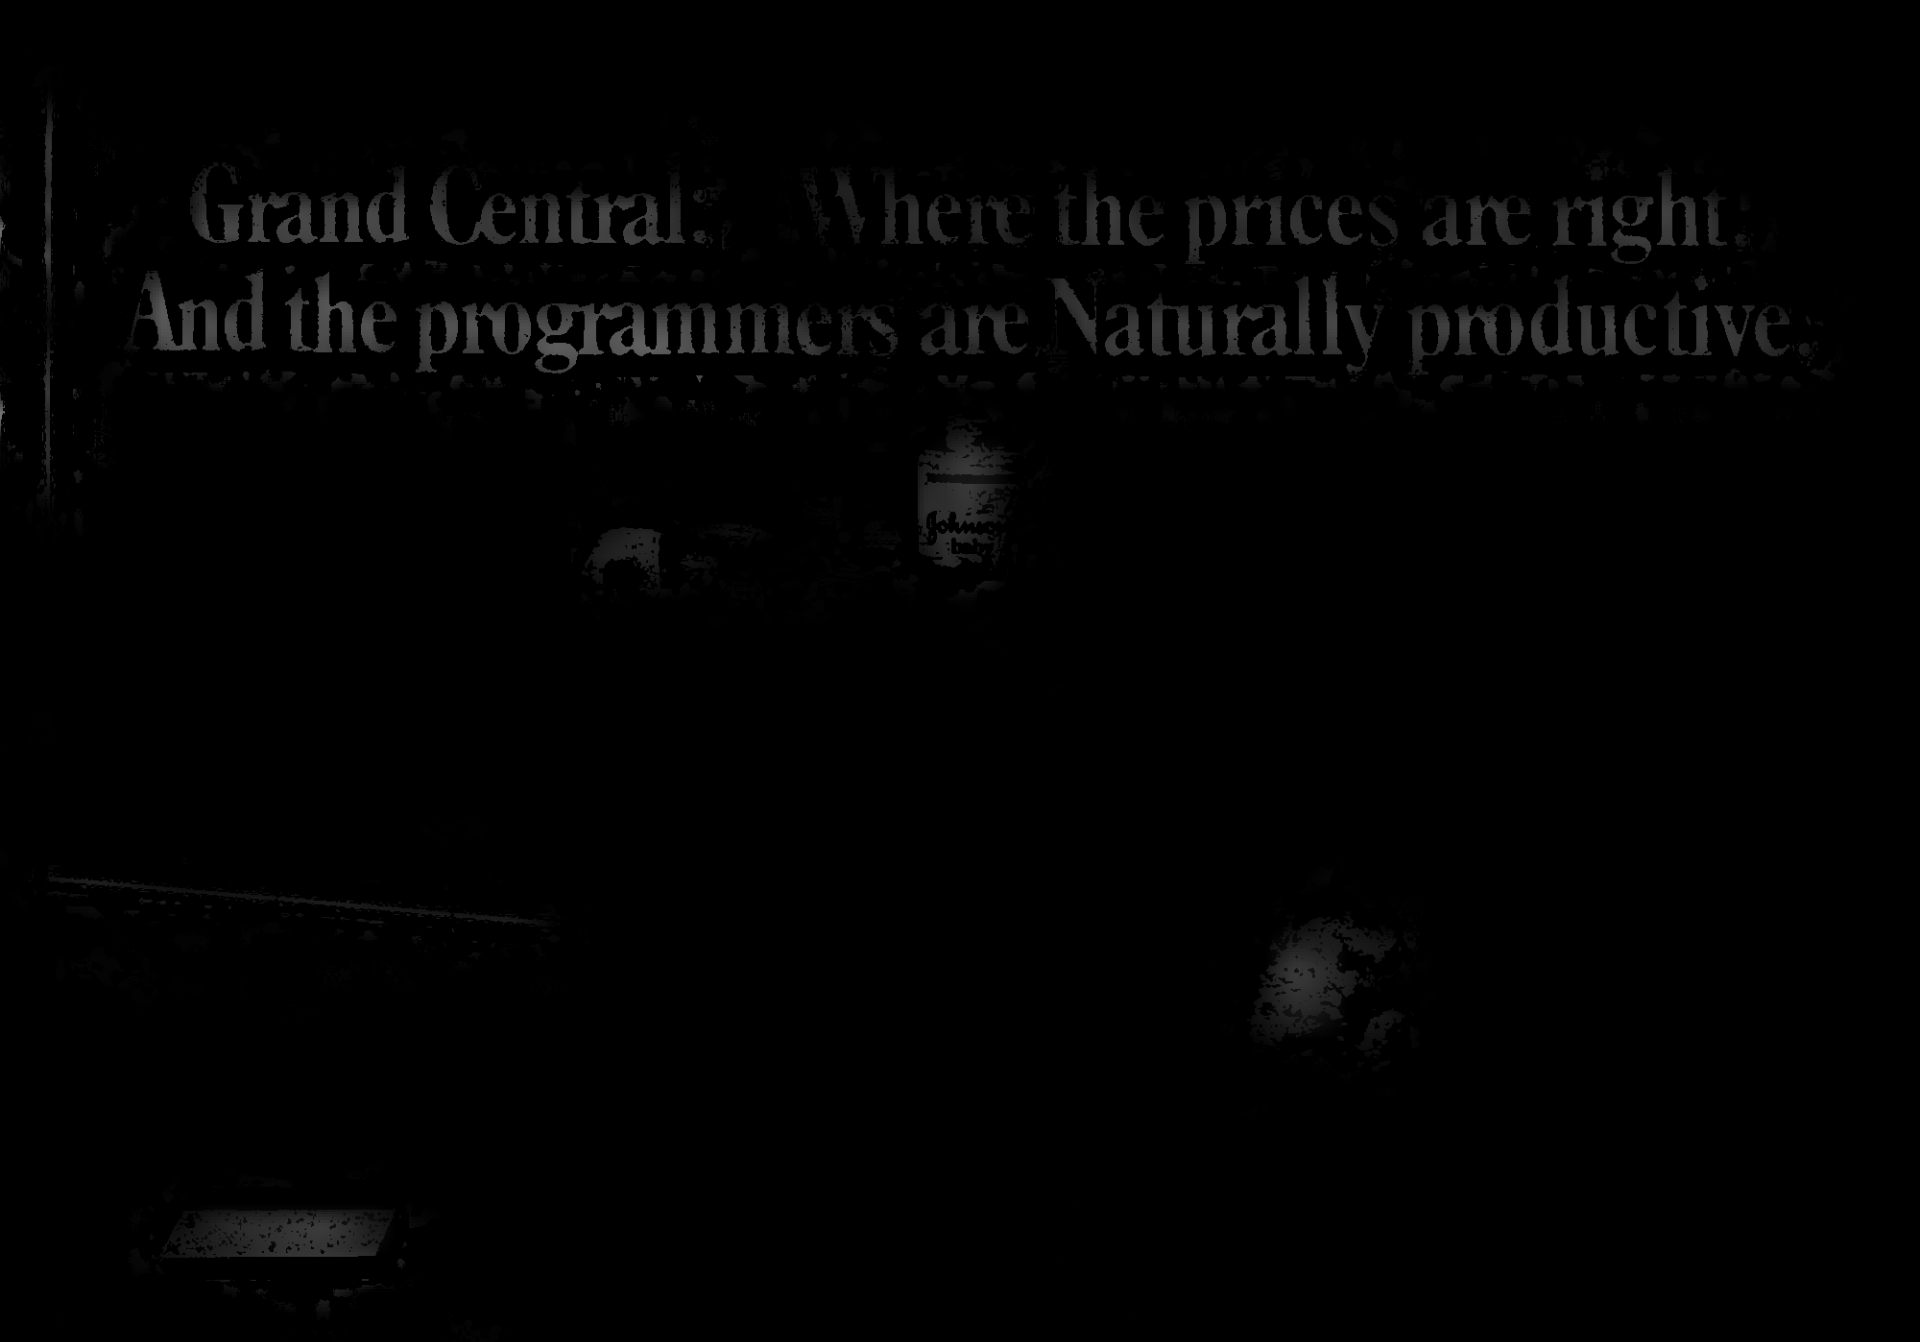
LineMaster An intelligent device for dial-in access to your mainframe 3270 Bisync line. **LineMaster** is a communications watchdog which keeps a line in service until a user dials in.

- For any remote 3271/4/6 line—up to 19.2K baud.
- Compatible with any 3270 BiSync emulator including microcomputers.
- Connects between modem and mainframe.
- Installs in minutes.

$639.

MicroFrame, Inc.
205 Livingston Avenue
New Brunswick, NJ 08901
(201) 828-4499

Grand Central: Where the prices are right.
And the programmers are Naturally productive.



Micro-to-mainframe:

Before you settle for solution, ask a few serious

Choosing a micro-to-mainframe communications system is no game.

If you make the wrong choice, the consequences can be very expensive.

So before you toy around with "easy" solutions, do yourself a favor and ask some serious questions.

You might want to start with these:

Will this product support full IBM Terminal Emulation?

Make sure the system you choose offers *full* protocol emulation. It should be able to emulate remote batch and interactive IBM terminals and terminal systems.

Does the company offer a variety of products to solve my problem?

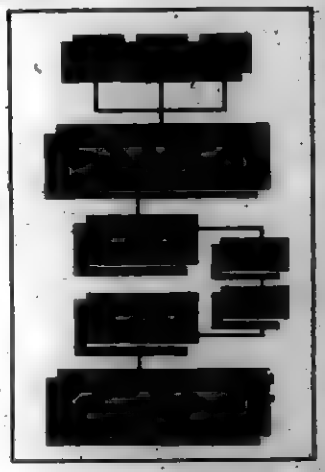
The manufacturer you select should be able to handle *any* operating environment. You should have your choice of stand-alone front-end processors, IBM PC or XT boards, or an OEM board. And make sure the products will run on the most popular operating systems, including CP/M, MS-DOS and UNIX.

Can I get fast answers to my questions?

Insist on toll-free access to qualified service personnel before and *after* the sale. A Product Support Group should be available during your normal business day.

What if I need a quick analysis of a problem?

If you run into a problem, you shouldn't have to sit through a lengthy question-and-answer session over the phone. Ask if the manufacturer has a Communications Test Center that allows for product testing over public phone lines. And find out if the product has internal diagnostics that point out problem areas right on the screen.



Suppose something goes wrong with the unit?

Be sure the company offers a service plan that includes a 30 day money-back guarantee and a 12 month warranty that includes a free replacement unit.

a simplistic questions.

What about future product development?

It's not enough for a company to solve your communications problems today. Ask about their commitment to R&D. Are they working on products you're going to need soon? If not, you might want to consider someone who is.

Who am I dealing with anyway?

In a market as volatile as this one, you need some reassurance that the people you buy from will be around to back up their products. Ask how long they've been in business. The longer, the better.

How much is all this going to cost?

There are lots of micro-to-mainframe solutions with lots of price tags. But here's a point of reference for you:

Our own DataTalker™ product line will give you all the capabilities and services we've just described for as little as $695. Complete.

Granted, this isn't all the information you'll need to choose the right micro-to-mainframe solution. But it's a good start.

If you'd like to know more—and there certainly is more to tell—contact our Marketing Support Group at 1-800-321-7795.

We'll make sure you get the answers you need. And we won't play games.

DataTalker™

By Winterhalter, Incorporated

Winterhalter, Incorporated has been providing data communications solutions to major manufacturers of microcomputers and word processors since 1978. Our DataTalker front-end processors and PC boards are used by companies around the world, from start-up manufacturers to the Fortune 1000.

NASDAQ SYMBOL WNTL

SOFTWARE & SERVICES

SYSTEMS SOFTWARE

SOFTSYSTEMS, INC.
Security system

Softsystems, Inc. has announced its on-line security system for IBM CICS terminals and operators.

The system controls CICS access by operator and individual terminal, according to the vendor. For example, a CICS terminal in a payroll department cannot be accessed by a CICS operator in another department.

The security system consists of six modules: security manager, operator security, terminal security, conversion, initialization and terminal session module.

The system runs on CICS/VS Releases 1.4, 1.4.1 and 1.5. A one-time installation charge of $1,200 includes an installation tape, installation and system guide, security administration guide and one year of maintenance. The annual maintenance fee is $120.

Softsystems, 311 Mallick Tower, One Summit Ave., Fort Worth, Texas 76102.

MICHAELS, ROSS & COLE LTD.
MRC-Dictionary Release 2.0

Michaels, Ross and Cole Ltd. has announced an enhanced version of its MRC-Dictionary, a data dictionary designed to allow nontechnical users to employ relational data base management capabilities on the IBM System/38.

MRC-Dictionary Release 2.0 reportedly helps to drive other MRC-Query series modules, including MRC-Maintainer. The release is said to offer additional and faster editing capabilities as an adjunct to the System/38 data description specifications.

The dictionary module is priced at $1,140.

Michaels, Ross & Cole, Suite 501, 1301 W. 22nd St., Oak Brook, Ill. 60521.

PRODUCTIVITY AIDS

DATAMETRICS SYSTEM CORP.
Torch/PMS

Datametrics System Corp. has announced Torch/PMS, a performance management system for Sperry Corp. 1100 computers.

Torch/PMS helps identify and correct performance bottlenecks in early stages, the vendor claimed. It reportedly highlights work load and utilization trends for capacity planning and model building and is useful when collecting data needed for new equipment justification. More than 100 scatter plot diagrams are included with the package, the vendor said.

Installation and one year of software maintenance support are included in the initial lease of Torch/PMS, which is priced at $22,500.

The package comes with documentation, a one-year warranty, one day of on-site training, a plot interpretation handbook and one performance analysis study of the customer site.

Continued maintenance and support is available for $2,000 per year, beginning in the second year.

Datametrics System, Suite 201, 9940 Main St., Fairfax, Va. 22031.

IVAN SOFTWARE, INC.
Ivan-Lib/Ivan-Edit Release 3

Ivan Software, Inc. has announced Release 3 of its Ivan-Lib/Ivan-Edit software, designed to reduce program development time and increase programmer productivity.

Release 3 features Interactive Ivan Command Language and interactive utility capability for users of NBC Corp.'s VRX operating system.

The product reportedly allows the programmer to set up an unlimited number of text editing commands in a procedure for subsequent execution. Utilities, either user-written or vendor-supplied, can be set up in an interactive command procedure for execution in seconds.

Prices start at $5,000.

Ivan Software, 190 N. Keowee St., Dayton, Ohio 45402.

ADA from page 37

ed Ada compiler. That is no small task, as the company claimed 50 man-years of development went into the root compiler.

Hardware makers and systems developers can contact Alsys now to acquire Alsykit. The full compiler for the two microprocessors, called Alsycomp, will not be available until the end of the year.

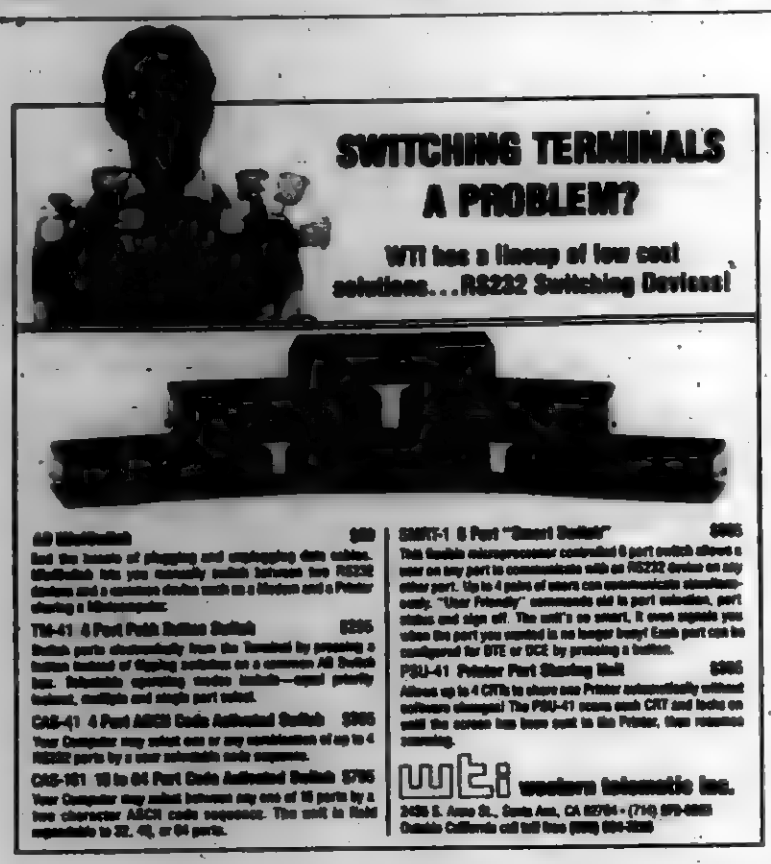
Also on the drawing boards at Alsys is a set of reusable Ada code that can save programmers the hassle of writing their own canned routines. Alsypac is a step toward the "software factory" concept for which Ada has been called the ideal language. Companies will be able to buy the routines they need and store them in a library for use in Ada programs. The routines will become available after the compiler is validated late this spring, Patrick said.

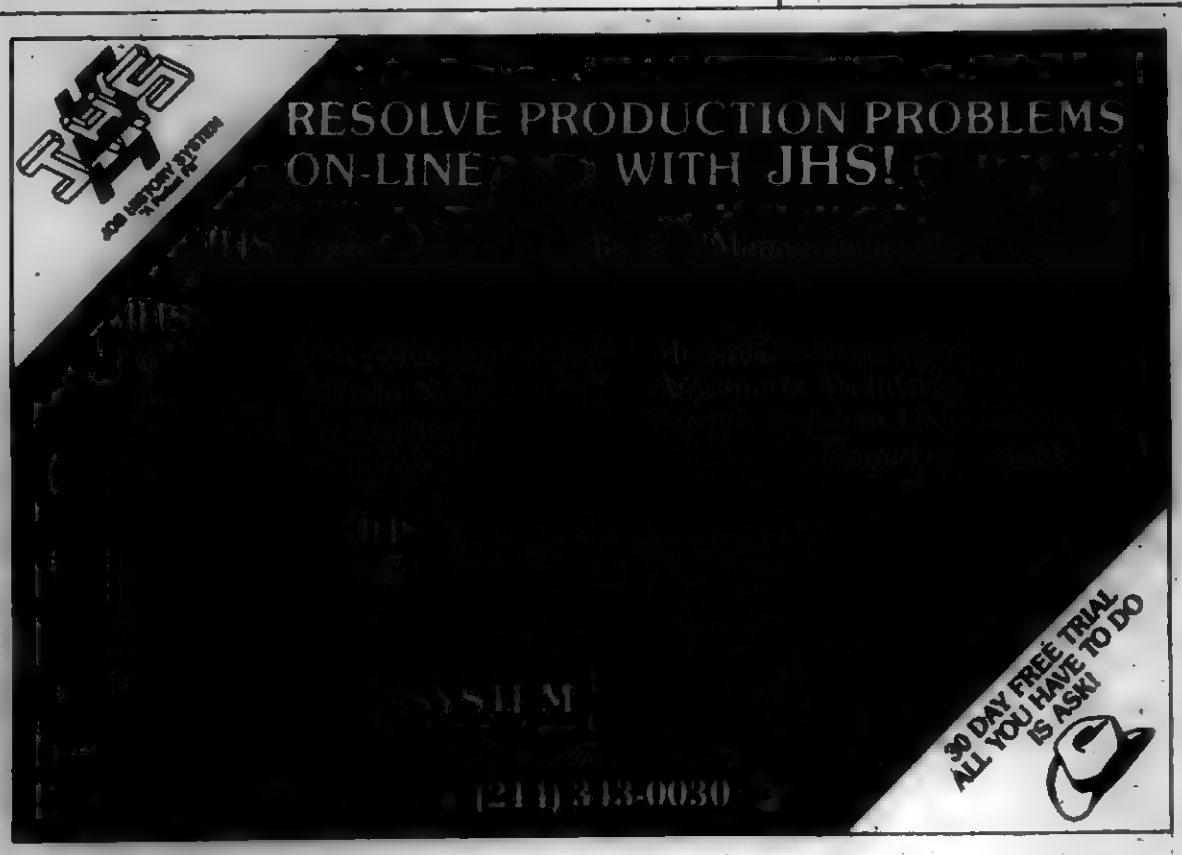
Alsys is betting its bankroll on the possibility that Ada will become one of the dominant programming languages of the 1980s and 1990s. Ada has inspired much controversy since development was undertaken in 1975. Critics say that it is too complex and that the learning curve is too high for Ada to replace Cobol. They also question the wisdom of spending the money to scrap millions of perfectly good business programs around the country in order to achieve the as-yet-unconfirmed benefits of Ada.

However, Ada proponents point to the fact that the language's modularity makes it well-suited for reusability, a factor that becomes more important as application backlogs grow. They also say that Ada's standardization eliminates the problem of maintaining old applications written in obscure languages and eases the burden of training new programmers in the quirks of a particular machine's language implementation.

Softech, Inc. predicted that the Ada market will reach nearly $750 million by 1986. Patrick noted that as many as 300 military projects could be programmed in Ada by that time. Alsys President Roy A. Finney added that, despite the controversy, several dozen books have already been published on Ada.

Alsys and others said the reason so few programmers are using Ada is that so few compilers are available. For that reason, companies like Alsys will be worth watching in the future. "It's such a large market that it's very difficult to quantify," Patrick said.





What three letters represent the most powerful on-line computer in business today?

TX

The most powerful on-line

Time was, the answer to the previous page was as easy as ABC.

But that was yesterday.

Today, the world of business computing is being introduced to a system featuring over two-and-a-half times the performance and twice the price/performance of its nearest competitor.

A versatile system. Able to compile the information of the largest corporations into a single relational data base. Instantaneously updated and fully available across the entire system.

An expandable and compatible system. Allowing the simple addition of future programs and equipment, without sacrificing past investments.

And most importantly, a system that won't let you down. Because its fault-tolerant design won't let itself down. Even if a major component fails.

This system isn't from IBM.

It's from Tandem.

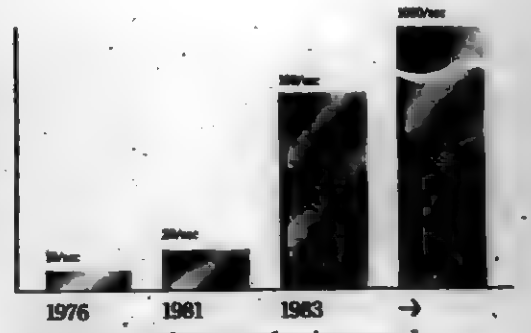
Introducing the NonStop TXP™ system.

TXP: 32-bit transaction processing.

The TXP system processes high volume loads faster and more economically than any other system. Executing over 100 transactions per second now and thousands of transactions in the near future.

It's built around multiple parallel 32-bit processors. Each addressing 16 MB of physical memory and over a gigabyte of virtual memory.

To help memory keep pace with that kind of processing, TXP pulls 64 bits on each memory access.



Our success can be summed up in a second. *Transactions per second. Numbers unsurpassed in the industry. On-line systems that fit your needs today. And tomorrow. With more processing power on the way.*

The TXP system also features parallel data paths. Manipulating 32 bits of information in a single cycle, two 16-bit operations in the same cycle.

And TXP incorporates extensive pipelining, to process multiple instructions simultaneously. Each processor overlaps instructions in three levels: Fetching one, while preprocessing a second, while executing a third.

While helping TXP deliver full 32-bit power, for less.

Cache memory pays off in faster response times.

Cache memory is a high-speed data storage area between the processor and main memory. It lets the processor store more frequently used information closer. So it can get to it faster.

And our tests have shown that the TXP cache memory has a 98% "hit rate." Which means the requested data is virtually always nearby for fast access.

The result? Larger volumes of work can be processed in shorter amounts of time. Helping TXP to be even more productive.

Making cache memory pay big dividends.

A system you'll expand, not disband.

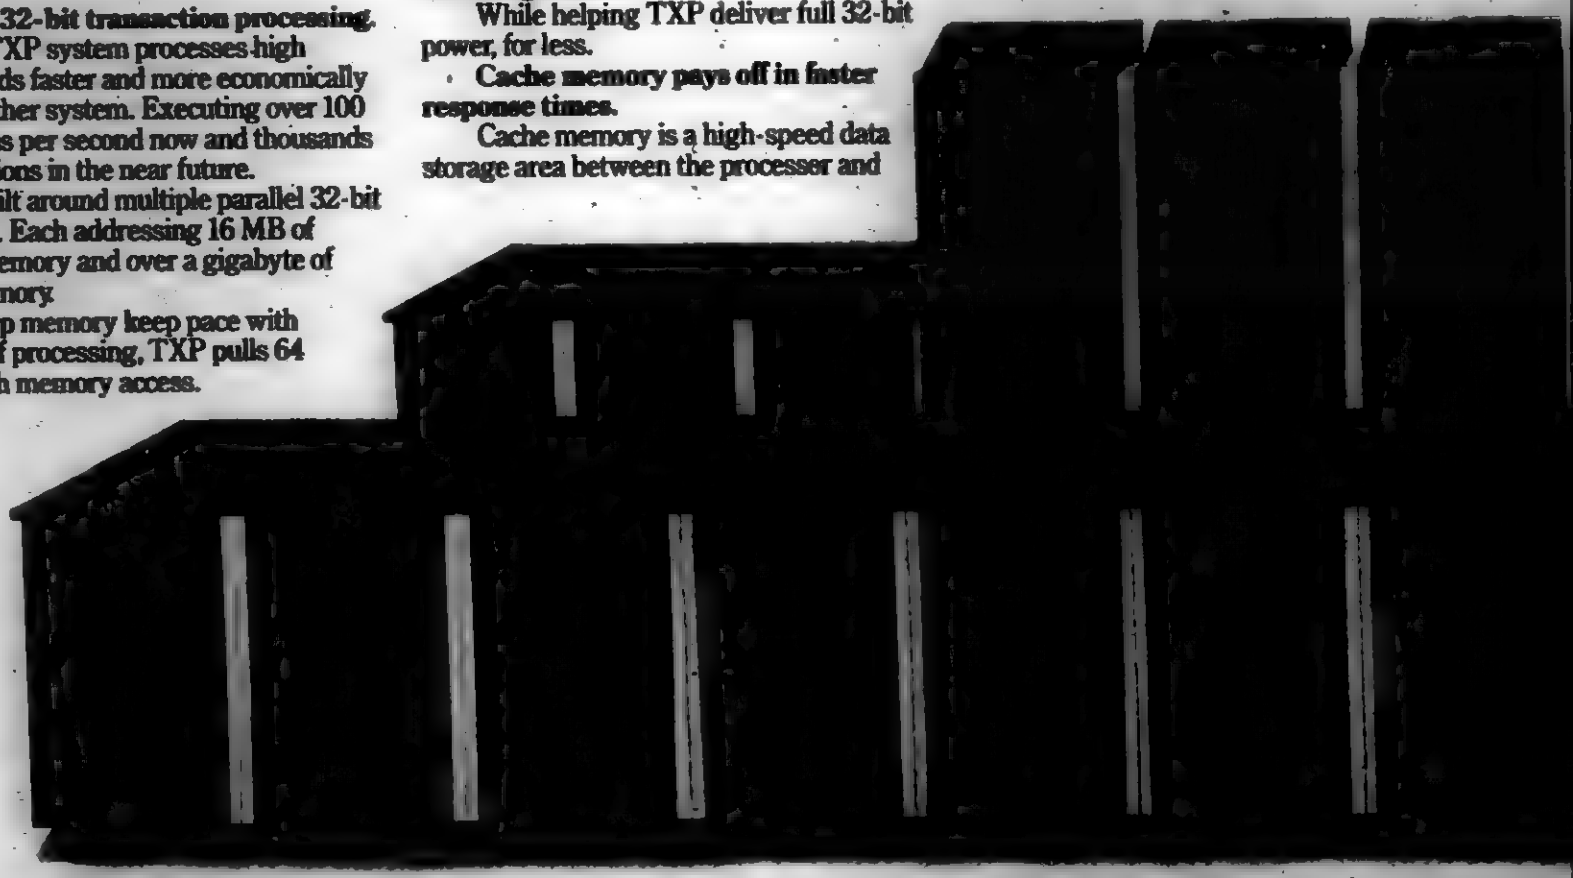
Most computer systems have very limited expandability. So if a company outgrows its computer's capacity, it usually means starting again from scratch.

Selecting and buying a larger and more expensive system.

Then reprogramming.

Then re-training.

Plus all the chaotic disruption and



XP

computer in business today.

massive loss of revenue that's unavoidable during the switch-over.

Not so with the TXP system.

It can expand from two to 16 processors. Increasing its power by a factor of eight.

That's more power than any of the largest mainframes.

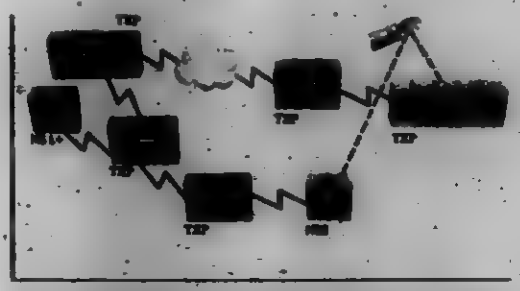
And the additional processors can be installed while TXP is running at full speed. No downtime. No reprogramming.

Still not enough power? Up to 14 TXP systems can be joined together by high-speed fiber optics. Linking the systems together as one computer with 224 processors.

But that still isn't the full potential of the TXP.

TXP systems at up to 255 sites can be joined in a worldwide network. Generating the power of over 4,000 processors.

And that gives TXP the most powerful on-line computer capacity in business.



The most powerful computer network in business today. *Users access a single unified global data base from any of thousands of terminals anywhere in the system.*

Expandability our competition wishes they could disband.

NonStop™ system compatibility from the people who started it all.

TXP can process more information and support more programs, users and devices than any other computer designed for on-line transaction processing.

Devices you most likely already have.

Even devices made by IBM.

But what if your company isn't quite ready for the TXP system's awesome power?

We suggest the Tandem NonStop II™ system. The second most powerful on-line computer in business today. The cost effective solution for medium to large corporations.

What if your company is somewhere between a Nonstop II and a TXP?

No problem. They can be combined. They can share the same data and programs. In fact, NonStop II and TXP processors can coexist in the same cabinets.

And what if your company needs even a smaller computer? We make a smaller computer. The Tandem NonStop 1+ system. Perfect for those low-volume sites where less processing power is needed.

Tandem literally wrote the book on NonStop™ transaction processing. That's because we introduced the first NonStop system.

Over eight years ago.

And for over eight straight years, despite attempts by others, we've continued to lead the industry.

Learn all about TXP, ASAP.

For complete literature, contact your local Tandem Sales Office.

Or write Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014.

Or call us, toll-free. (800) 482-6336.

TXP is the most powerful on-line computer in business today.

Without question.

WE WROTE THE BOOK ON DOCUMENTATION. AND THEN WE THREW IT AWAY.

Communication Sciences introduces Explain. *The system that puts your software documentation where you need it most—online and in your data base.*

With Explain, you can create online user help, training procedures, program documentation and more. Because Explain uses the power of your DBMS, you can maintain the documentation as easily as you do the rest of your business data.

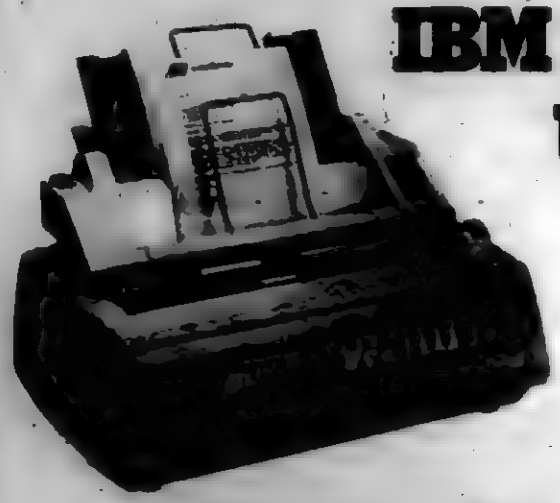
Access to the online documentation is at the user's fingertips. With simple commands, users can retrieve the help they need—directly from any application you link to Explain.

Chosen by Comserv Corporation as the online help system for AMAPS/3000, Explain is a powerful tool for both writers and readers of software documentation. And it's available to users of HP/3000/Image and IBM series. 30xx and 43xx systems.

With Explain, you can afford to throw the books away. And keep the documentation.

For more information: call us at (612) 332-7559, or write to Communication Sciences, Inc., 100 North Seventh Street, Minneapolis, MN 55403.

CSI
Communication Sciences Inc.



IBM 3270 Users:

Better than IBM 5210, the ISI-736 Printer is available now!

Solid Character. Letter Quality

Plug compatible with the 3287 for on-line printing from your IBM system. Optional Twinfeeder automatically feeds letterheads and second sheets selectively from trays under program control. Ideal for IBM CPU-based word processing software. Multiple fonts and separate pitches. Support most languages. Features include: programmable tray selection, underscoring, boldface type, subscripting and super-scripting. And no need to run SNA to use these features!

Call, write or TWX today!

APPLICATION PACKAGES

DECISION SYSTEMS
Worksheet

Decision Systems, a division of Interactive Data Corp., has announced Worksheet, said to be a mainframe reporting and data management system with built-in links to most microcomputer spreadsheet packages.

In addition to its mainframe reporting and data management capabilities, Worksheet enables users to transfer user-defined computations and formats from mainframe to micro with simple key commands, a spokesman said. The package also has the capability to transfer the substance of a work sheet as well as its numerical data.

The package was designed to work with the IBM Personal Computer and mainframes utilizing IBM's VM/CMS operating system. It reportedly operates in conjunction with Xsim, Interactive Data's applications software system. A permanent license for Worksheet costs between $20,000 and $30,000.

Decision Systems, 1033 Massachusetts Ave., Cambridge, Mass. 02138.

THE MEGA GROUP, INC.
Megafile

The Mega Group, Inc. has announced a filing system with relational data base functions and multiple spreadsheet capability for IBM mainframe users with little or no programming background.

Megafile is designed for systems using IBM 3270-type terminals and for integration with The Mega Group's Megacalc and Megalink software, which provide access to the IBM mainframe's memory.

The product's three-dimensional matrix permits the simultaneous access, manipulation and merging of data from more than 30 individual spreadsheets, according to the company. Data reportedly can be accessed in a variety of ways, including individual cells, a range of cells, a record and an assigned block of cells.

Spreadsheets and data bases created in Megafile can be downloaded to personal computers, including the IBM Personal Computer, Personal Computer XT and PCjr, according to the company.

Megafile is available now for IBM MVS/TSO environments and will be available for IBM VM/CMS environments during the first quarter of 1984.

The price for Megafile is $5,000 on the IBM 30 series and $4,000 for the IBM 4300 series.

The Mega Group, 3091 Business Center Drive, Irvine, Calif. 92715.

DATA BASE MANAGEMENT SYSTEMS

TOMINY, INC.
Data Base Plus

Tominy, Inc. has announced that its Data Base Plus application development system is now available for use with the IBM System/36.

According to the vendor, Data Base Plus is a family of software development tools, including a data base management system (DBMS) and a high-level programming language, that reportedly allows users to develop business application systems. With component modules, users define logical file structures, establish interrelationships between files, automatically store and retrieve data, access standard screen and print formats and inquire against the data base for reporting purposes.

The components of Data Base Plus are the DBMS, screen handler, print handler, utilities, query/report writer and the Data Base Plus Programming Language. In addition to the System/36, the components may be run with the IBM Personal Computer, System/34, Series/1 and the 4300, 30 series and 370 mainframes.

The vendor said that applications programs can be moved from one hardware system to another without code changes or program modification. Data Base Plus for the IBM System/36 is compatible with the IBM's SSP operating system and is priced at $19,500 for a one-time development system and an additional $5,000 for the Data Base Plus Programming Language.

Tominy, 4321 Malsbary Road, Cincinnati, Ohio 45242.

COMPUTER RESOURCES, INC.
Application Builder

Computer Resources, Inc. (CRI) has introduced Application Builder, an enhancement to its Relate/3000 relational data base management system for Hewlett-Packard Co. HP 3000 computers.

Builder is a fourth-generation system that permits screen-based applications to be developed quickly, according to the vendor. Builder applications are developed using a standard screen editor that simplifies development and testing. Screen definitions and Builder commands are placed in a single file.

A debugging facility is included to assist the application developer in isolating and correcting problems, reducing debugging and maintenance time.

A built-in testing capability can automatically test files for the user.

Builder directly interfaces with Relate's graphics system and report writer, a spokesman said. It also supports the use of function keys and can call subroutines.

Builder is available for $9,950; Relate for $18,500. Lease plans are available.

CRI, 5333 Betsy Ross Drive, Santa Clara, Calif. 95054.

COMPUTER ASSOCIATES INTERNATIONAL, INC.
Normalization: Guidelines for Practical Data Base Design

Computer Associates International, Inc. has announced a video training course intended to help data base users understand the normalization process of organizing a data base.

"Normalization: Guidelines for Practical Data Base Design," reportedly provides a brief historical perspective of data base management and a step-by-step tutorial approach to normalization. It is designed to help the data center understand the benefits of normalization and to provide the ability to design and manage

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle. See it at a free seminar near you!

Informatics just broke the productivity barrier with MARK V, an extraordinary timesaving application development system. But, MARK V is not for everyone. *It may be for you if:*

- ☑ You need help in reducing your backlog of medium to complex CICS applications.
- ☑ You use CICS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means, with MARK V your programmer need only specify the solution. MARK V generates the *complete* application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—*and that saves you money!*

Reserve your place at a *free Seminar* on MARK V—the simple new way to develop and maintain your medium to complex CICS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll reserve your place at a free MARK V Seminar in a city near you. But attendance is limited. So mail this coupon or call *today*.

ON-LINE DATA BASES

DATA RESOURCES, INC.; DATAPRO RESEARCH CORP.
Datapro/Online

Data Resources, Inc. and Datapro Research Corp. have announced a data base service called Datapro/Online, which contains information about computers, software and the companies that manufacture them.

According to a spokesman, the service provides subscribers with access to information drawn from Datapro's directories of product and vendor information.

The software data base, which is updated monthly, contains reports on software applications, products and companies. The microcomputer data base includes information such as system price, disk capacity, peripherals and communications capabilities. A data base of vendor profiles contains information on computer-related vendors referenced by city, state, product line and sales volume. The data base of on-line services allows users to locate vendors of information, such as stock market prices, newspaper articles and interest rates.

The annual subscription fee for Datapro/Online per company is $250, with an additional $120/connect hour charge.

Data Resources, 24 Hartwell Ave., Lexington, Mass. 02173.

REMOTE COMPUTING SERVICES

INFORMATICS GENERAL CORP.
Informail

Informatics General Corp. has announced Informail, an electronic mail application, for users of its time-sharing service.

Informail's security procedure allows each user to read only mail sent to his mailbox. All files are automatically duplicated to prevent accidental loss of a message, according to the vendor. The mail system includes a step-by-step list of options and on-line help screens for an inexperienced user, the vendor said.

Informail costs 5 cents per message and $25 per hour for users who meet the standard monthly minimum charge of $300.

Informatics General, 21031 Ventura Blvd., Woodland Hills, Calif. 91364.

METHODOLOGIES

QUANTITATIVE SOFTWARE MANAGEMENT, INC.
Slim

Quantitative Software Management, Inc. has announced the Slim service, a software development bid-evaluation service for software development managers.

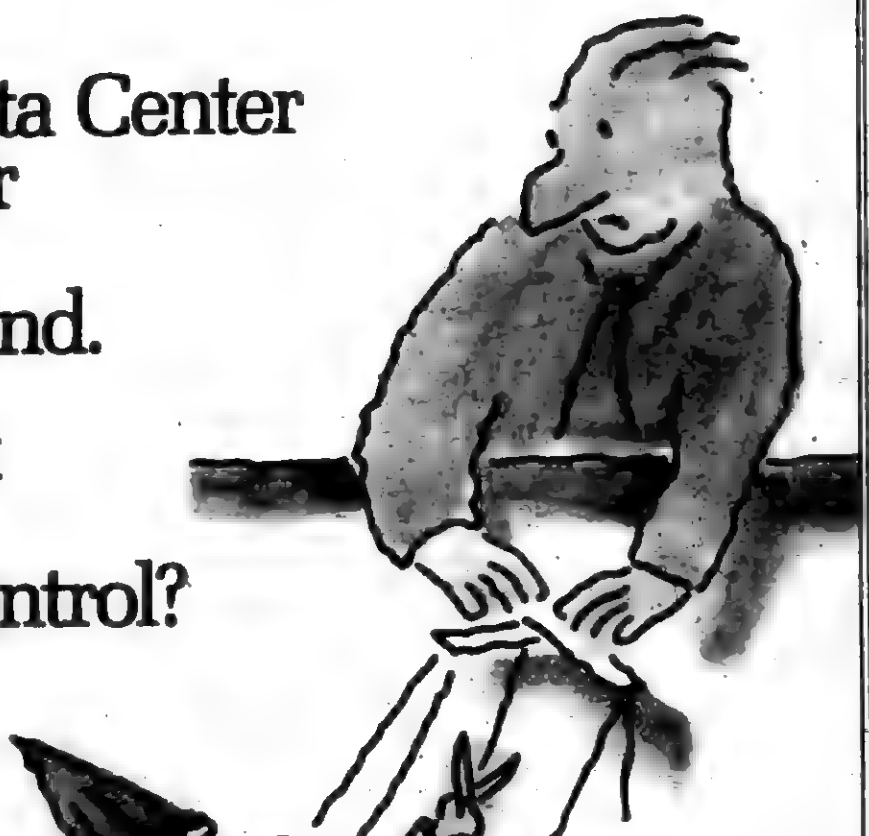
Quantitative Software Management personnel utilize the Slim technique to evaluate an organization's key criteria for cost, man-hours and time in software development projects. On a consulting basis, the Slim service is priced at $75,000, based on three software development bidders.

The Slim software can also be obtained on annual license for $25,000. It is compatible with the Hewlett-Packard Co. HP 80 series desktop computers, the HP 9800 series desktop computers and the Digital Equipment Corp. Decsystem 2060 mainframe.

Quantitative Software Management, 1057 Waverly Way, McLean, Va. 22101.

The Data Center is under your command.

But is it under your control?



Value Computing's systems management software automates the critical tasks of production forecasting and scheduling, capacity planning, and resource allocation and accounting, and brings those tasks under centralized control. Your control.

The effects on data center operations are immediate: a more stable production environment ... faster turnaround ... fewer manual procedures ... shorter night processing times ... fewer mistakes, mis... re-runs ... less management dependency on operations personnel.

In short, a smoother running, better performing data center; a center where managers get the most intensive use of all resources. Without making a major capital investment in additional CPUs or peripherals.

We don't believe there's a more cost-effective way to improve the performance of your data center or the value of its position in your company. Call us and find out why more than 1500 users agree.

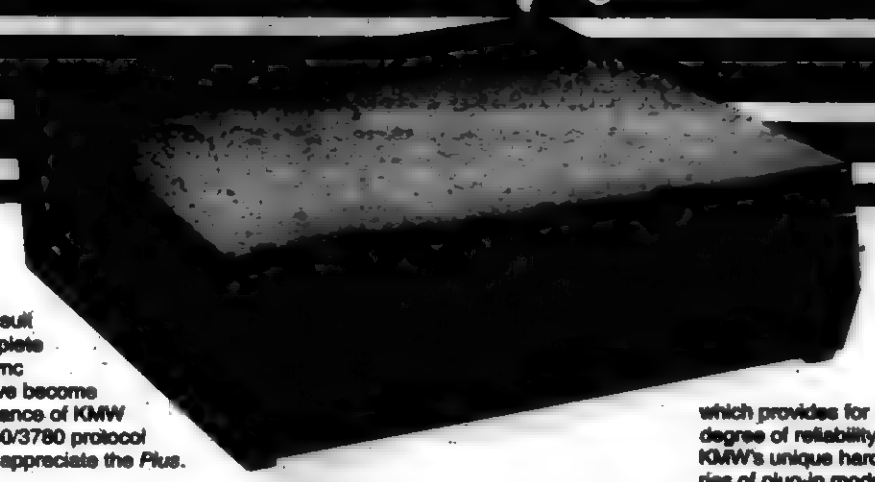
Fluent Communications From a Polished Performer

Series II *Plus*



We've added a little polish to our Series II family of protocol converters. The result is the Series II *Plus*, a complete line of SNA/SDLC and Bisync protocol converters. If you've become accustomed to the performance of KMW 3270, 3770, HASP and 2780/3780 protocol converters, you're going to appreciate the *Plus*.

Pluses

+ Diagnostics

The KMW Series II *Plus* provides three levels of extensive on-board diagnostics for trouble-shooting without ever opening the unit. Level one testing includes PROM and RAM tests as well as confidence tests of most system components. Level two testing is a much more comprehensive test of system components including I/O circuits. Level three is controlled via the system console and includes the ability to move data files to each of the supported peripheral devices.

+ Programmability

Host session and asynchronous device parameters are programmable via the setup mode on the system console. Programmable host session parameters include:

- log on information
- device address
- buffer size
- data rate

Programmable asynchronous device parameters include:

- device type
- character framing
- input mode
- data flow control
- output mode
- data rate

Setup data can be permanently held in EEPROM even when the Series II *Plus* is powered off.

+ Speed

Featuring a Z80A processor, the Series II *Plus* is capable of data rates up to 19.2 Kbps or, with optional Z80B processor and DMA, up to 56 Kbps as well as concurrent operation of up to 8 input/output devices at equivalent rates!

+ Code Compliance

The Series II *Plus* converters meet the FCC emissions requirements and are designed to satisfy those requirements when included in subsystems. The Series II *Plus* is also UL and CSA listed.

+ Fluency

The Series II *Plus* provides fluent communications in IBM SNA and Bisync protocols including 3770, 3270, HASP and 2780/3780. All Series II *Plus* converters support a multitude of input and output devices and are available with up to 8 ports (3 in 2780/3780 converters). You can count on the Series II *Plus* for fluent IBM to ASCII communications.

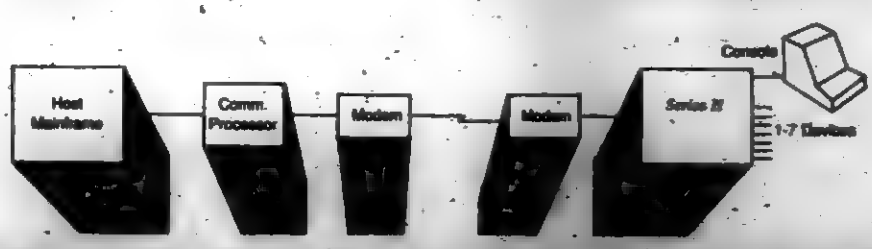
+ Hardware Design

Another Series II *Plus* advantage is the efficient hardware design of the unit. The sleek exterior lines give way to a plug-in modular interior which provides for maximum flexibility, a high degree of reliability and ease of maintenance. KMW's unique hardware design allows for a series of plug-in modules to provide device interfaces. Standard interface modules include Data Products 8 bit Parallel Printer Interfaces, Documation Parallel Card Reader and RS-232 Serial General Purpose Interfaces.

The reliability of the Series II *Plus* design is exemplified by an impressive mean time between failure of over 13,000 hours. That's a real plus.

With a mean time to repair of only 30 minutes, down time is always at a minimum.

The Series II *Plus* is engineered for performance and the proof is in the package.



A Special *Plus*

The Series II *Plus* is available in synchronous-to-synchronous configurations including 3770 to 2780/3780 or HASP to 2780/3780. If your applications require something special, check with KMW.

Add a little polish to your communication. The Series II *Plus* . . .
Fluent communications from a polished performer.

Call Toll Free 800/531-5167

The CPT Solution that talks with mainframes in an important new way:

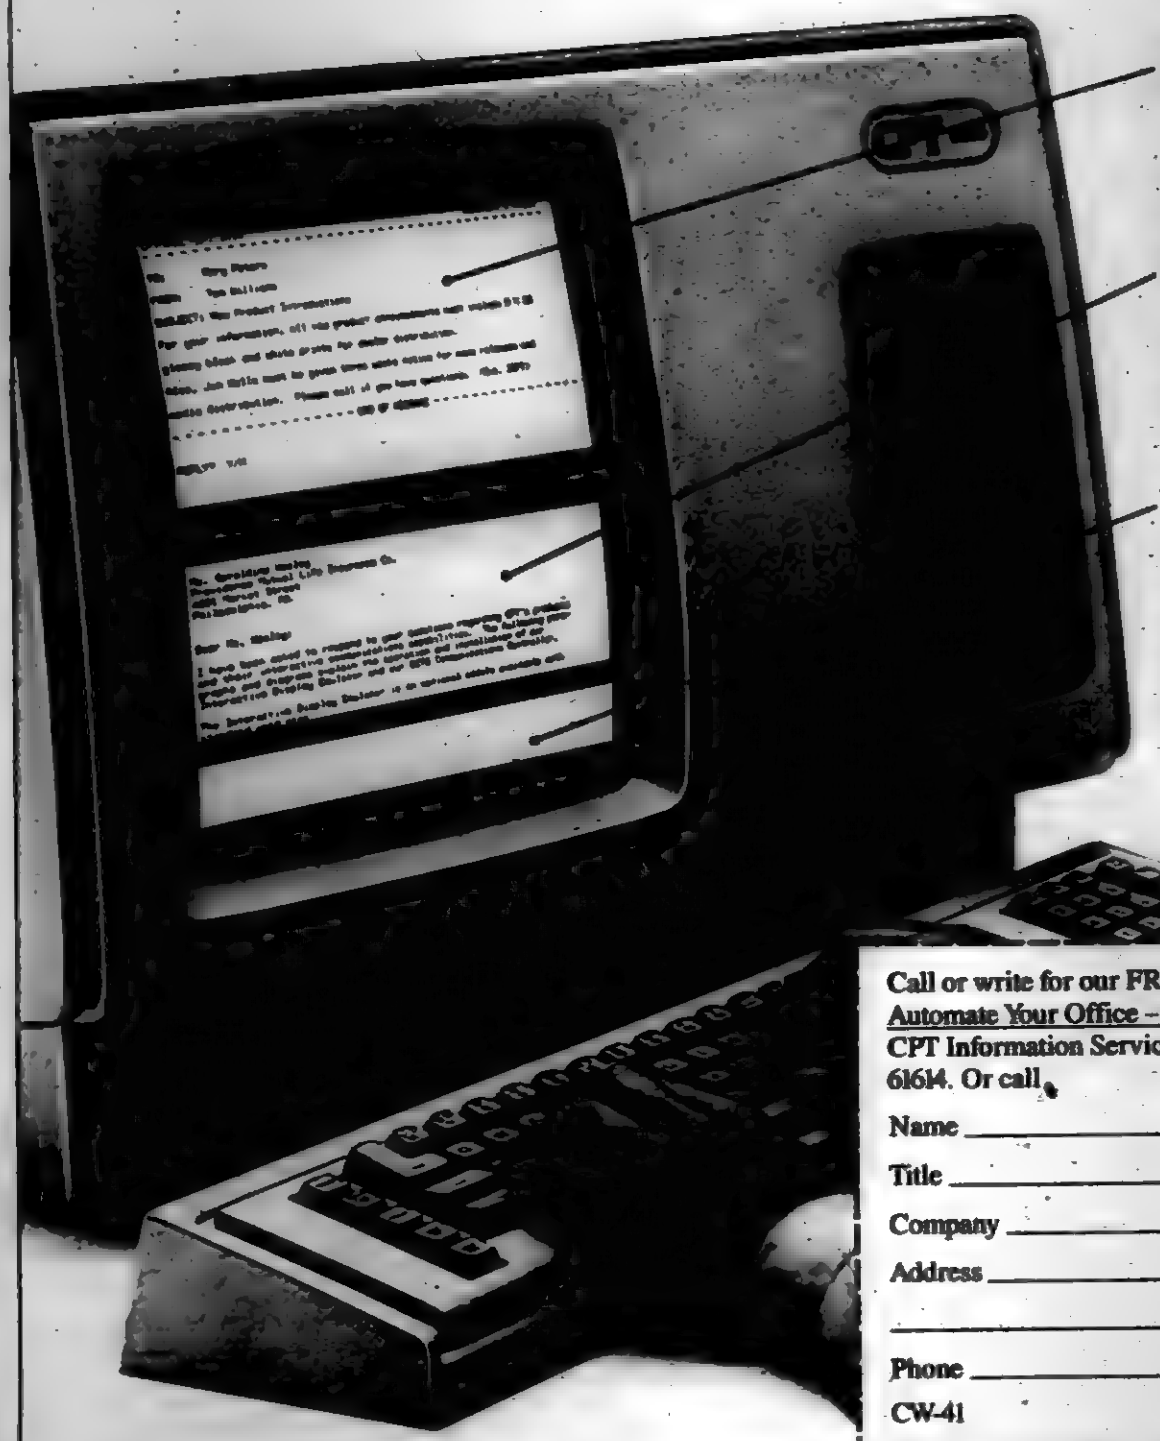
CPT solves the costly, cumbersome problem of separate data terminals and word processors at individual workstations.

An exclusive software breakthrough enables one CPT system to perform both functions. On the same screen. At the same time. We call it the CPT Interactive Display Emulator (IDE).

With this new CPT solution, an operator can transfer data processing information from a host computer (top window) directly to a word processing document-in-progress (middle window). Or vice versa. With just two keystrokes.

In addition, an optional CPT SNA communications controller can link up to 7 CPT systems together as part of an IBM 3270 network.

A few toll-free keystrokes on your telephone will bring you more information. And open some important new windows on the future.



Interactive Communications Window
A full 24-line by 80-column screen that displays information direct from a host computer.

Independent CPT Word Processing Window
A half-page display of the same CPT word processing that's earned a place on the Datapro Honor Roll for the last three years.

Word Processing Preview
Another standard CPT word processing feature. It lets you preview other pages in a document, or scan an entirely different document, without interrupting work in progress.

Specifications are subject to change at the discretion of CPT Corporation.

Call or write for our FREE 28-page booklet, How to Automate Your Office – One Step at a Time!™ Mail to CPT Information Service, P.O. Box 3900, Peoria, Illinois 61614. Or call. CW-41

COMMUNICATIONS

Hughes proposes satellite system

WASHINGTON WIRE

PHIL HIRSCH

A satellite communications system that will enable users to communicate at 1.5M bit/sec through low-cost, small-diameter dish antennas was proposed by Hughes Aircraft Co. in a thick prospectus submitted to the Federal Communications Commission last month here in the nation's capital.

The company wants permission to launch two satellites which would operate in the 20- to 30-GHz (Ka) band.

This is a good deal higher than all previously announced commercial satellites that operate at either 4 to 6 GHz (C band) or 12 to 14 GHz (Ku band).

Satellite channels

Each of the new Hughes Galaxy satellites would provide a total of 3,072 one-way 1.5M bit/sec (T-1) channels through 32 transponders. The earth stations would employ a two-meter antenna and a 1W solid-state transmitter. Hughes expects the total cost of the ground terminal to be less than $50,000.

The system will support private and shared-use voice, video and data networks, the company added. Hughes intends to sell the transponders outright or lease them, although it may offer other terms.

Teleconferencing, high-speed document transfer, remote printing and other data transfer services will be the principal applications of the new system, Hughes said.

Growing demand

"A recent study indicates that the demand for teleconferencing will grow at an annual rate of 59%, reaching annual sales of $430 million by 1987." Hughes "anticipates that the advent of low-cost customer terminals and ancillary equipment made possible by the

Campus net passes test

Runs first year without major gliche

By Robert Batt
CW West Coast Bureau

SAN DIEGO — One of the country's first local-area networks linking an entire university campus has been up and running here for almost a year with no major hiccups.

Before San Diego State University took the plunge with a local-area network, it considered a number of options that would allow it to expand communications facilities for its 33,000 students. Some of those options, according to Robert Swanson, manager of technical support at the university's computer center, were quite exotic. They included:

- A citizens band radio facility.
- An on-campus microwave system.
- A communications system based on optical-fiber technology.
- Twisted-pair cable techniques that would require going point-to-point with all the terminals in the network.

"When you want your machines to have the ability to talk with one another, it is essential to have everything on a single wire, so in the end, we chose a coaxial cable approach," Swanson contended. The advantage to this approach was that the essential technology was available off the shelf.

'Technology was simple'

"The technology was simple, and the bandwidth for communications amazed us in its capabilities and range of capacity compared with the other devices we had looked at," Swanson said.

The university chose Sytek, Inc., a San Jose, Calif.-based manufacturer of broadband computer and telecommunications equipment to supply the interface to the network.

Xerox Corp.'s Ethernet was also considered, "but we did not want to have point-to-point baseband technology, which was all that was available at the time," Swan-

DEC introduces KCT32 for VAX

MAYNARD, Mass. — Digital Equipment Corp. has announced the introduction of a board-level, front-end communications processor, the KCT32, that is reportedly designed for networking and custom communications applications on DEC VAX minicomputers.

Usable in most computer-to-computer and computer-to-terminal environments, the KCT32 has supporting software that allows it to run under the VAX/VMS operating system, according to a spokesman for the vendor.

The processor is said to use the DEC T11 chip and is targeted toward the banking, insurance and telecommunications markets.

The KTC32 has 56K bytes of programmable memory and implements DEC PDP-11 instructions, according to a vendor spokesman.

Special software can be developed on a VAX systems by using the VAX/VMS software support tools, according to the spokesman.

Single boards

The processor employs a single hex-width board and can be initialized by line, for either synchronous or asynchronous data transmission and reception, the DEC spokesman said.

It supports two lines at 64K bit/sec per line or a single line at 130K bit/sec, in full duplex mode, the DEC spokesman said.

The processor is priced from $6,900 to $7,400 with deliveries in the spring, according to DEC.

Digital Equipment Corp., Maynard, Ma. 01754.

HUGHES from page 83

[new satellite system] will accelerate industry and government use of teleconferencing," a company spokesman said.

And since the 1.5M bit/sec channels to be provided by the new Galaxy satellites will be subdividable, the system will also provide "customized switched data circuits for private networks," according to a Hughes spokesman.

'Tremendous benefits'

Hughes added that the new system would "provide tremendous benefits for firms whose businesses involve information retrieval and manipulation."

Hughes said that demand for satellite communication channels will outgrow Ku and C band capacity by 1990.

It cited a recent Western Union Corp. report to the FCC which concluded that "available C and Ku band transponders will fall short of needed capacity by up to 315 transponders in 1990 and up to 1505 transponders in 2000."

The first of the two new satellites is scheduled to be launched in the fourth quarter of 1988, and the second one will be launched a year later. Each will serve the nation's 16 largest cities.

Time of experimentation

The Hughes application comes at a time when Japan and several European countries are experimenting with Ka band satellites.

If the new Galaxy system is approved, it probably will be the first one developed by a U.S. company for commercial service.

Hughes Communications Galaxy, Inc., a subsidiary of the aerospace firm, plans to operate the two new Ka band satellites.

Formerly known as Hughes Communications, Inc., the subsidiary already operates two communications satellites and is making plans for the future to launch two more in the lower bands.

NET from page 83

son noted.

According to the technical manager, the choice of broadband turned out to be a very smart move because it enabled the university technicians to use a wide range of frequencies to make any of its boxes operate.

"In other words, we were not forced to dedicate any particular frequency to a particular set of machines, with the result that any student or teacher can sit at one terminal and talk to any other machine in the network," Swanson maintained.

From the start, the project went like clockwork. Just three months after the initial detailed design was finished, the first transmission on the network took place. Within six months, Swanson said, the network was totally operational.

'The local-area network has completely altered our perspective of computing.' — Robert Swanson, technical support manager, San Diego State University.

Over the last year, the original network, containing 9,000 feet of cable, 200 interfaces to computer ports and terminals and three major mainframe systems, has been expanded twice, so that today the system stands at 16,000 feet of cable, over 300 ports or terminals and 11 major computer systems.

"Our computer simulation tells us that up to 32,500 terminals and computers can be placed on the network," Swanson said.

The present network contains a Control Data Corp. Cyber 170/750 number cruncher with 12 disk drives, five tape drives and two-line printers and one Digital Equipment Corp. VAX-11/780, two VAX-11/750s, one PDP-11/45, five PDP-11/44s and one PDP-11/34.

The Cyber machine communicates with the PDP-11/45 time-sharing system and the PDP-11/44s via communications boards.

Also on the network are 170 Decmate word processors, 90 CRT terminals and several Apple Computer, Inc. Apple II micros, one of which is used as a network manager and one that serves as a backup to the PDP-11/34.

Applications on the network include a transaction-oriented library circulation system; an administrative data acquisition system, used mostly for accounting data; a financial accounting system and a system for keeping all student records. All the instructional computer classes and research performed on campus is monitored on the network.

"The local-area network has completely altered our perspective of computing and allowed us to pursue the distributed processing environment that the campus requires," Swanson said.

Future additions to the network currently under investigation include a campus data security system using encryption techniques; an electronic mail facility that will be the university's first entry into office automation; and a digital private branch exchange system.

In addition, the university will soon be adding off-campus areas to the network, namely off-site student dormitories and a new research center located about a mile away from the main site.

Protocol Converters

Local Data Co.
Protocol converter enhancement

Local Data Co. has announced an enhancement to its protocol converter that allows an asynchronous Ascii CRT terminal or IBM Personal Computer to attach to IBM 3274 and 3276 controllers in emulation of the IBM 3278 Model 2 display station.

The Interlynx/3278 is a standalone controller that connects to an IBM Type A coaxial cable and converts the coaxial interface to an RS-232C Ascii interface, a spokesman said.

According to the vendor, the Interlynx/3278 protocol converter performs multiple interface and protocol conversion functions necessary for driving asynchronous minis and microcomputers; CRT word processing; port selection; and modem and hardcopy terminal communications into the coaxial ports.

Hardware and software changes are not necessary with the Interlynx/3278 protocol converter, according to the vendor.

An optional Personal Computer file-transfer package is available. Support for all Personal Computer compatibles, the Xerox Corp. 860 and the IBM Displaywriter is also available.

The price of the Interlynx/3278 is $1,395.

Local Data, Suite 706, 2701 Toledo St., Torrance, Calif. 90503.

COMMUNICATIONS TECHNOLOGY CORP.
C-9424 RS-232/HP-IL Link

Communications Technology Corp. has announced the release of its C-9424 RS-232/HP-IL Link.

The Cmos C-9424 is compatible with National Semiconductor Corp.'s Cmos Industrial Microcomputer Bus (Cimbus) serial I/O board, with the capability for RS-232C-controlled asynchronous data transfer between a Cimbus Series/800 system and any compatible peripheral.

According to the vendor, it also contains all the circuitry for communications over the Hewlett-Packard Co. Interface Loop (HP-IL). In addition to the two serial communications channels, the C-9424 has provisions for 4K or 8K bytes of read-only memory (ROM), addressable on 4K-byte boundaries. There are 15 possible software-selectable bit/sec rates, ranging from 50 to 19,200.

The C-9424 comes with firmware in a single erasable programmable ROM, which provides an interface driver for the HP-IL, initialization routines and rudimentary debugging tools. The C-9424 is available immediately for $300, and quantity discounts are available.

Communications Technology, 2237 Colby St., Los Angeles, Calif. 90064.

HEWLETT-PACKARD CO.
HP Telex

Hewlett-Packard Co. has announced the HP Telex, a hardware and software package that allows telex messages to be sent from terminals connected to the company's HP 3000 business computer systems.

The product utilizes domestic and international telex networks of major U.S. carriers such as Western Union Corp., ITT World Communications, Inc. and RCA Global Communications, Inc., the vendor said.

Telex messages to be sent using a terminal connected to an HP 3000 may be composed directly on the HP Telex, or they may be composed with any of the HP word processors or other editors currently available on the HP 3000. Incoming messages may be received on any one of several HP printers, according to the vendor.

The system consists of a software package and a telex interface unit connected to the HP 3000. One telex interface can transmit or receive telex messages on the same line, and the software supports as many as eight units and telex lines connected to one HP 3000, the vendor said. The price for the software is $3,500, and the interface unit costs $2,645.

HP, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

COMMUNICATIONS CONTROLLERS

INNOVATIVE ELECTRONICS, INC.
MC-80/600-1

Innovative Electronics, Inc. has announced the MC-80/600-1 communications processor. Emulating an IBM 3274-51C communications controller running configuration support level A, this device converts a Digital Equipment Corp. VT100-compatible terminal into an IBM 3277-1, 3277-2, 3278-1 or 3278-2 terminal communicating with the IBM host using the Ebcdic Binary Synchronous Communications protocol.

The product provides up to 16K bytes of read-only memory, 16K bytes of random-access memory and two serial communications ports. The price for the basic unit is $1,495.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

CABLESHARE, INC.
LSI-X.25 Front-End Processor

Cableshare, Inc. has announced X.29 functionality on its LSI-X.25 Front-End Processor, which reportedly allows remote terminals to communicate with host computers over a packet-switched network as if they were local terminals.

The X.29 support is said to provide host applications control over the functions and operational characteristics exhibited by a remote

Continued on page 87

COMMUNICATIONS

Continued from page 66

tics exhibited by a remote X.25 packet assembler/disassembler.

The front-end processor is designed for use on Digital Equipment Corp. PDP-11 and VAX-11 processors. It is said to handle all X.25 protocol internally.

It is supported for use on DEC's RSTS/E, RSX-11M (M-Plus) and VAX/VMS operating systems. The LSI-X.25 Front-End Processor is priced at $13,000.

Cablesharc, 20 Enterprise Drive, London, Ont., Canada N6A 4L6.

MULTIPLEXERS/ MODEMS

VISIONARY ELECTRONICS, INC.
Visionary 1200

Visionary Electronics, Inc. has introduced the Visionary 1200, a 1,200 bit/sec intelligent stand-alone modem that contains up to 48K bytes of memory for sending, receiving and storing messages, including telex and TWX.

The unit features automatic logon and automatic data capture and retrieval, as well as an internal clock/calendar and on-board software that allows it to send and receive messages automatically, even if the host computer is turned off. The Visionary 1200 transmits at either 1,200 or 300 bit/sec, has memory expandable to 48K bytes and includes two serial ports.

The Visionary 1200 is composed of a Bell 212A modem and an Intel Corp. 8085 microprocessor, while the unit's Cmos memory features full battery backup of all files. Additional automatic features include autoanswer, autodial, autoredial on busy or no answer and answerback. The price of the Visionary 1200 ranges from $795 to $1,095, depending on memory size.

Visionary Electronics, 141 Parker Ave., San Francisco, Calif. 94118.

COMMUNICATIONS SOFTWARE

THE TYPE AHEAD ENGINE CO.
PBX Engine

The Type Ahead Engine Co. has announced an interface package that reportedly transfers telephone traffic data from digital private branch exchange (PBX) systems to the Hewlett-Packard Co. HP 3000 minicomputer.

The PBX Engine is said to allow HP 3000 users to capture traffic data and use their own software or commercially available packages to analyze it.

The product is available at a price of $1,250.

The Type Ahead Engine Co., 534 Rosal Ave., Oakland, Calif. 94610.

LOCAL-AREA NETWORKS

DIGITAL RESEARCH, INC.
DR Soft/Net package

A software package that can reportedly link microcomputers running its CP/M operating system via any local-area network was announced here by Digital Research, Inc.

Introducing its new DR Soft/Net package, the company claimed the product enables offices to tie together diverse personal computer workstations using local-area networks such as Xerox

Corp.'s Ethernet, Datapoint Corp.'s Arcnet and Corvus Systems, Inc.'s Omninet.

The package is said to interconnect micros running any version of Digital's CP/M, CP/M 86 and Concurrent CP/M operating systems.

Networking features reportedly include file sharing, password protection, as well as record and file locking.

In conjunction with Concurrent CP/M, DR Soft/Net is said to provide a file-server capability at each workstation.

According to the vendor, users are able to share files and transfer information and perform other tasks while running an application.

DR Soft/Net does not require dedicating a separate workstation CPU to supervise networking, Digital claimed, and its multitasking capabilities also support transferring data between local and remote processors via a local network, thereby providing full distributed processing, according to Digital.

The product will be sold for $1,000. Digital Research also announced a new compiler design, which it claimed will increase the transportability of applications software.

The first example of the technology, a compiler for Fortran-77, will be released in January, the company said.

The Fortran-77 compiler, priced at $500, will be the first of five new compilers to use the technology and will run on Concurrent CP/M and CP/M 86 operating systems, a spokesman for Digital said.

According to Digital, it will offer IBM PC-DOS and Microsoft, Inc. MS-DOS capability. Compilers for Pascal, C, PL/I and C Basic programming languages will follow, the vendor added.

Digital Research, 160 Central Ave., Pacific Grove, Calif. 93950.

TEST EQUIPMENT

TELECOMMUNICATIONS TECHNIQUES CORP.
Enhancements

Telecommunications Techniques Corp. (TTC) has added two enhancements — a remote control option and an interface module — to its data error analyzers.

A remote control option that provides access through an RS-232 or IEEE-488 interface has been added to the firm's Fireberd 2000 data error analyzer, according to the vendor.

The remote control option is designed for remote access to a long-term, unattended test application, the vendor said.

The DS1 interface module for Fireberd 1500 and 2000 series analyzers acts as data terminal equipment and exchanges a return-to-zero bipolar data signal, a spokesman for the vendor said.

It operates in terminated or bridging mode and allows the measurement and injection of bit errors and bipolar violations, according to the vendor spokesman.

Adding the remote control option to an existing Fireberd 2000 costs $875; adding the DS1 interface costs $375.

TTC, 444 N. Frederick Ave., Gaithersburg, Md. 20877.

AUXILIARY EQUIPMENT

INTERNATIONAL DATA CORP.
Communications Technology Service

International Data Corp. has announced its Communications Technology Service (CTS) to provide businessman and government officials with information about technological advances, as well as the divestiture of AT&T.

Key elements of CTS are said to be a semimonthly bulletin reporting on and analyzing developments in the communications field and quarterly research reports covering industry issues, according to a spokesman for the vendor.

The service is available now at a charter rate of $10,000 per year until April 30 and at a rate of $16,000 thereafter.

International Data, Washington Division, Suite 240, 1500 Planning Research Drive, McLean, Va. 22102.

WESTERN TELEMATIC, INC.
DB-1

Western Telematic, Inc. has introduced its DB-1, a data booster that doubles cable transmission distance, according to the vendor.

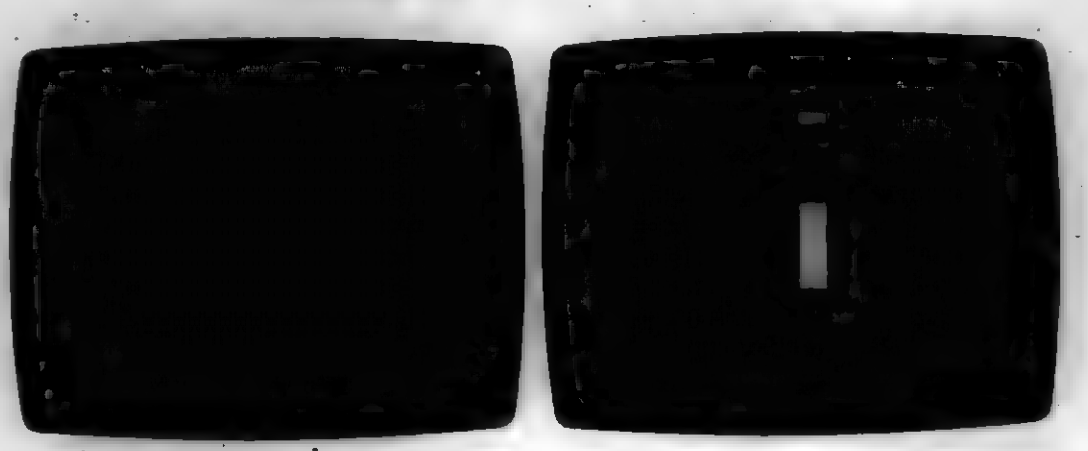
DB-1 acts as a line conditioner and signal booster for data and handshake signals.

The data booster plugs into a cable transmission line, receives signals, filters noise, improves electrical characteristics and boosts signal strength, the vendor said. The data booster also reportedly retransmits a signal downline.

DB-1 is priced at $95, according to the vendor.

Western Telematic, 2435 S. Anne St., Santa Ana, Calif. 92704.

INTELLECT.™
NO SOONER SAID THAN DONE.



To use INTELLECT, the natural language query system, all you have to do is ask—in everyday conversational English—and you'll retrieve. Immediately, in either text or full-color graphics.

INTELLECT, the world's only successful true natural-language query system, is an ideal tool for your information center. INTELLECT's powerful information retrieval capabilities are so advanced that it understands questions and responds with answers as if you were talking to a knowledgeable colleague. Executives access data themselves—more easily than ever before—without learning any technical jargon or "computerese." It's so easy to use, it doesn't even have a training manual!

Whether you use INTELLECT as a retrieval system or as an effective data analysis tool, it transforms raw data in the data base into information and presents it in finished color graphics in a matter of seconds. It's a live dynamic interface that fully integrates your existing database and graphic systems.

Already hard at work in hundreds of organizations, INTELLECT is ideal for marketing, finance, personnel, manufacturing, and banking applications.

INTELLECT is an important technological breakthrough. You can learn more about it by attending one of our nationwide seminars. Or put its amazing power at your fingertips in minutes with one of our demonstration tapes.

Call or send coupon for more details. Look into INTELLECT, and be an eyewitness to the future of computing.

"IDMS/R is the perfect DBMS for the IBM 4300 user."

Frank Chisholm*

Because IDMS/R, with its Automatic System Facility, makes your IBM 4300 as easy to use as a personal computer.

The Automatic System Facility (ASF) is so comprehensive and easy to use that all an IBM 4300 user need do to develop an application is to define a relational record. ASF then dynamically generates all necessary supporting structures including data definitions, screen formats, application processing logic, and documentation. In other words, the developer can witness the application being produced, literally, in seconds. This is what makes ASF a major advance over fourth generation languages. Thus IDMS/R is the perfect system for the IBM 4300 user with limited staff resources.

But suppose when you build a complex, high volume production application with IDMS/R, you desire outstanding performance. Typically, 5% of the data relationships (joins) in any application are accessed 95% of the time. With IDMS/R you can simply change these relationships to predefined joins and benefit from a dramatic boost in performance.

We call it Relational Fastpath. This is what makes IDMS/R a unique relational DBMS, and a perfect system with which to build production applications. In addition, IDMS/R has the most sophisticated back-up and recovery capability of any DBMS, a full integration with personal computers and a complete line of integrated financial and manufacturing applications.

In summary, IDMS/R was designed to satisfy the requirements of the IBM 4300 user who wants to develop both production and end user applications faster and easier.

For further information, attend a Cullinet Seminar. Mail the attached coupon or call the Cullinet Seminar Center at 800-225-9930 (in Massachusetts 617-329-7700).

*Frank L. Chisholm is Cullinet's Executive Vice President. Frank has worked closely with Cullinet users and prospective users for more than six years. As a key member of Cullinet's management team, Frank has contributed heavily to Cullinet's database product development strategy.

Nobody puts ideas on paper so many ways.

If you're using your printer with a personal computer, you probably need one that can handle a variety of functions.

At the same time, the price should be in line with the computer itself. Low.

The pint-sized Dataproducts printer in the picture costs about as much as one good software package.

It prints spreadsheets, graphics and illustrations, labels, multi-part forms—even letters that look like they were typed.

But let's say you're running a big computer and it's hundred-page reports you need. Pronto. Or documents by the millions.

The printer on the right finishes a full computer printout page in less time than it takes to sneeze. At 2,000 lines a minute, it prints much faster than you can see. Three shifts a day. Year after year.

In between these two special-duty Dataproducts printers are whole families of other Dataproducts printers—daisywheel printers, non-impact printers, high-security printers for the government, and more.

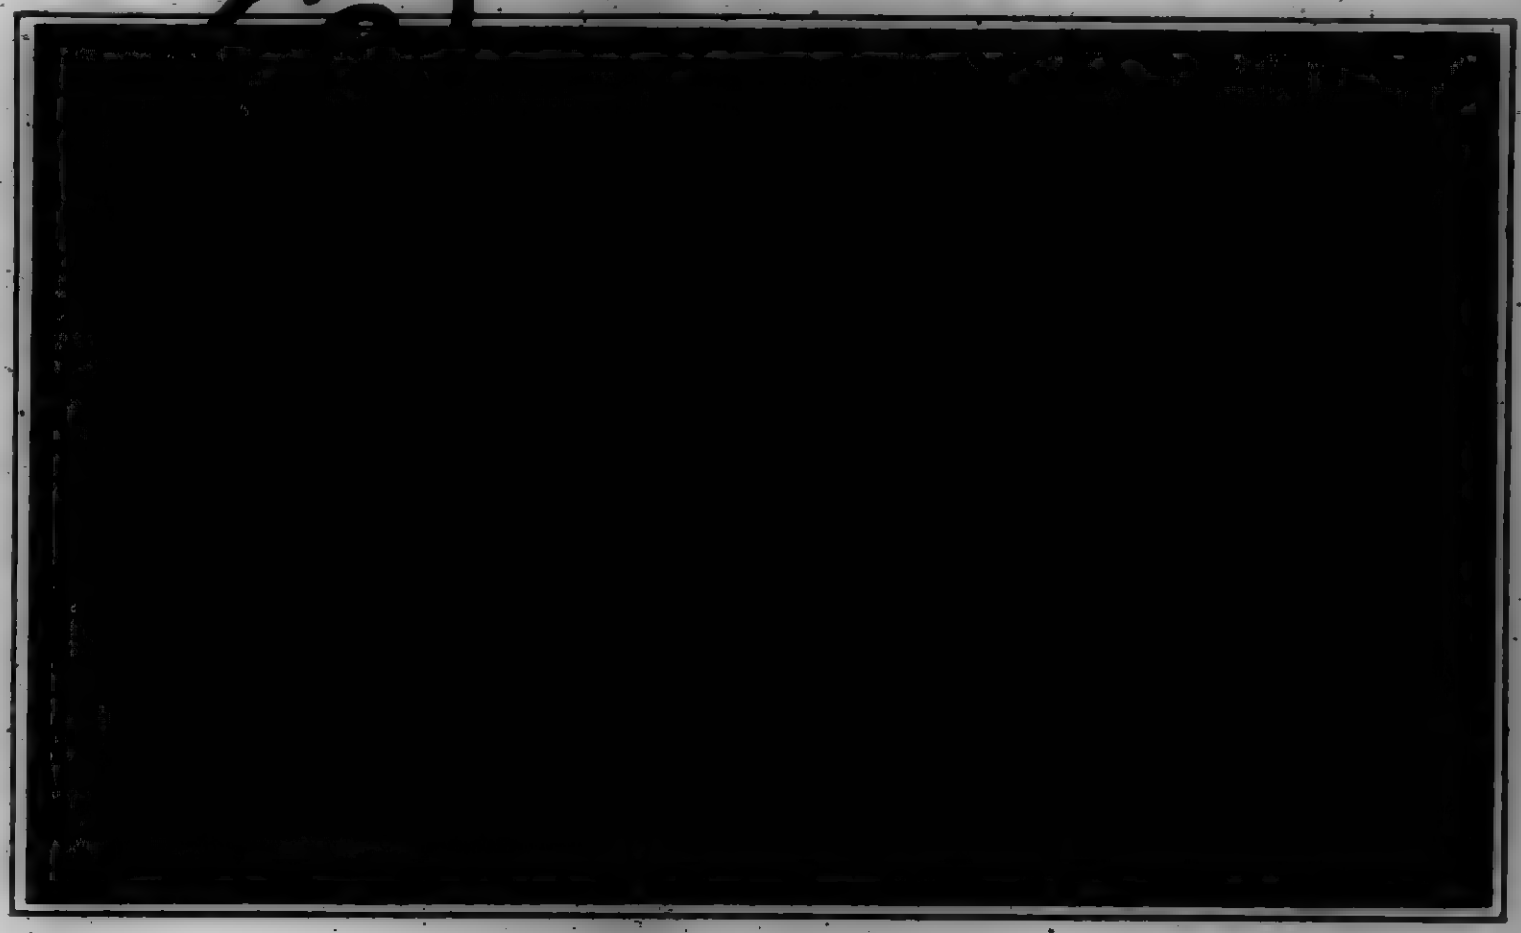
In fact, we make more different kinds of computer printers than any other independent printer company in the world.

Very likely we make one that fits your needs exactly.

Write us at 6200 Canoga Avenue, Woodland Hills, CA 91365. Or phone (818) 887-3924. In Europe, 136-138 High Street, Egham, Surrey, TW 20 9HL England.

Dataproducts computer printers.

IN DEPTH



Lessons from the best-sellers

A three-part series

With a little interpolation and almost no extrapolation, the current best-sellers on general management can be applied to the data processing department.

By J. Daniel Couger

For the first time since best-seller lists have been compiled, the top three in the nonfiction category are management-oriented books. Over the past six months, among the top three sellers have been 1) *In Search of Excellence*, 2) *The One-Minute Manager* and 3) *Megatrends*. Far down the list are the traditional top sellers: cookbooks, physical fitness advice and the sex manuals.

One can speculate on the reason: 1) the state of the economy, 2) the lack of quality in competing books or 3) the turn to seriousness resulting from worldwide crises. I favor a different explanation: The three books simply offer especially meaningful content.

These books would appear to be of interest primarily to boards of directors, chief executives and their immediate subordinates. Not so. They are also important to management at all levels within data processing. Granted, the reader must translate the general principles to the DP experience, and some appear to be only remotely related. But, with a little interpolation and almost no extrapolation, the guidelines in the three books have direct bearing on improving DP management.

I've taken on the task of translating — to DP circumstances — the key points of the three books. *In Search of Excellence* is analyzed here. Future issues will interpret the other two books.

The makings of success

With well over one million copies in print, *In Search of Excellence* is in a category attained by very few books. "It is not a book that is being bought solely by people in the hard-core business community," according to Dan Harvey, Harper & Row publicity director. "It is being bought by people who want to know how to run very small businesses, too."

Authors Thomas J. Peters and Robert H. Waterman Jr. report the results of a 2½-year research project on the key ingredients to success — not just a modicum level of success, but extraordinary success. Sustaining success is another selection criterion. For example, leading the Fortune 500 list this year was North American Coal Co., with an

Part one

increase in profit of 2,276%. Despite its spectacular performance, this company was not included in the compilation by Peters and Waterman. Its success is of short duration.

There is no way of knowing how many copies of *In Search of Excellence* have been purchased by DP managers. Although the title is intriguing to any manager, subjects such as acquisition would not appear to be of direct value to a DP manager. Surprisingly, the material in that section of the book is quite applicable to the DP environment. In fact, most of the book is relevant.

Defining 'excellence'

The researchers, funded primarily by McKinsey and Co., began with a selection of 75 highly regarded companies. They studied annual reports and conducted intense, structured interviews. They also examined some "underachieving" companies for purposes of comparison. "We didn't concentrate much on this," the authors said, "as we felt we had plenty of insight into underachievement in our combined 24 years in the management consulting business."

The researchers did not look extensively at small companies. "Our major concern," they said, "was and is with how big companies stay alive, well and innovative." Therefore, few firms in the sample had annual sales of less than $1 billion or histories shorter than 20 years.

Not all industries were covered. Included were:

1. High-technology companies, such as Digital Equipment Corp., Hewlett-Packard Co., Intel Corp. and Texas Instruments, Inc.
2. Consumer goods companies, such as Proctor & Gamble Co., Chesebrough-Pond's Inc. and Johnson & Johnson.
3. General industrial goods companies, which included Caterpillar Tractor Co., Dana Corp. and 3M (Minnesota Mining and Manufacturing Co.).
4. Service companies, such as Delta Air Lines, Inc., Marriott Corp., McDonald's Corp. and Disney Productions.
5. Project management companies, such as Bechtel Group, Inc. and Fluor Corp.
6. Resource-based companies, such as Atlantic-Richfield Co. (Arco), Dow Chemical Co. and Exxon Corp.

The researchers did not look extensively at small companies. "Our major concern," they said, "was and is with how big companies stay alive, well and innovative." Therefore, few firms in the sample had annual sales of less than $1 billion or histories shorter than 20 years.

The researchers chose six measures of long-term superiority. Three are measures of growth and long-term wealth creation over a 20-year period. Three are measures of return on capital and sales. The six are:

1. Compound asset growth from 1961 through 1980.
2. Compound equity growth from 1961 through 1980.
3. The average ratio of market value to book value.
4. Average return on total capital, 1961 through 1980.
5. Average return on equity, 1961 through 1980.
6. Average return on sales, 1961 through 1980.

To qualify as a top performer, a company must have been in the top half of its industry in at least four out of six measures over the full 20-year period. (In fact, of the 36 companies that qualified, 17 ranked in the top half on all six measures, and another six ranked in the top half on five measures). Thus, any top performer must have scored well over the long haul on both growth and absolute measures of economic health.

As a last screen, the researchers applied a "measure of innovativeness." They asked selected industry experts (for example, businessmen from within the industry) to rate the companies' 20-year record of innovation, defined as a continuous flow of industry bellwether products and services and general rapidness of response to changing markets or other external dynamics.

Characteristics of excellence

The researchers concluded that "the excellent companies were, above all, brilliant on the basics. Tools didn't substitute for thinking. Intellect didn't overpower wisdom. Analysis didn't impede action. Rather, these companies worked hard to keep things simple in a complex world. They persisted. They insisted on top quality. They fawned on their customers. They listened to their employees and treated them like adults. They allowed their innovative product and service 'champions' long tethers. They allowed some chaos in return for quick action and regular experimentation."

Eight attributes emerged as the most characteristic of excellent companies.

1. **A bias for action.** "Although analytical in their approach to decision making, the excellent companies are not paralyzed by that fact."

HUGHES

SOFTWARE SPECIALISTS, COMPUTER SCIENTISTS, DATA PROCESSING SYSTEM ENGINEERS

The people at Hughes Space & Communications Group are proud of their major contributions to space-borne communications.

They are leading the challenge to new technical horizons.

There is a unique team spirit at Hughes Space & Communications Group. A spirit that has created a solid commitment to using advanced technology to develop better and more effective communication.

At Hughes, we know software is *central* to continued success.

Work with some of the most modern and powerful computer equipment and development tools. With top software experts in the field... on projects of vital importance.

It is hard to beat all the advantages that software specialists have at Hughes.

Two-thirds of all commercial communications satellites currently operating were designed and built by the people at Hughes.

Become one of these people with the Space & Communications Defense Systems Division.

Electrical Engineer
Ability to design, interface, test and integrate digital hardware in data processing systems. Must have capability in application of microprocessor and/or bit slice technology. Strong writing skills essential. Requires BS or MS in EE. 10 years experience preferred.

MTS Programmer
Operating system programmer analyst to maintain and improve large scale computer operating systems in PWB/ENG Computer Center. Must have operating system support experience in DEC VMS or UNIX/PWB. Requires BS in CS.

To respond to these and other openings in both the Denver and Los Angeles areas, send resume to Ray Bevacqua at: Hughes Space & Communications, S41/A300, Dept. WC-821, P.O. Box 92919, Los Angeles, CA 90009.

SPACE & COMMUNICATIONS GROUP

■ "Ready — Fire — Aim" is a common practice. The objective is to get something started, then improve on it.

■ Objectives are set at a practical size — a fine sense of the doable.

■ "Chunking" is utilized — breaking things up to facilitate organizational fluidity and to encourage action.

2. Close to the customer. "The excellent companies learn from the people they serve. They provide unparalleled quality, service and reliability."

■ A paramount objective is performance. Maytag Co.'s devotion to dependability earns a 15% price premium while also maintaining top market share.

■ Many of the innovative companies get their best product ideas from customers. Allen-Bradley Co. was driven to robotics not by its central labs but by its customers. DEC relies on customers to find uses for its computers.

■ Emphasis on service. Frito-Lay, Inc.'s 99.5% service level is not just an objective but an accomplishment. Its market share and return on investment are the envy of the industry.

3. Autonomy and entrepreneurship. "The excellent companies foster many leaders and innovators throughout the organization."

■ They don't try to hold people on so short a rein that they can't be creative.

■ They encourage practical risk taking and support good tries.

■ They are a "hive" of champions. A champion is not an intellectual giant or blue-sky dreamer, but a pragmatic person who takes someone else's theoretical construct if necessary and bullheadedly pushes it to fruition.

4. Productivity through people. "The excellent companies treat the rank and file as the root source of quality and productivity gain."

■ Management gets out of the office and onto the floor.

■ Every employee is seen as a source of ideas, not just a pair of hands. RMI, an intensely people-oriented company, with hardly a penny in investment spending, realized an 80% productivity gain over three years.

■ Almost every management says that people are important — but in reality, few place people concerns first in priority as do those companies.

5. Hands-on, value-driven. "The basic philosophy of excellent companies has more to do with their achievements than do technological or economic resources, organization structure, innovation and timing."

■ These companies pay explicit attention to values.

■ All of them have a well-defined set of guiding beliefs on which all policies and actions are premised.

■ Ironically, the companies with the most quantified statements of mission (precise financial targets) have done less well financially than those with broader, less precise, more qualitative statements of corporate purpose.

6. Stick to the knitting. "While there are few exceptions, the odds for excellent performance favor those companies that stay close to business they know well."

■ The most successful companies diversify around a single skill — the coating and bonding technology of 3M, for example.

■ The next group, in descending order of success, branches out into related fields — for example, General Electric Co.'s leap from electric power generation turbines to jet engines (another turbine).

■ Finally, the highest risk area — acquiring "a window on a new skill." These companies make sure the acquisition size is manageable enough to allow early, painless integration.

The authors found that successful companies are a "hive" of champions. A champion is not an intellectual giant or blue-sky dreamer, but a pragmatic person who takes someone else's theoretical construct, if necessary, and bullheadedly pushes it to fruition.

7. Simple form, lean staff. "Making an organization work has everything to do with keeping things understandable for the tens of thousands who must make things happen. The excellent companies keep things simple."

■ Size generates legitimate complexity; nevertheless, staff is deliberately kept small.

■ Virtually none of these companies has a matrix organization. Even in Boeing Co., Inc., where many of the matrix ideas originated, people operate in a binary way — they are either a part of the project team or are part of a technical discipline. No confusion exists about questions such as, "Which boss do I report to on this one?" or, "Do I keep everyone informed?"

■ Decades ago, Americans got hooked on a span-of-control guideline of five to seven people. Many of the excellent companies use the flat organization — fewer than seven levels of management compared to the more than 12 levels found in

FALCON
on-line data entry that's above and beyond the ordinary

For an easy-to-use, completely interactive data entry system that's designed especially for the end user, you need FALCON.

FALCON operates standalone or as a task under CICS and the other major TP monitors giving you total flexibility and performance. It supports both DOS and OS operating systems to provide versatility and upgrading capabilities. And FALCON automatically converts VIDEO/370 formats.

FALCON's high-level security system protects your data against unauthorized access. It lets you decide which operators can use specific functions. And with FALCON you never worry about losing data. If the system fails, all data is recovered. If a terminal breaks down, just go to another terminal, rescue your data, and start working – right where you left off.

FALCON's on-line instructions help you design screen formats, enter and verify data, maintain files, create tables, and submit your own jobs. Just touch a key, tell FALCON what you want to do, and the instructions appear right on the screen.

With FALCON, you can make decisions based on the productivity of your operators without leaving your office. You can monitor the progress of all active terminals and view job accounting statistics on-line.

FALCON's built-in edits include table lookup, range testing, defaults, balancing, and much more. FALCON goes far beyond other data entry systems to let you use your terminal as an operator's console and view the activity and contents of the input and output queues.

So make sure you're getting the most from your resources. Choose FALCON. Call for a free trial. You'll be glad you made the right choice.

FALCON

other corporations.

8. Simultaneous loose-tight properties. "The eighth item is mostly a summary point. It is the coexistence of firm central direction and maximum individual autonomy."

■ The excellent companies push autonomy down to the shop floor or product development team, but are fanatic centralists around the few core values they hold dear.

■ Cost control and efficiency *follow* from the emphasis on quality, service, innovativeness, result sharing, participation, excitement and a problem-solving focus that is tailored to the customer.

■ The nature of the rules is crucial here. The rules in the excellent companies have a positive cast. They deal with quality, service, innovation and experimentation. Their focus is on building, expanding, *the opposite of restraining*; whereas most companies concentrate on controlling, limiting, constraint.

Excellence in dp management

1. Proactive instead of reactive.

■ Opportunistic: The system plan is oriented toward under-girding the objective of the firm — it is not just a consolidation of user requests for applications.

■ Innovative: Systems are designed to give the firm a competitive advantage, not just efficiency. An example is the order system of American Hospital Supply Corp. where the service is so comprehensive that the firm gained a major share of the business.

■ Prototypic: Do it, try it, fix it.

2. Listening to the user — intently and regularly.

■ Openness: Avoiding the attitude that users don't know enough about the technology to make creative contributions to design.

■ Joint venture: Eliminating the "we/they" atmosphere. Cooperatively creating a "Maytag," resulting in the "lonely repairman" environment.

■ Service orientation: "When our customer looks good, so do we." Top executives who were previously DP managers believe that peer evaluations significantly affected their promotion.

3. Concurrence in objectives, freedom in design.

■ Avoiding myopia: Not limiting design alternatives in hopes of expediting system development. Assurance that the best solution is attained can occur with only 5% of the project budget devoted to this phase of the life cycle.

■ Designating presidents: Once the project objectives are clarified, letting the leader be "president of his company" — with considerable autonomy in meeting objectives.

■ Nourishing champions: "A new idea either finds a champion or dies" — Edware Schon.

4. People are our most important resource.

■ Grab a grizzly: Originated by Hewlett-Packard, this concept means that people will tackle almost impossible tasks when they believe they have personal impact on a worthwhile project.

■ Respect: "People will flood you with ideas if you let them. Treat people as adults. Treat them as partners. Treat them with dignity. Treat them with respect. Treat them — not capital spending and automation — as the primary source of productivity gains" — Peter Smith.

■ Feedback: Which one of us does not have almost instant recall on positive feedback, regardless of its remoteness? For example, we still remember the positive strokes from elementary teachers, coaches and counselors. Creative managers think of dozens of ways to encourage their people.

DP in some banks had disastrous results when it went into the service bureau business, just because it had excess capacity. The experienced competition clobbered them. Other banks were successful because they marketed their expertise — application packages. They used proceeds to underwrite more sophisticated applications than they could have otherwise afforded.

5. Demonstrating the value of values.

■ Value clarity: Translating the company's "guiding beliefs" into tangible entities. For example, identifying how system specifications can include provisions to enable a user department to achieve its quantitative objectives.

■ Value application: Making sure that the company's "guiding beliefs" are really guiding DP management actions.

■ Interaction: Managers who are also leaders are out interacting with their people — not to monitor performance but to encourage and share ideas and ideals.

6. Leveraging strengths.

■ Concentrating on lifestream systems: Ensuring the efficacy of those systems key to the life and

m3278/SPF puts micros on-line to mainfra

Included in the m3278/SPF package is FODX communications by CXI.

growth of the firm.

■ Judicious expansion: DP in some banks had disastrous results when it went into the service bureau business, just because it had excess capacity. Their experienced competition clobbered them. Other banks were highly successful because they marketed their expertise — application packages. They used proceeds to underwrite much more sophisticated applications than they could have otherwise afforded.

■ Evolution, not revolution: Only agree to be the beta test site — for both vendor hardware and system software — when you gain a quantum leap on competitors. Accept risk in high-ROI areas where you are most knowledgeable — application software.

7. Tight belt, loose coat.

Is it possible for a DP department to reach the plateau of excellence within a company that itself is not on the Peters/Waterman list? The answer is yes, unequivocally.

■ Destaffing: How? One way is rotating line people through staff positions to minimize "staff" attitude and to avoid staff empire-building.

■ Matrixless: Use "one-supervisor" philosophy. Clarity of direction offsets inconvenience and cost of going outside the project team for high-tech advice.

■ Looseness: Allowing undulating boundaries so teams can continuously interact and share ideas.

8. Centralized decentralization.

■ Flexibility: Using a fluid organizational structure to take advantage of technological advances. For example, as network costs diminish, transferring people and computing capability to user nodes to ensure close communication.

■ Centrality: Keeping at central core only those activities which will be diluted by decentralization, such as corporate system planning/control and design of company-wide systems.

■ Centralist values: When values are central, implemented in people-oriented programs, desired results in areas like standard-compliance and performance (both quality and quantity) follow naturally.

Milestone excellence possible

Is it possible for a DP department to reach the plateau of excellence within a company that itself is not on the Peters/Waterman list? The answer is yes, unequivocally. An example is the DP department of American Hospital Supply. Two others where I have observed conformance to a majority of the eight criteria for excellence are the Hartford Insurance Co. and Ford Motor Co.

An interesting question is whether the converse is true. Do any of the top achievers have a less than successful DP department? Data is not available to answer that question. On the other hand, there are some DP departments in the "excellent" companies whose excellence is generally recognized. Texas Instruments is one. Another is IBM.

Although only two excellence criteria refer specifically to people-orientation, that emphasis pervades. While company performance is the principal evidence of people-orientation, the authors included numerous supporting statements from managers.

Delta President Tom Beebe describes an open-door policy for everyone from pilots to flight attendants. No one — not the chairman, president or vice-president — has an administrative assistant whose job it is to screen such visitors. Hewlett-Packard's Bill Hewlett relates his conviction that employees want to do a good job, a creative job, and will do so if given the proper environment. Key here is treating workers with consideration and respect.

The following statement by Peters and Waterman not only summarizes the main factors which identify the excellent companies, it also serves well as the set of guiding beliefs for a DP department aspiring to excellence: "These companies are simultaneously externally focused and internally focused — externally in that they are truly driven by their desire to provide service, quality and innovative problem-solving in support of their customers; internally in that quality control, for example, is put on the back of the individual line worker, not primarily in the lap of the quality control department. Service standards likewise are substantially self-monitored. The organization thrives on internal competition. And it thrives on intense communication, on the family feeling, on open door policies, on informality, on fluidity and flexibility, on nonpolitical shifts of resources. This constitutes the crucial internal focus: the focus on people."

About the Author

J. Daniel Couger holds the title Distinguished Professor of Computer and Management Science at the University of Colorado, Colorado Springs. He has lectured in more than 50 countries and written 15 books and more than 60 papers.

Prior to his academic appointment, Couger served as a manager in the computer field. In 1977, he was selected as U.S. Computer Science Man of the Year.

mes and cuts application software backlog.

A recent survey found that an average mainframe user would have to wait 3½ years for development work to begin on an application requested today.

That's a long time to wait.

In the same study, managers felt on-line programming offered the greatest potential for reducing the backlog.

It was their number one choice.

If on-line programming offers the greatest potential for cutting application program development backlog, what's the problem?

Simply this.

A limited number of programmers have mainframe access at any given time.

m3278/SPF™ can help.

Programmers on staff become more productive.

Productivity is substantially increased with m3278/SPF.

Why?

Because the programmers' workstation is not down while programs are compiling or downloading.

Coding continues without interruptions.

You may be able to eliminate application backlog without adding programmers. But, it is comforting to know programmers can be added without the expense of another host.

A substantial increase in the number of on-line programmers is possible with m3278/SPF.

The number of on-line programmers is doubled with m3278/SPF™ when only 40% of the programming effort is in Edit/Browse mode. But, when 90% of the effort is Edit/Browse, a whopping 7 to 1 increase of on-line programmers is realized.

With m3278/SPF,* IBM PC users are directly on-line with the host computer via direct (coax) link at channel transfer rates.

Including uploading and downloading programs or datasets. Attaining dataset listings as well as creating local new files or editing pre-existing ones.

Your IBM PC is a distributed SPF workstation allowing simultaneous local and remote SPF software.

Microcomputer uses are unparalleled when m3278/SPF operates under PC-DOS.

In addition, a multitask version of m3278/SPF is available for concurrent CP/M-86 users.

Users can perform several tasks at one time by swapping between functions and programs instantly.

For example, editing, compiling, and transferring can be performed simultaneously.

m3278/SPF emulates the 3278 terminal, yet surpasses its capabilities.

No time lost re-educating programmers.

With m3278/SPF,* experienced programmers can quickly and easily recognize the SPF emulation characteristics and operate more efficiently.

Overloading eliminated.

By performing editing functions locally, problems related to mainframe overloading are eliminated.

Mainframe datasets or source programs can be brought down to the microcomputer. Using the same mainframe software in an off-line fashion, datasets can be modified and returned to the mainframe.

No overload. No downtime. No trouble.

How you can cut mainframe application software development backlog.

m3278/SPF™ is announced for the IBM Personal Computer* and all IBM board compatible 16-bit microcomputers.

To find out how m3278/SPF™ can help turn the 3½-year wait into a tolerable number, contact us today.

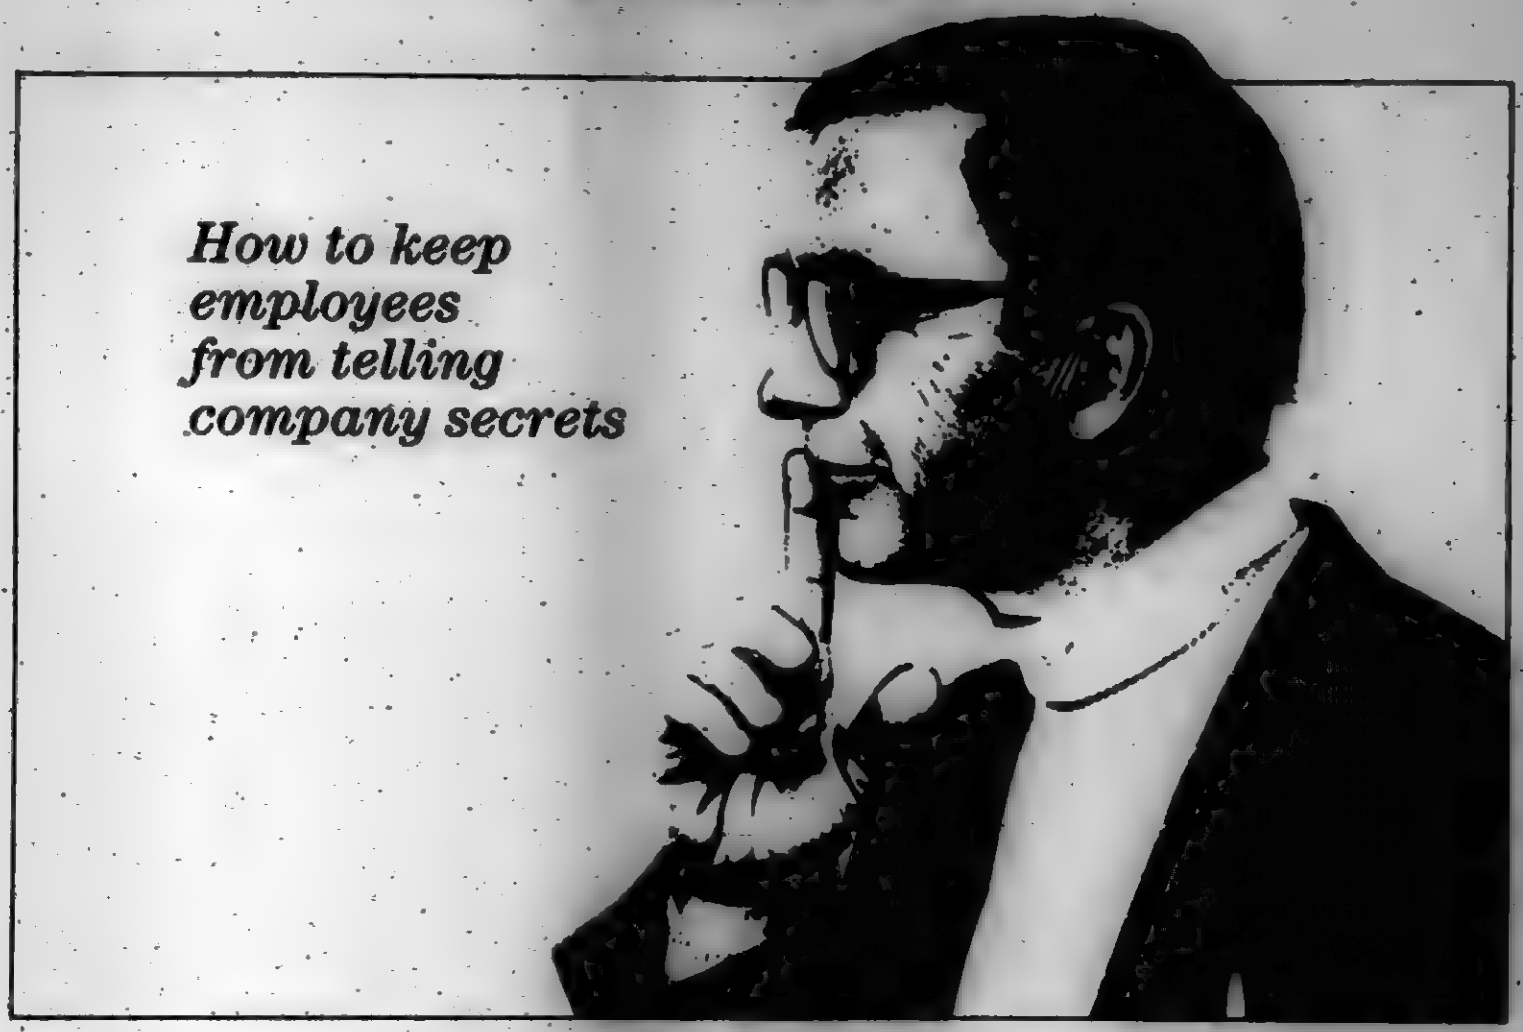
IN DEPTH



Negotiating, drafting, executing and enforcing employment contracts

The absence of a carefully drafted employment contract can be devastating to a firm whose business survival depends on the protection of its proprietary rights.

By Tobey B. Marzouk

Firms operating in the high-technology marketplace often commit a crucial business error: They fail to provide an employment contract that limits employees' ability to divulge confidential information and compete with or otherwise damage the employer.

Since the employment contract will ultimately govern relations between employer and employee, it is essential for any firm working in the high-tech area to establish careful procedures for negotiating the agreement. Failure to comply with certain procedural and legal requirements before executing a contract may nullify its effect or preclude its enforcement. A firm engaged in contract negotiations with prospective employees should observe the following guidelines.

1. Watch what you say during contract negotiations. Company representatives should be extremely careful in what they say to prospective employees. Even though a contract may be drafted to prevent an employee from enforcing oral commitments not embodied in that contract, a court may, in certain circumstances, rely on oral statements made by the employer to determine the meaning and intent of the parties.

In Weiner vs. McGraw-Hill, Inc., which was decided in New York in 1982, a prospective employee was assured by a company representative that the firm's policy was to terminate employees only for "just cause," and that employment at the company had the advantage of job security. The employment contract also referenced the employer's personnel handbook, which represented that "the company will resort to dismissal for just and sufficient cause only."

After several years of employment, the employee was dismissed for "lack of application." He subsequently brought suit against his employer for wrongful dismissal. The New York Court of Appeals held that the employee could sue his former employer based on the oral representations and assurances made to him prior to his employment, as confirmed by the statement of policy set forth in the firm's personnel manual.

Clearly, an employer should not make any gratuitous oral promises during contract negotiations. If relied upon by the

prospective employee, those promises may come back to haunt the employer later.

3. Carefully draft personnel policy manuals. In addition to oral assurances made by the employer during contract negotiations, written statements in office handbooks or personnel manuals may be used to expand an employee's rights under a contract. In several recent court cases, employees have been able to enforce personnel policy manuals as supplements to their employment contracts and thereby bind their employers beyond the specific terms of the individual contracts.

While a personnel manual serves the useful function of informing employees of company policies, a firm must exercise extreme caution in drafting the manual. A statement should be included that the manual is not intended to constitute any type of contract between the company and the employees. Include words to the effect that the policies set forth in the manual, particularly those involving employee terminations, are meant only as guidelines, not rigid standards.

This disclaimer should not, however, be used as a substitute for careful drafting of the manual's contents. Where the disclaimer contradicts other expectations raised by the contents of the manual, the ambiguity in the manual will be construed against the employer. In addition, the manual should not include unnecessary detail about termination policies. The more specific the standards and procedures for termination, the more likely an employee will claim substantive and procedural rights arising from the manual and the more likely a particular termination will violate the standards set forth in the manual.

In short, a personnel or office manual may be used against an employer. The employer should make every effort to limit the binding effect of the manual to avoid unforeseen liabilities to employees.

4. Give the employee ample opportunity to review the contract. Often, high-tech firms present a proposed employment contract to a new employee on his first day of work, thereby giving him no meaningful opportunity to review the contract or negotiate specific terms. As a matter of policy, however, the firm should provide the prospective employee a copy of the employment contract before he starts work. Following this procedure will guard against any allegation that the employee was placed at a disadvantage relative to the employer.

An employer who fails to give a prospective employee this opportunity to review the proposed contract may be unable to enforce it, particularly if a court concludes that the employee was not given a fair chance to negotiate the terms of his employment. In Pemco Corp. vs. Rose (decided in 1979), the defendant was offered and accepted employment with an engineering firm in West Virginia. Thereafter, the defendant canceled his housing lease in Washington, D.C., signed a contract to purchase a home in West Virginia and moved all his personal belongings to his new place of residence. When the defendant arrived at his employer's offices for the first day of work, he was asked to sign an "agreement" restricting his right to compete with his employer should he leave the firm.

Having already moved to West Virginia, the defendant had no choice but to sign the contract. In an action by the former employer to prevent the defendant from working for one of the employer's competitors, the court concluded: "Under the circumstances in which the employee found himself, it is beyond cavil that his ability to negotiate with respect to the postemployment restraint was markedly diminished. At the very least, the employee was not as freely able to bargain concerning the provision as he was at the time [he received the offer of employment]. The covenant not to compete was not a freely bargained-for term or condition of employment, but rather was a term or condition of employment extracted from or imposed upon an employee under circumstances which deprived him of any fair ability to negotiate."

Failure to provide the prospective employee with a

"Service is our middle name."

"We'll definitely be there Monday."

"Trust me."

TALK IS CHEAP.

Good service, however, isn't.

Which is why in the last three years Burroughs has invested over $100 million worldwide on improving our service and support.

For example, we spent a small fortune on the Burroughs Respond System—a sophisticated computerized operation that insures fast service for our customers. (Our average response time for mainframes is already under two hours, but we're determined to do even better.)

Our new $23 million Lisle Training Center is a "Service University" that trains many of our 16,000 service and support people in the latest state-of-the-art computer technology.

Our experts are taught, for example, to use a highly advanced diagnostic device called a logic analyzer which is remotely controlled so they can diagnose complex problems instantly from our customer support centers without the delay of travelling to your company.

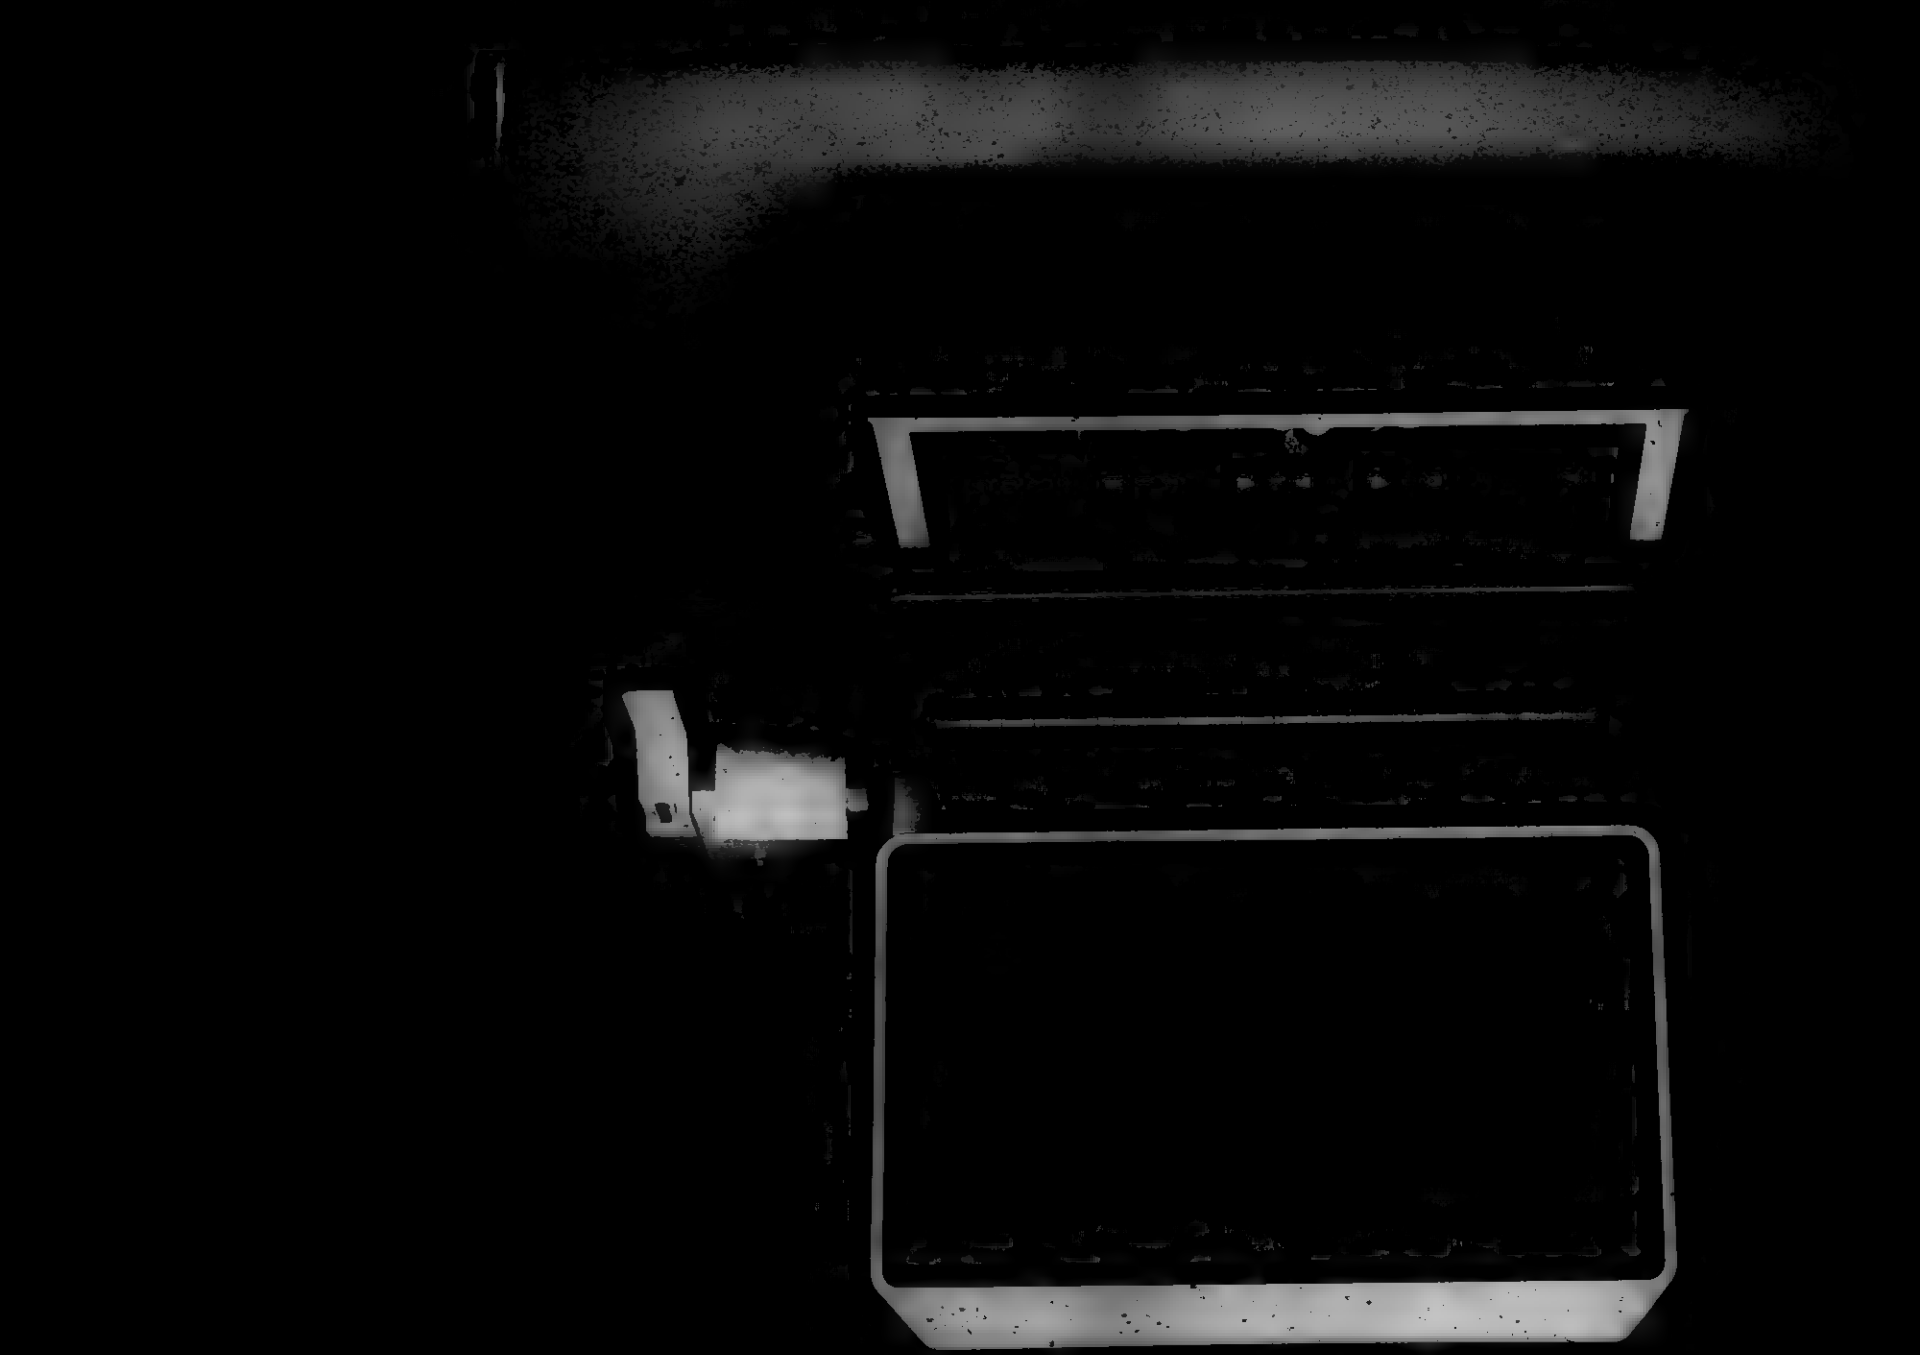
What's more, the new Burroughs Parts Inventory Management System is designed to get you the right spare part at the right place and at the right time.

What all this adds up to is that Burroughs is committed to doing everything humanly (and electronically) possible to provide our customers with the best service and support in the industry.

And with $100 million behind that commitment, it's a lot more than just talk.

Burroughs

THE QUESTION ISN'T WHO'S BIGGER. IT'S WHO'S BETTER.



PRESENTING THE ONLY 100-YEAR-OLD PERSONAL COMPUTER.

TOO MANY COMPUTERS, TOO FEW CHOICES.

With the personal computer shakeout at hand, people are beginning to ask some hard questions about personal computer companies.

Of the 200 or so personal computer companies now operating, how many have the resources to fully support their products? How many can offer the experience and financial strength of 100 successful years in business?

How many can provide in-depth sales and maintenance training to dealers? How many have actually done so?

How many have thousands of qualified field engineers in place throughout the nation? How many can back up their commitments to technical advancement with truly significant R&D budgets?

How many will even be making personal computers a few years from now, much less sustaining their commitment to their customers beyond 1990?

Companies that can answer those questions positively are the only real choices the personal computer user really has. There aren't many. And they're getting fewer all the time.

THE NCR PERSONAL COMPUTER.

That's why we developed the NCR Personal Computer. By all these criteria, it's the best choice for PC users.

For over 100 years, we've been helping businesspeople solve their problems. As a result, they believe in our products. And they trust our support before and after the sale.

They're not surprised to hear that NCR builds a dual 8/16-bit Personal Computer with up to 512K that runs CP/M* and MS DOS.* They expect it from NCR.

Nor are they surprised by our Personal Computer's other advanced features. Like superior color graphics. 20 programmable function keys. Windowing capabilities. Expansion slots for quick, in-the-field upgrades. A remarkable plug-in diagnostic module.

All in a box smaller than those of its leading competitors. Plus a software library that includes the majority of the most widely used packages.

They expect nothing less from NCR.

And neither should you.

ESTABLISHING BETTER INTERPERSONAL COMMUNICATIONS.

It can connect up to 64 PCs from most major manufacturers, with the latest local area network technology.

PCs in the network can access databases and share files, records and peripherals. That helps every member of an organization work together, with the same common information, at the lowest possible cost.

SOMETIMES IT'S BETTER TO BUY RETAIL.

THE NCR PERSONAL RETAIL COMPUTER.

No other company is better qualified to build a Personal Retail Computer than NCR.

We pioneered the cash register, back in 1884. Since then, we've continually enhanced new retail management technology. From small point-of-sale terminals to state-of-the-art, multi-user inventory management systems.

Our Personal Retail Computer is the first of a new breed. An advanced retail management system with all the capabilities of a powerful personal computer. All in one small package. And all designed with the experience of 100 years as the world's largest supplier of retail systems firmly in mind.

HOW TO SELL RETAIL.

It's easy.

The NCR name is a quick foot in the door. And from there on, the Personal Retail Computer's advanced features sell themselves.

The PRC comes with 256K of memory, expandable to 512K with a plug-in cartridge. An electronic cash drawer and a choice of a receipt or an 80-column report printer, or both, complete the hardware package.

But it's the PRC's retail management capabilities that make it such an easy sell.

First of all, it's easy to use. Really easy. 9 dedicated function keys handle standard transaction sequences with a single keystroke. Keying errors are easily corrected, eliminating time-consuming voiding procedures. Helpful screen messages, in plain English, guide clerks step-by-step through each transaction.

Commands are in plain English, too, so clerks don't have to be trained to remember confusing codes. And with an optional bar code reader, sales data can be fed into the system automatically.

The system is secure, as well as easy to use. Access is granted or denied by an I.D. number verification routine. And sensitive sales information can be password-protected, field by field.

And of course sales reports can be automatically generated by salesperson and item at any time during or after the business day. So users can keep better control of their business.

To extend that control even further, our optional Inventory Management software can store up to 19 separate facts about as many as 32,000 unique inventory items.

Inventory levels are then automatically displayed and adjusted during each sale, giving store managers a clear picture of what they have on hand at what prices. A CPA-recommended profitability index is an integral part of the package.

To make our retail management system into a complete company management system, our retail software can be interfaced with general accounting packages.

All at a price far lower than a traditional retail management system.

Surprised?

You shouldn't be.

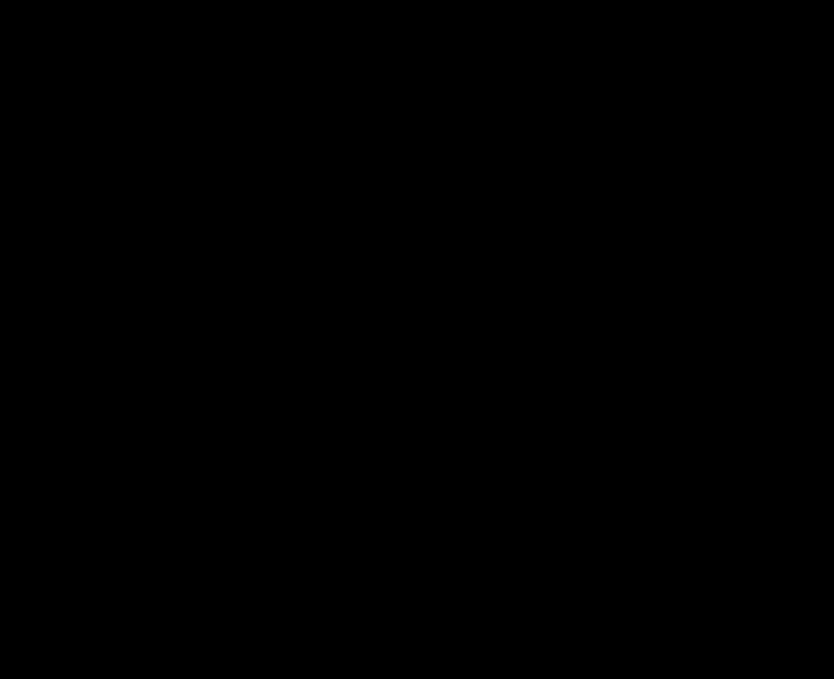
CHOOSING THE
RIGHT COMPUTER COMPANY
IS EVEN MORE IMPORTANT
THAN CHOOSING
THE RIGHT COMPUTER.



NCR PERSONAL COMPUTER

Feature Highlights
- Integrated design with small footprint
- VLSI technology
- Dual processors (8/16-bit)
- Customer installable
- Monochrome or color display
- Customer upgradable
- Fully illustrated self-training documentation
- Industry standard I/O interfaces
- Expandable memory and disk storage
- Detachable low profile keyboard
- Easy-to-use diagnostic cartridge
- Industry standard operating systems
- Powerful graphic processor
- Windowing capabilities

Central Processor	Z-80A® 8-bit (4 MHz) 8088 16-bit (5 MHz)
Memory	RAM—64K Upgradable to 512K ROM—4K
Graphic Processor Memory	32K (monochrome) 96K (color)
Video Display	12" monochrome green/black or color 24 lines 80 characters/line 640 x 400 dot addressable
Keyboard	Detachable low profile Alphanumeric + numeric key pad 20 programmable function keys
Disk Drives	Configured with two flex disks or one flex disk and one Winchester disk
Flex Disk	5¼-inch integrated Double density, double sided 500 KB each unformatted 320 KB each formatted
Winchester Disk	5¼-inch 10 MB integrated or 30 MB external
Peripheral Adapter	Centronics parallel interface RS232C serial interface

copy of the employment contract prior to employment may seriously undermine the validity and enforceability of the contract.

4. Determine whether the prospective employee is bound by a prior employment contract. Given the frequency of job changes among professional employees at high-tech firms, an employer should know whether a prospective employee is bound by a contract with a former employer that restricts the scope of the employee's work. During contract negotiations, therefore, the employer should specifically ask the prospective employee whether the employee is still subject to a prior employment contract.

If the employee is not bound, then the employer should obtain a written assurance to that effect. If, however, the employee is subject to a prior employment contract, the new employer should consult with counsel to determine (a) whether and to what extent the contract does in fact restrict the prospective employee's ability to work for the new employer, (b) whether the restrictions are enforceable and (c) the manner in which the new employer should contact the old employer to discuss the scope and effect of the prior employment contract.

Absent a careful review of prior contractual restrictions on the prospective employee, the new employer and employee may find themselves subject to a suit for injunctive relief and/or damages by the former employee.

Drafting the contract

The terms and conditions in any employment contract generally depend upon the particular needs of the firm, as well as the prospective employee's scope of employment. The firm should draft the employment contract so as to protect its business interests and proprietary rights, while giving the employee a clear understanding of his obligations under the contract. The following guidelines should be considered in drafting an employment contract.

1. Protect trade secrets and confidential information through confidentiality and nondisclosure agreements. Perhaps the most important provision in any computer-related employment contract is a confidentiality and nondisclosure agreement. Under the terms of this agreement, the employee pledges to hold in confidence and not to disclose directly or indirectly trade secrets and confidential information obtained from the employer during the course of employment.

Such trade secrets and confidential information may include:

- Discoveries or inventions.
- Ideas or concepts.
- Software (object code and source code), regardless of the stage of development.
- Software documentation, including flowcharts and diagrams.
- Designs, drawings and models.
- Internal specifications and testing procedures.
- Data and data bases.
- Marketing, development and research plans.
- Novel techniques and procedures.
- Certain kinds of customer lists.
- Bidding policies and procedures.
- Miscellaneous marketing information concerning finances, pricing policies and price lists.

A confidentiality and nondisclosure agreement specifically restricts the employee from divulging to the public,

Given the frequency of job changes among professional employees at high-tech firms, an employer should know whether a prospective employee is bound by a contract with a former employer that restricts the scope of the employee's work.

Computer Interruptus

Midnight. And you wish you would be left in the dark. But miles away in the DP Department, a misplaced DD override, an invalid concatenation, or some other equally obscure JCL error brought production to a standstill.

And when the system breaks down, it's you or your staff they call up. Which usually means getting up and getting down there. And after a night like that, how productive will the morning be?

What a waste. If you had the JCLCHECK™ program, you wouldn't have JCL errors, period. None. Zilch. Zero.

Because the JCLCHECK program can catch any and all JCL errors and give you complete, on-line JCL validation and concise error diagnostics. Plus complete documentation on a job stream or entire production system suitable for insertion in the run book. And it can operate under TSO, TONE, ROSCOE or CMS.

Imagine, with no more JCL errors, your programmers can finally concentrate on what you hired them for: writing programs.

So what are you waiting for? Send the coupon or call us at (408) 554-8121 for details. We'll show you how the JCLCHECK program can bring your error detection out of the dark ages, increase production, and eliminate applications backlog. And that'll put you in the spotlight.

I'm frustrated and tired of JCL errors.
☐ Send me details on the JCLCHECK program.
☐ Have a representative call me.

particularly the employer's competitors, any information treated as secret or confidential by the employer. To qualify for trade-secret protection, the information must fulfill three criteria. First, the information must be "used in one's business" and must give the employer an opportunity to obtain an advantage over competitors who do not know or use it (Restatement of Torts, 1939).

Second, the information must be unique or not commonly known. "[M]atters of public knowledge or of general knowledge in [the particular] industry cannot be appropriated by one as his secret" (Sperry Rand Corp. vs. Pentronix, 1970). With respect to software, uniqueness requires the application of "new principles and concepts with unique engineering logic and coherence" (Com-Share vs. Computer Complex, Inc., 1971) and the expenditure of time and money for the development of new software features that provide the employer a competitive advantage.

As a practical matter, most software will be treated as unique, since any given program will involve numerous algorithms and programming decisions that vary with each programmer and result in differences in "speed, accuracy, cost and commercial feasibility . . . from system to system" (Com-Share vs. Computer Complex, Inc.).

Third, to acquire trade-secret protection for business information imparted to an employee, the employer must treat such information as secret and must bind the employee, either expressly or implicitly, to preserve the trade-secret status of the information. This will require the employer to preserve confidentiality by instituting certain programs and policies, which will be discussed in detail below.

To ensure complete protection of its trade secrets, a firm should require its nontechnical support personnel, as well as its technical employees, to sign confidentiality and nondisclosure agreements. Nontechnical or lower-level employees often have access to considerable proprietary data. Absent a specific agreement, an employer may be unable to prevent such employees from divulging trade secrets or confidential business information.

Similarly, independent contractors and visitors may acquire or have access to a firm's trade secrets. To preserve the confidentiality of such information, the firm should also require these individuals to sign confidentiality and nondisclosure agreements.

Such agreements, when carefully enforced, serve to place employees and other affected parties on notice that their jobs might involve trade secrets. The employee is therefore more likely to be "secrecy conscious" and to exercise prudence with respect to confidential matters entrusted to him. Confidentiality and nondisclosure agreements can also assist the firm in convincing its existing and potential clients that confidential information submitted to it will be protected from disclosure. The firm is therefore advised to require all prospective employees and independent contractors, as well as visitors with access to confidential information, to sign such agreements.

2. Protect trade secrets and confidential information through covenants not to compete. In addition to

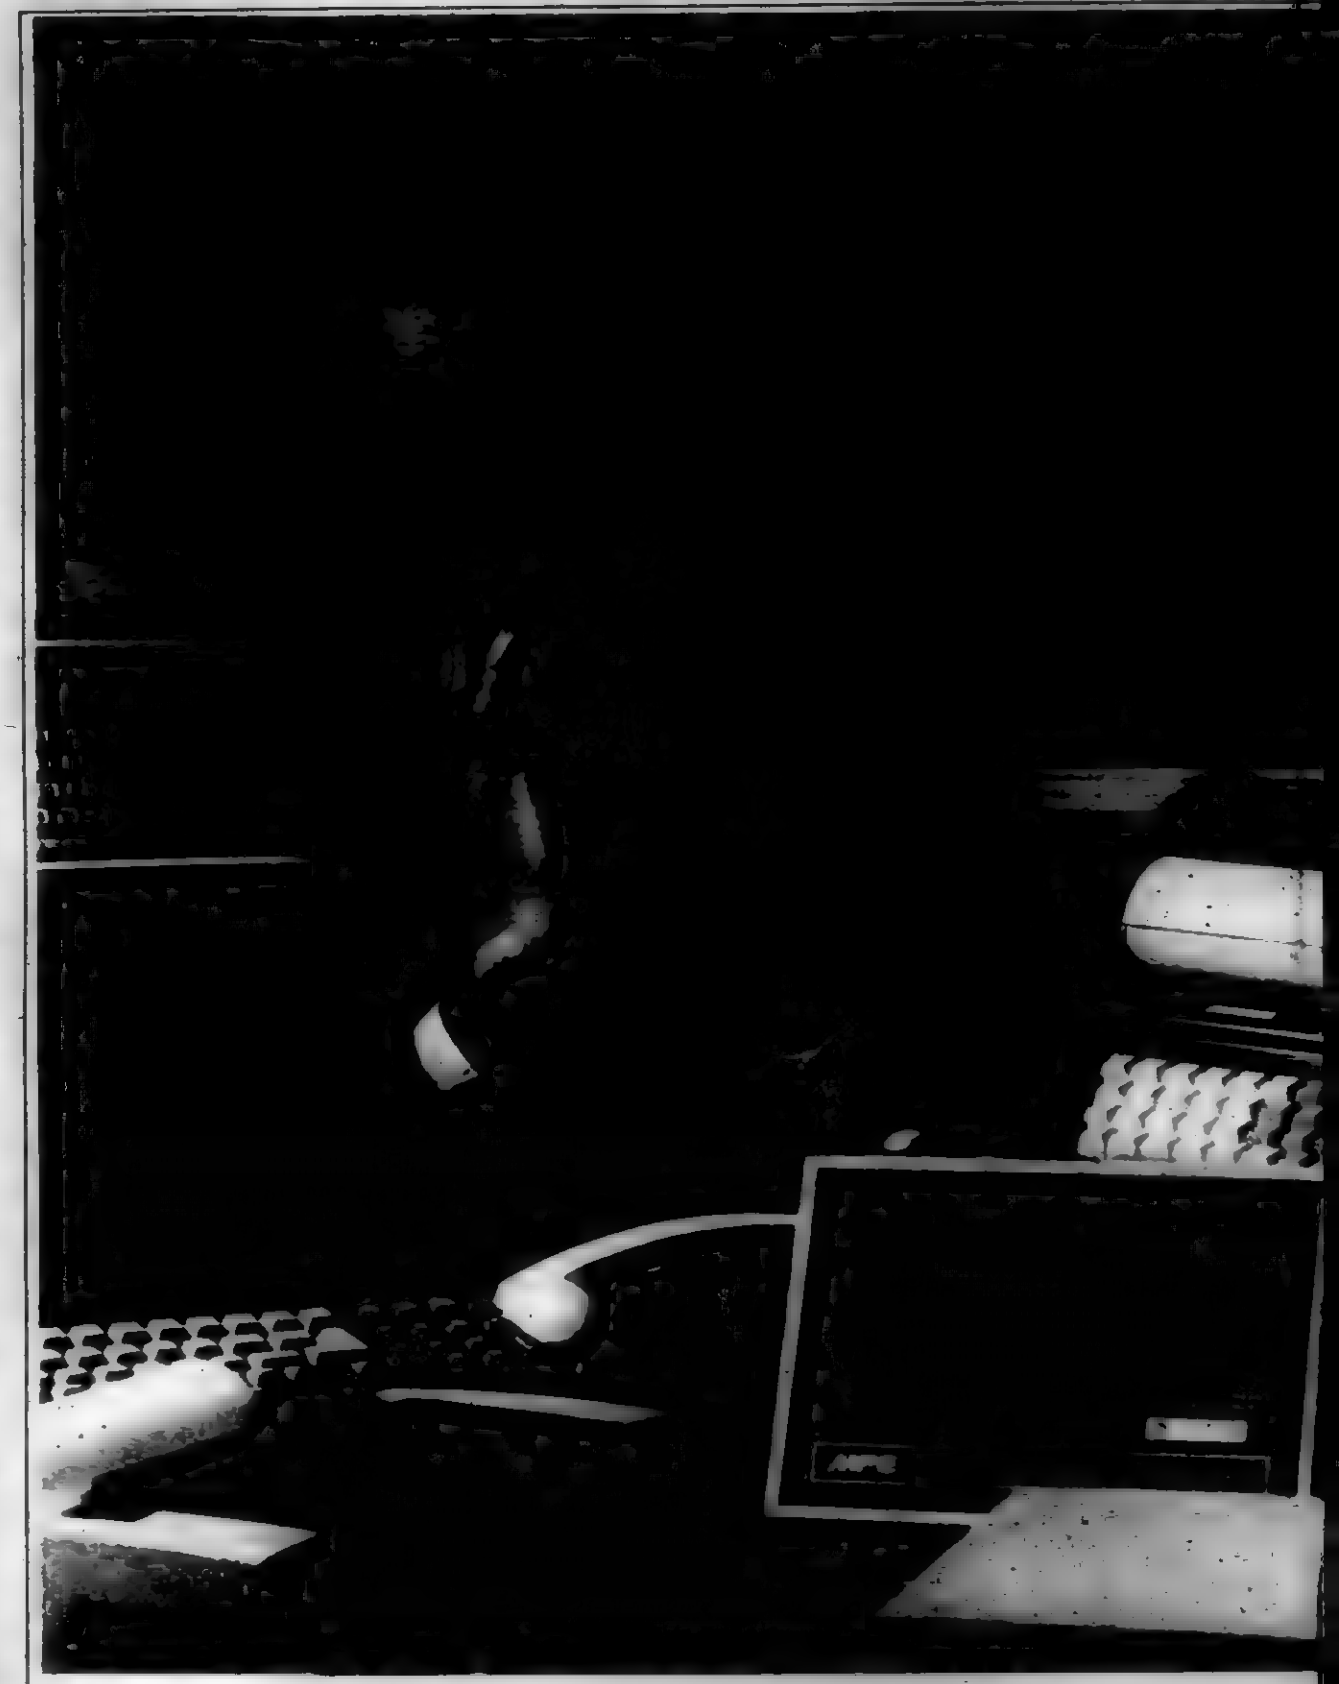
To ensure complete protection of its trade secrets, a firm should require its nontechnical support personnel, as well as its technical employees, to sign confidentiality and nondisclosure agreements. Nontechnical or lower-level employees often have access to considerable proprietary data.

demanding that employees, independent contractors and visitors execute confidentiality and nondisclosure agreements, an employer should protect his confidential information and trade secrets by requiring professional employees to sign covenants not to compete. A covenant not to compete seeks to prevent an employee with access to sensitive proprietary information from competing with or working in the same line of business as his former employer within a given geographic area and for a given period of time.

The practical effects of such a covenant are (a) to prevent the employee from directly or indirectly disclosing trade secrets to any new employer who might be in competition with the old employer, (b) to prevent other firms from "buying" confidential information by hiring employees of a competitor and (c) to prevent the employee from appropriating confidential information to start his own business.

3. Make sure the employment contract transfers to the employer the rights to all works by the employee. Under the Copyright Act of 1976, a computer program or other work prepared by an employee within the scope of his employment is a "work made for hire," and the employer or other person for whom the work was prepared is considered the author and owns all rights in the copyright.

Accordingly, absent an



employment contract that provides otherwise, copyright in all the works produced by an employee in fulfilling his duties vests with the employer. Some question, however, might arise as to whether an individual is an "employee" — under the direct control and supervision of the employer — or an independent contractor and whether work performed by an employee is within the scope of his employment. To avert any misunderstanding or confusion between the employer and the employee on these questions, the employment contract should include the following provisions, tailored to fit each employer's needs:

(i) All work by the employee or independent contractor is deemed to be a "work made for hire" to which copyright vests with the employer.

Firms should include a provision in all employment contracts restricting the employee, directly or indirectly through a family member or other person acting on his behalf, from serving as an officer, director or employee of another company without prior approval of the employer.

(ii) To the extent any work performed by the employee or independent contractor is not a "work made for hire," copyright in the work is assigned and transferred to the employer.

(iii) Copyright in any work performed during work hours (including lunch), on the employer's premises, or using the employer's facilities or money vests with and is transferred to the employer.

(iv) The employee must disclose, assign and transfer to the employer all patent and trademark rights to any ideas or inventions developed during the course of employment that involve the employer's business and products.

4. Include family members in the employment contract. Too often, computer firms fail to place any contractual restrictions on the employee's family. To prevent the improper or unauthorized use of trade secrets and confidential information by the employee and his family members, firms should include a provision in all employment contracts restricting the employee, directly or indirectly through a family member or other person acting on his behalf, from serving as an officer, director or employee of another company without prior approval of the employer. In addition, the employee should be restricted from owning an interest in any competitor of the employer, if such interest is significant enough to interfere or conflict with the employee's responsibilities and obligations to the employer.

The courts have held that such contractual provisions are reasonable and not in violation of antidiscrimination laws. In Moore vs. Honeywell Information Systems, Inc., for example, a federal district court upheld a policy restricting employees and their family members from working for or owning an interest in a computer firm's competitors. The court reasoned that where one family member, a spouse, is engaged in a competing business, "it would be perfectly reasonable to conclude that the interests of both parties will eventually intertwine, since the success of the spouse's competing business will be of a real and direct benefit to both spouses."

The court went on to note that in the computer industry, a company policy restricting family members is both reasonable and essential:

"Honeywell [the employer] is undoubtedly in possession of valuable trade secrets, such as software programs, marketing techniques, market studies and other valuable information developed perhaps at great cost to the company. The employment policy here seems to be a reasonable means to prevent the improper and unauthorized use of such information by persons or businesses which may unjustly benefit themselves with such information."

To avert any conflict of interest, therefore, a computer firm is well advised to place restrictions on family members of its employees.

5. Make sure the contract identifies a jurisdiction or forum whose law will govern.

The law governing employment and contractual relations varies from state to state. Accordingly, a firm should specify in the employment contract the jurisdiction or forum whose law will control the

ARE YOU SUFFERING FROM PERIPHERAL SCHIZOPHRENIA?

Having multiple suppliers for your data communications peripherals can pull your mind in all different directions.

You have to worry about service, about cost, about making sure you have the equipment and system you really *need*—now and in the future.

It's enough to boggle your mind.

At General Electric, we think our single-minded approach offers a higher degree of sanity.

Ah, simplicity.

Instead of multiple worries, you have one simple answer: General Electric. We begin by analyzing your needs—and likely growth pattern. Then, we help you decide on the distributive processing network system that's best for *you*.

And, since we don't have to promote a particular line or group, we'll help you build your system with components from one of the most comprehensive multi-manufacturer product selections in the business.

A sane approach to service.

You make one phone call. We have a nationwide network of over 60 service centers, including one near you.

Each not only has the service people you need, but also stocks a large selection of replacement parts, too—which usually adds up to *same day* response. In fact, we even carry the little stuff—like ribbon, paper, cassettes and discs—so you don't waste valuable space.

How our lease can cost you less.

All leases help to conserve capital and credit, eliminate obsolescence and hedge against inflation.

But with GE's service network *behind* the lease, you can help minimize *downtime*—which just could be the biggest cost-saving of all.

Help is on the way.

Shouldn't you find out more? Then call or write us now. 800-528-6050, Extension 406. (In Arizona, call 800-352-0458, Extension 406.)

The use of arbitration to resolve contract disputes between an employer and an employee is usually less expensive and more speedy than court litigation and should be considered seriously by the employer.

interpretation and enforceability of the contract. The selection of a jurisdiction should be made in consultation with counsel, based upon such factors as whether the employer and employee have sufficient contacts with the particular state and whether the governing state law is favorable to the employer.

The contract should also require the employee to consent to jurisdiction in the appropriate state(s) most convenient to the employer. In this way, if legal action must be initiated against an employee to enforce the terms of an employment contract, the employer will not be required to litigate his case in a distant jurisdiction. Courts, however, will not enforce such provisions when they are so burdensome as to be unconscionable.

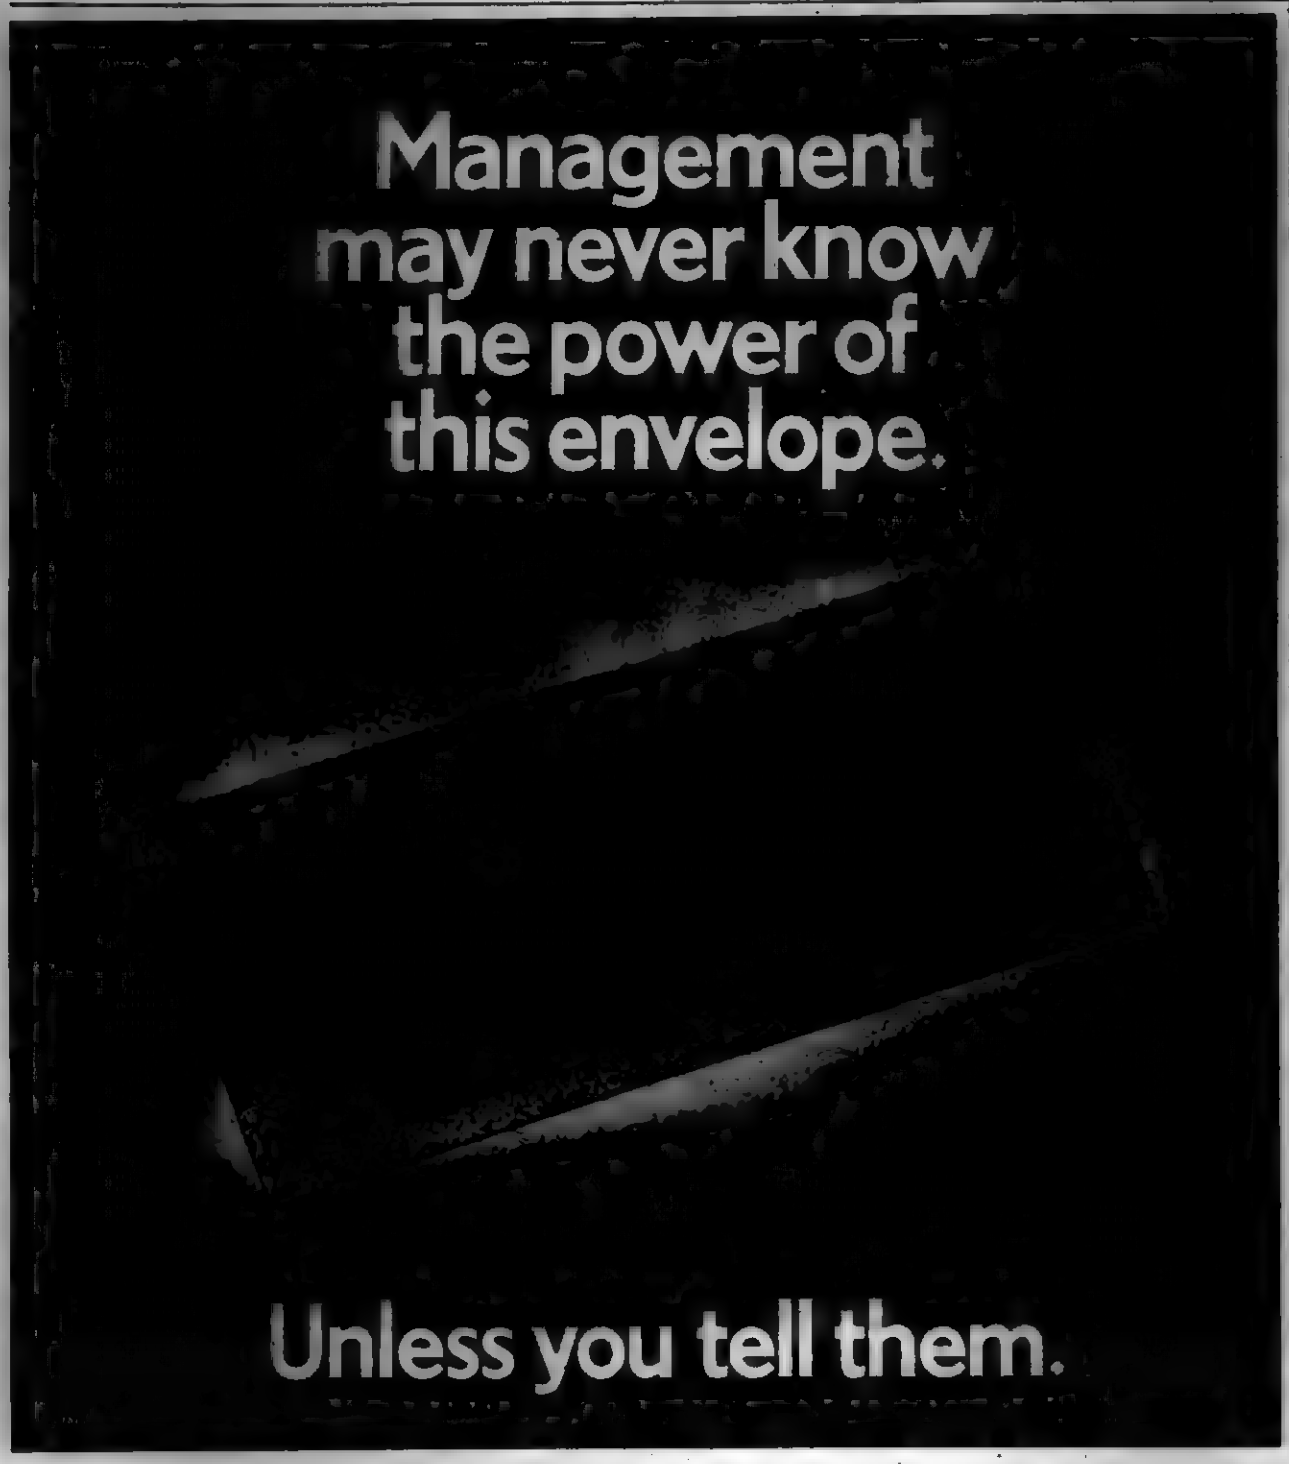
Finally, the employer might wish to require employees to submit certain contractual disputes to an arbitration board pursuant to standards and guidelines set forth in the employment contract. The use of arbitration to resolve contract disputes between an employer and an employee is usually less expensive and more speedy than court litigation and should be considered seriously by the employer.

6. Include a severability clause in the employment contract. A severability clause should be included in every employment contract. Such a clause states that every paragraph or condition in the contract is considered a separate entity and may be enforced separately, regardless of the validity of the remainder of the contract. If a contract lacks a severability clause, a decision by a court to strike one contract provision could void the entire contract. A severability clause therefore ensures that if one paragraph in the contract is declared invalid, the other paragraphs will remain enforceable.

7. Include an integration clause in the employment contract. Another provision that should be in every employment contract is an integration clause. This clause reflects the intention of the parties that the written contract is an integration of the entire agreement and constitutes the sole evidence of such an agreement. A typical integration clause reads: "The employee agrees that this contract is the complete and exclusive statement of the agreement beteen the parties, which supersedes all proposals or prior agreements, oral or written, and all other communications between the parties relating to the subject matter of this agreement."

The purpose of an integration clause is to prevent both parties from relying upon statements made prior to, during or after contract negotiations. In the absence of an integration clause, a court may be inclined to expand the contract terms by looking to the general subject matter of and the circumstances surrounding the contract, particularly if the contract is fragmentary, ambiguous or uncertain. To guard against allegations by the employee that the employer made various promises and assurances not embodied in the contract, an integration clause should be included as a standard provision.

8. Remind the employee of the legally binding effect of the employment contract. Every employment contract should end with a statement that the employee acknowledges that he has read the agreement and agrees to abide by its terms. In addition, the contract should state that it is legally



You don't have to tell management how easy it is to implement E-COM® service. That can be your secret. Tell them instead about the power of an E-COM service mailing. How letters can be sent right from the company computer. How the Postal Service prints, folds, inserts, seals and delivers these letters for you. How the distinctive blue envelopes of E-COM service lend visibility and impact to your mailing.

Since you're the one who gets E-COM service up and running, you have three options—all of them easy. First, you can write the system interface yourself. It takes about a day, and Postal Service consultants are standing by to give you any help you need. Second, you can buy a dedicated interface from a third-party vendor. Third, you can access E-COM service through an independent communications carrier, without bringing the system in-house at all.

As part of the D.P. department, you're in a unique position to tell your management about the power of E-COM service. So find out more. Call your local Postmaster. You may never again get so much credit for so little work.

E·COM

binding and that the employee has the right to consult with legal counsel concerning the contract terms. Such a provision will (i) stress to the employee the importance of the contract and the employer's intent to enforce it and (ii) place the employee on notice that an attorney may be necessary to review the contract.

Executing the contract

Execution of the contract is largely a formal, uncomplicated procedure. The employer, however, should adhere to the following guidelines.

1. Have the employee sign each page and initial important paragraphs of the contract. As a matter of policy, the employee should sign every page and initial all important paragraphs, particularly paragraphs involving confidentiality and nondisclosure agreements and covenants not to compete. This procedure will guard against any allegation that the pages of the contract were replaced. In addition, it will highlight significant clauses of the contract, thereby undercutting any claim by the employee that he did not read or was told to ignore certain important paragraphs.

2. Be careful with employment contracts with existing employees. Many high-tech firms begin as a small group efforts with "technically oriented" personnel who view attorneys as intruders in the firms' technical or business domain. This attitude has led to rude awakenings when, several years into operations, those firms realize they have no formal confidentiality agreements and covenants from their employees not to compete. The prime objective then becomes to secure such agreements at the least possible cost.

Before executing employment contracts with an existing employee, the firm should consult with legal counsel to determine whether the governing law requires that additional consideration be provided to the employee. Consideration is, in effect, something of value given in exchange for a promise. For a prospective employee, the consideration is that he will be employed and will receive a given salary and certain benefits in exchange for signing the contract and agreeing to be bound by its terms.

An existing employee who executes an employment contract, however, already has a job. Some jurisdictions have held that continued employment alone is not adequate consideration for an existing employee who is required to sign an employment contract containing restrictive covenants.

If an employment contract with an existing employee is governed by a jurisdiction that requires additional consideration, the employer should provide some benefit to the employee in exchange for his signing the contract. The benefit could be a small cash bonus, a salary increase or a job change. To ensure that no additional sums are spent, the firm could require existing employees to execute contracts prior to annual salary adjustments and treat the increase in salary as consideration for the contract.

Enforcing the contract

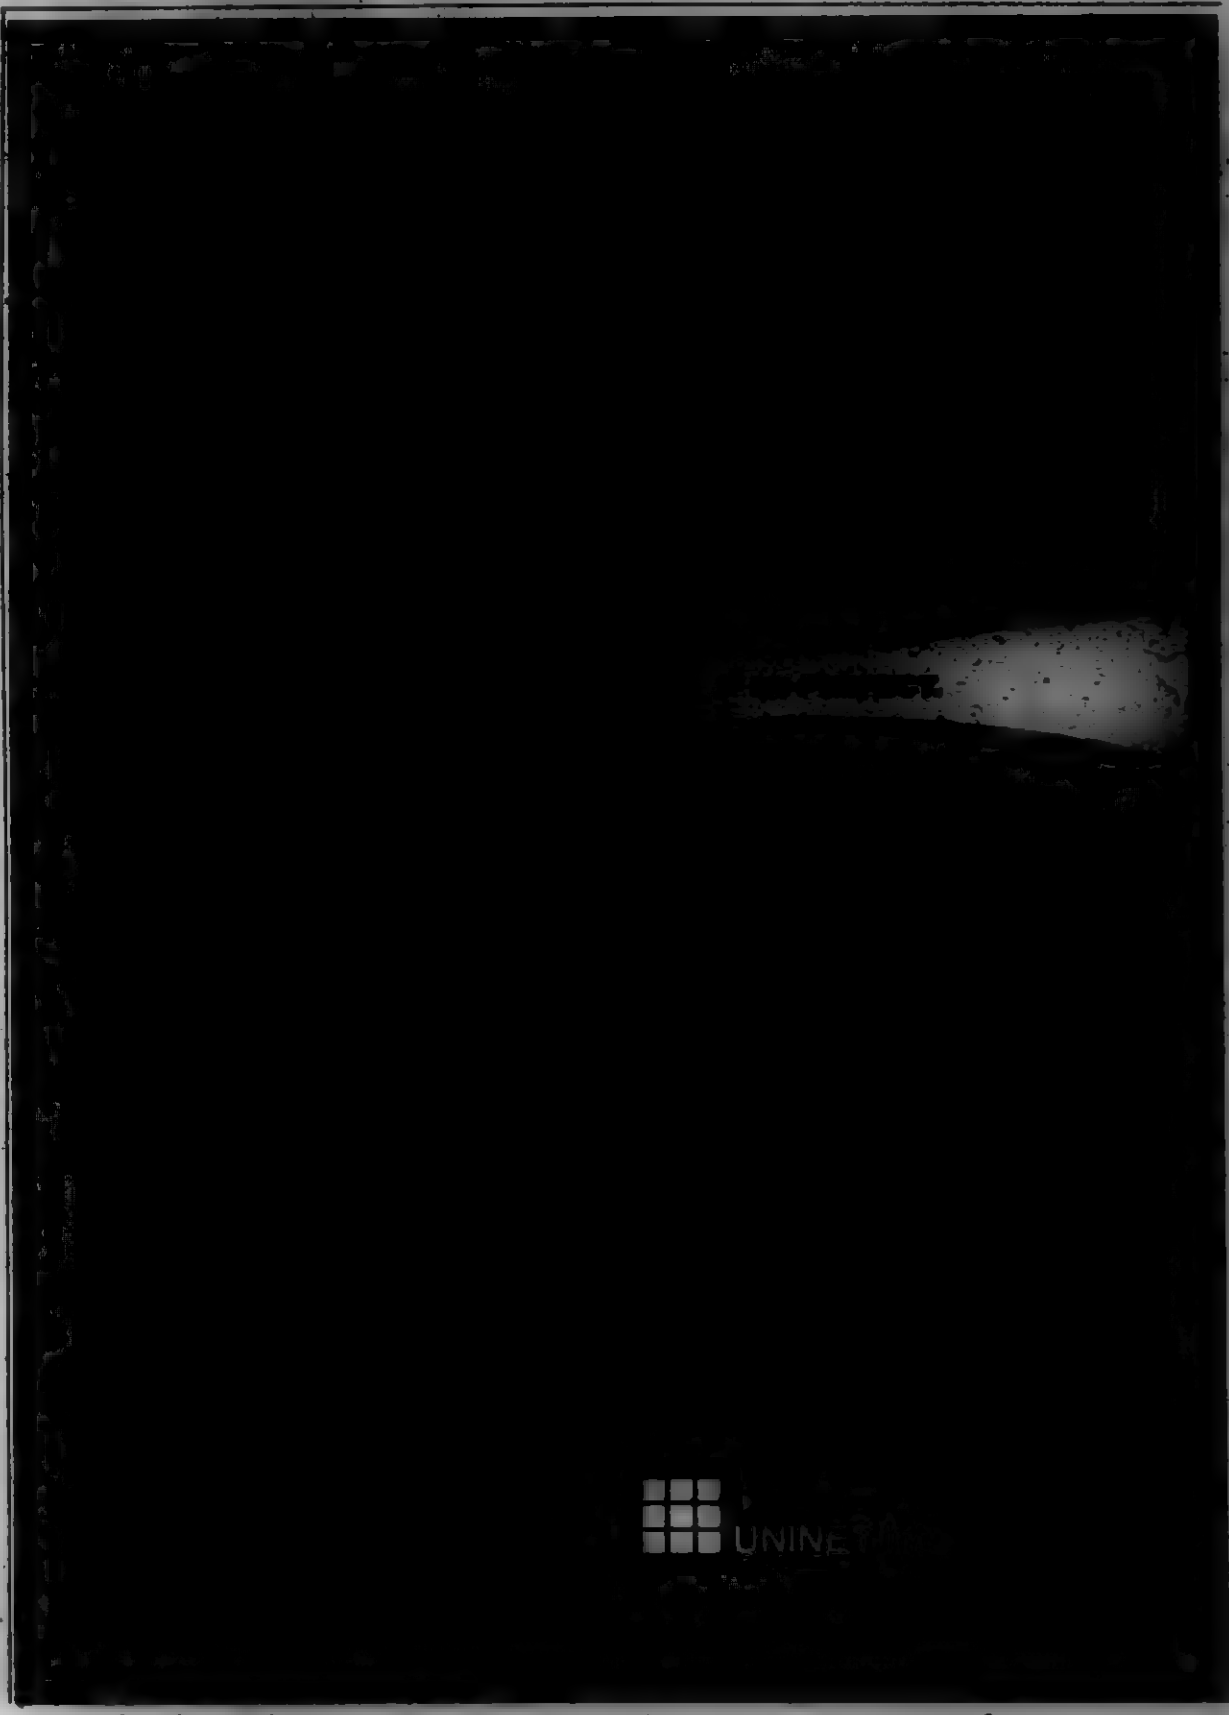
Most employees will abide by the restrictions in their employment contracts. In some instances, however, the firm will be required to enforce its contracts to ensure compliance by its employees. In this regard, a firm must be willing to take legal action when necessary and to implement certain in-house procedures to protect its interests.

1. Make sure the departing employee submits to an exit interview. Whenever an employee terminates his employment, an exit interview should be held to remind the employee of his obligations under the contract. Specifically, the interview should stress the importance of maintaining the firm's confidential information and trade secrets and should remind the employee of any covenants not to compete against the employer.

The employer also should require the departing employee to execute a termination agreement acknowledging obligations and restrictions set forth in the employment contract. Naturally, an employee's unwillingness to sign such an agreement will cast serious doubt as to whether the he will preserve the employer's trade secrets and otherwise comply with the employment contract.

2. Establish in-house policies regarding the use and disclosure of trade secrets. As discussed above, trade-secret protection for business information is available only if the employer makes efforts to maintain such information as secret. Accord-

Many high-tech firms begin as a small group effort with "technically oriented" personnel who view attorneys as intruders in the firms' technical or business domain. This attitude has led to rude awakenings when, several years into operations, those firms realize they have no formal confidentiality agreements and covenants from their employees not to compete.



MANUFACTURING MANAGEMENT SOFTWARE FOR HP3000

ingly, the firm must implement stringent security procedures and monitor compliance with such procedures. The following suggestions may be helpful to the firm seeking to maintain the confidentiality of its business secrets:

(i) Limit access to computer programs and proprietary business data on a "need-to-know" basis.

(ii) Limit access to sensitive areas to approved personnel only. Keep such areas segregated and locked securely.

(iii) Institute proper sign-out procedures in tape libraries. Restrict access to such libraries to designated individuals.

(iv) Place terminals with access to confidential data in segregated and safe areas. Use passwords or keys to limit access to highly sensitive files. Make sure passwords and keys are changed periodically.

(v) Monitor all copying of software, manuals and other confidential documents.

(vi) Dispose of paper, tapes, notes and other trash carefully.

(vii) Periodically instruct all personnel regarding security precautions. Post warning signs and security notices when appropriate.

(viii) Exclude all terminated employees from access to confidential data. If an employee leaves on bad terms, take further precautions such as changing terminal passwords and keys.

(ix) Label all confidential information as "SECRET AND CONFIDENTIAL." Each page of proprietary computer printouts should also be labeled confidential.

(x) Instruct employees not to leave confidential data unattended.

(xi) Monitor and review all speeches and publications to ensure that employees do not divulge trade secrets and confidential data.

(xii) Periodically review the security program in effect at the firm.

2. Remember that covenants not to compete provide only limited protection. The firm should realize that covenants not to compete do not provide unlimited protection against former employees. Indeed, the courts have placed various restrictions on the enforceability of such covenants. As discussed earlier, some courts require the employer to give additional consideration to an existing employee who agrees not to compete against the employer. In addition, covenants that place unduly restrictive limitations as to subject matter, geographic area or time will not be enforced.

Courts either will revise such covenants so as to protect equitably the interests of both the employer and employee or will strike the covenants in their entirety. Accordingly, the employer is well advised not to be overly greedy in efforts to restrict an employee's job mobility.

Finally, in some jurisdictions, all covenants not to compete are deemed to be void as a matter of public policy. The employer should therefore consult legal counsel to determine the law.

4. Be willing to enforce employment contracts to let the employees know you mean business. The firm should be willing and able to enforce its employment contracts for two reasons. First, active enforcement will alert other employees that their employer fully intends to hold them to their employment contracts. Second, selective enforcement or nonenforcement of restrictive covenants may undermine their effect. A court may conclude that the employer is not entitled to protection since other employees were allowed to violate their restrictive covenants. The employer should therefore initiate a policy of regularly enforcing restrictive covenants.

Only when a firm follows proper procedures in negotiating, drafting, executing and enforcing its employment contracts will it receive the necessary protection under law.

About the Author

Tobey Marzouk is an attorney with the law firm of Spriggs, Bode & Hollingsworth in Washington, D.C., where he specializes in computer law and federal court litigation. He serves on the board of advisors of the Computer Law Reporter.

No other 3270 protocol converter can match all these features.

Since 1977, hundreds of companies all over the world including Bell Labs, Citicorp, ITT, Litton, Westinghouse—have used Local Data products to make IBM communications easy and inexpensive.

We believe the DataLynx™/5274 is the best price/performance 3270 protocol converter on the market.

So, before you buy any other protocol converter at any price, compare the DataLynx/3274 features first. Then decide.

- SNA/SDLC or BSC protocols supported. SNA is PU type 2.
- BSC for EBCDIC and ASCII.
- 16 bit, 8 MHZ Intel 8086-2 CPU.
- Auxiliary printer support allows each async port to have a separately addressable 3287 type printer. This feature enables dial users to combine CRT and print data over one dial-up line.
- 80 types of ASCII async display terminals can emulate IBM 3278 display stations, and ASCII async printers to emulate IBM 528X printers.
- Micro to main-frame support with our FileLynx™/3278 program for the IBM PC and PC compatibles supports terminal emulation and file transfer (upload/download).
- Hard copy KSR support with our "Paper/3278".
- Unique "paging" feature supports emulation of *all* models of the 3278 display station.
- Pseudo-transparency feature allows host application to transmit character and control codes to async terminal devices (e.g., graphics terminals, graph plotters, mini-computers, high-speed printers with down-loadable forms control units).
- "Compu" support for micro, mini and instrumentation computers as terminal devices.
- Dual host support.
- PROM cartridge for easy user upgrade of firmware.
- Powerful, friendly configurator mode, using menus to allow parameter definition for sync ports, logical units, async ports and terminal characteristics, including help utility.
- Configuration values saved in non-volatile EEPROM.
- Monitor mode displays current status of all ports and logical units.
- May be connected to a host directly (in modem eliminator mode), or via modems on a dedicated multipoint or point-to-point line (dial-up or dedicated), via RS-232C sync ports.
- Data rates to 19,200 bps (sync & async).
- Async ports may be configured for any of 15 fixed bit rates or "autobaud", with or without parity checking, and with a specified character format.
- Simple DTE/DCE change on all ports.
- Flow control on async ports may be configured for physical and/or logical signalling.
- Virtual device support enables reconnect of dial users independent of physical port.
- Security through dual level password protection.
- Emulation of standard 3278 keyboard functions is tailored for each supported terminal type.
- 25th status line emulation.
- SAS graphics support.
- Base color support.
- 3278-5 (27 x 132 character screen) support on 9 channels with memory expansion option.
- LU configurator options provide support for various screen formats and printer page widths.
- Front panel includes 33 function status indicators.
- Self-test of channels, memory and firmware integrity is performed continually in background mode assisted by a "watchdog" timer.
- UL and FCC approved.

For more information about the remarkable DataLynx/3274 protocol converter, call or write today. And ask about our 30-day free trial program.

IN DEPTH

The law of the industry, 1984

By Richard Raysman

The number of computer-related lawsuits jumped dramatically in 1983, and most were overlooked by the national press. Yet their outcomes mean much to the vendor and user communities as well as their attorneys.

The more well-known computer-related lawsuits of recent years have been analyzed at length — Glovatorium vs. NCR Corp., a user/vendor case; Apple Computer, Inc. vs. Franklin Computer Corp., a test of software copyright protection; and Computer Systems Engineering, Inc. vs. Qantel Corp., a distributor/vendor dispute.

But many other legal decisions in the industry were overlooked by the national press in the past year. The dollar amounts involved may have been relatively small or the trial locations far from the legal limelight of New York, California, Illinois and Washington, D.C. Nevertheless, these decisions can set precedents, thus influencing the way companies must do business.

The most common computer-related lawsuits involve a dissatisfied user filing suit against a vendor. The frequency of such suits has increased along with industry expansion and systems expenditures.

Cases in which one vendor sues another are becoming more common and may overtake

CW PHOTO BY GEORGE HIRAMA

Honeywell computers help Trailways move over 20 million people a year at the touch of a button.

Trailways faced a challenge recently. They wanted to improve cash management, the accuracy of pricing and scheduling, and the efficiency of their terminal operations.

So they came to Honeywell, and together we worked out a solution based on our microSystem 6/10. Now, at the touch of a button, ticket agents can see schedules, routes and rates for thousands of Trailways' destinations. The possibility of error is all but eliminated. The system even prints the tickets automatically.

Trailways' managers will benefit by having faster access to data. For example, the system facilitates interline accounting and furnishes feedback on marketing campaigns—a critical edge in a newly deregulated environment.

What's more, the microSystem 6/10 is easy to use, easy to program, and compatible with the Honeywell minicomputer and mainframe host at Trailways' home office. (Only Honeywell has total instructional set compatibility for micros, minis and mainframes.)

The microSystem 6/10 has 512K of memory. More than enough to handle the vast amounts of rate/schedule data Trailways must store, as well as information on daily transactions.

And the system is a snap to install, reliable, and backed up by Honeywell's nationwide service organization.

Information control. That's what keeps Big Red rolling.

For more information on the microSystem 6/10 and the advantages of full-line compatibility, call 800-328-5111, ext. 2708 (In Minnesota, call collect 612-870-2142, ext. 2708) or write Honeywell Inquiry Center, 200 Smith Street (MS 440), Waltham, MA 02154.

Together, we can find the answers.

Honeywell

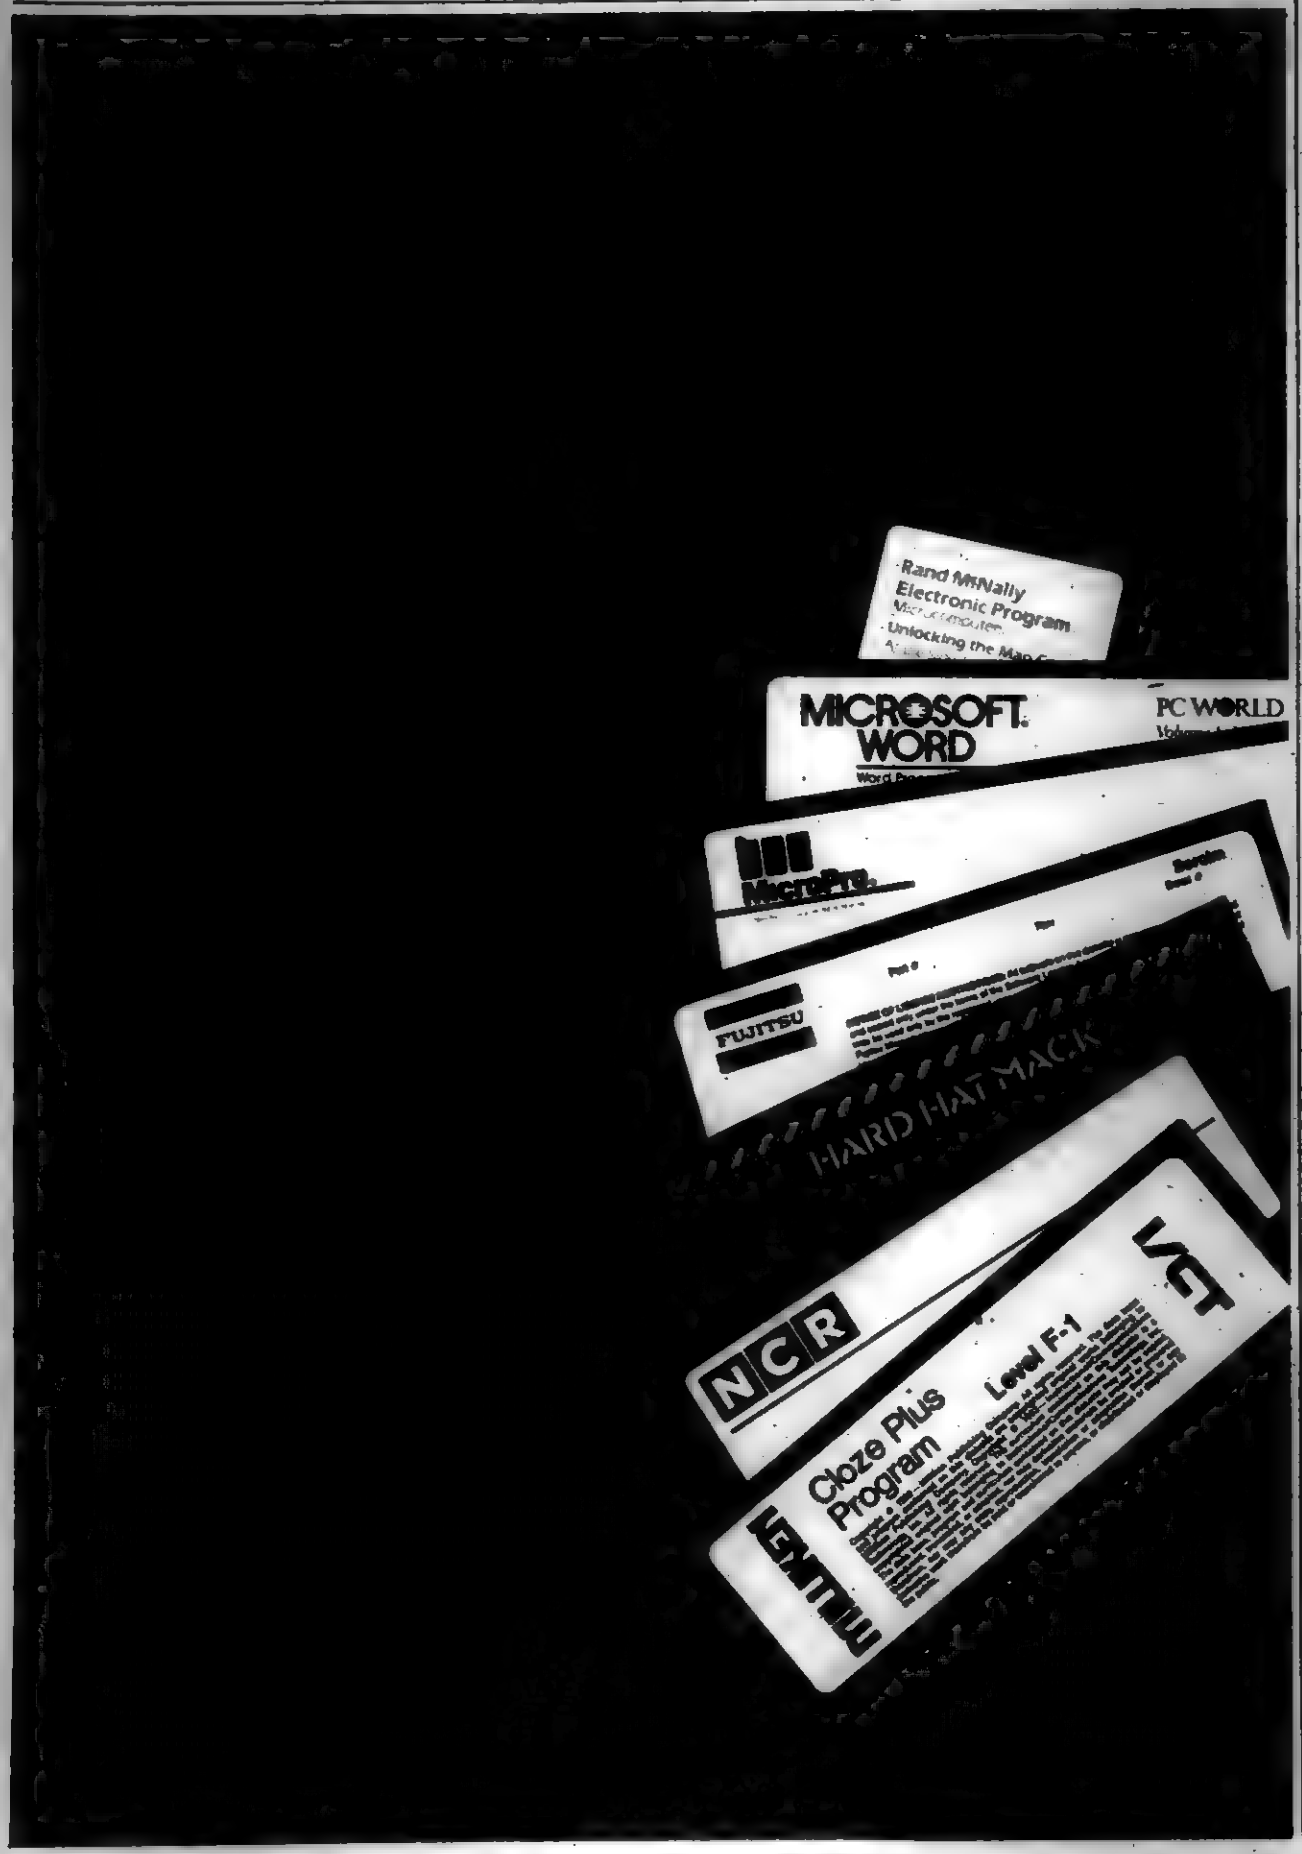
user/vendor lawsuits in importance. Usually, more money is involved in vendor/vendor litigation, and a small vendor's business may be at stake. A user typically sues a vendor over a specific transaction. Its business may also be at risk in cases where it must endure extreme delays or systems malfunctions resulting from actions of the vendor.

The lawsuit of Burroughs Corp. vs. Century Steel, Inc. is a good example of the troubles that can occur when a buyer of computer goods and services negotiates with the primary manufacturer but then finances the purchase of the equipment through a third-party leasing company. If difficulties subsequently transpire, the primary manufacturer will often claim that there was no "privity" of contract.

Without privity of contract, the primary manufacturer takes the position that the purchaser had no direct contractual relationship with the primary manufacturer, and therefore the primary manufacturer has no legal obligation toward the purchaser. If the legal concept of privity of contract is upheld by the courts, the primary manufacturer effectively insulates itself from legal obligations in any situation where a computer purchaser has financed the equipment through a third-party lessor.

Century Steel negotiated the purchase from Burroughs of a minicomputer and accompanying software. Burroughs agreed to deliver and install a workable software system to Century Steel. Since the buyer required financing, it negotiated a lease of the equipment for 60 months from a leasing company. In less than a year after the lease agreement was signed, it became apparent that Burroughs was unable to install the computer and software. Century Steel thus moved the Burroughs equipment out of its office to a warehouse and had another installed.

Subsequently, the leasing company filed a lawsuit against Century Steel for nonpayment of rent. Century Steel then cross-claimed against Burroughs, setting forth the legal position that if the leasing company were successful in its complaint against Century Steel, then Burroughs should be responsible for paying the judgment to the leasing company.



If the legal concept of privity of contract is upheld by the courts, the primary manufacturer effectively insulates itself from legal obligations in any situation where a computer purchaser has financed the equipment through a third-party lessor.

The trial court's decision, which was subsequently upheld in appeals court, determined that Century Steel was entitled to recover from Burroughs all of the rental payments paid by Century Steel to the leasing company.

The legal position of Burroughs, which was not upheld by the court, was that there was no privity of contract between Burroughs and Century Steel. Burroughs claimed that the equipment was sold to the leasing company, which, in turn, leased the equipment to Century Steel, and that Burroughs and Century Steel had no legal relationship. However, there were two equipment sales contracts signed by Burroughs and Century Steel, and those contracts were subsequently sold by Burroughs to the leasing company.

In making its decision, the trial court took into consideration that the leasing company did not make any representations or warranties with respect to the condition of the equipment and did not assume any liability for loss or damage resulting from delays of delivery or installation of the equipment.

Further, in the lease agreement, Century Steel received the benefit of any of the Burroughs warranties with respect to the agreement. The equipment was shipped and installed by Burroughs. Technical employees of Burroughs worked on the installation of the software at Century Steel's location.

The Goal News

LOGICAL beats PHYSICAL

For OS/VS

LOGICAL DUMP/RESTORE OFFERS VAST PERFORMANCE GAINS

We are pleased to report that the people who have tried FAVER/XP, the "smart" backup/restore system, are pleasantly surprised at the difference Logical makes.

Most people are used to a physical-design dump & restore system. To backup a single dataset across a number of packs, they have to physically back up each pack. The logical approach of FAVER/XP lets the system back up just the dataset you want, no matter how many volumes it occupies.

You can back up clusters, groups of clusters or an entire catalog this same way. It's much easier with FAVER/XP and everything happens faster.

Plus, FAVER/XP integrity-checks all VSAM datasets for errors before it backs up anything. If it finds anything, you know about it. If everything's OK, the backup runs automatically. You can rest easy that your backups are clean.

Just to be sure, though, you can invoke the COMPARE function to ensure that the backup tape contains exactly the same data as the disk.

Works with VSAMAID/XP for total VSAM management

Goal Systems International has revealed that they have an interface between the FAVER/XP Backup & Restore system and the VSAMAID/XP system which creates the only complete VSAM dataset management system available today.

During backup, the FAVER/XP special interface creates a historical file, which may then be used by VSAMAID/XP to create a "reconstitutions report" tape, ensuring

Begubb ip tgere. T svvribat vtrayn i zybirt nrfuva vaydr' cukir dyvs ygrqp cguv' kst' abt' jtun

FAVER/XP beats IDCAMS

In benchmark tests where an OS/VS installation runs backup & restore routines using IDCAMS and FAVER/XP, FAVER/XP completes the tasks required in half the time.

These figures are taken from actual timings made by product managers at Goal Systems International, the authors of FAVER/XP. They cover 100 product installations spanning five years of operation.

"The difference in speed is due to a systems design that combines the speed of a physical dump/restore with the

Users amazed at the difference

When polled by this newspaper, users of FAVER/XP revealed that the Logical approach to backup & restore is genuinely faster, more accurate, and easier to perform.

Ralph T. Bryan, Systems Manager at Turbo Rubber Company said, "Here we had been operating all these years working our tails off just to do an accurate backup & restore. And FAVER/XP comes along and automates the task. It's about time."

FAVER/XP and VSAMAID/XP are great news for OS/VS installations. They are two of the Extended Productivity Systems from Goal Systems International. Both are available for a free trial. Call Goal Systems toll free today.

The trial court also found that the equipment sales contract that had been signed between Burroughs and Century Steel had not been abandoned or rescinded by mutual agreement and, thus, there was privity of contract between the two. The appeals court recognized that there was substantial evidence and support of the finding that Burroughs failed to deliver properly and install a workable software system.

The award in favor of Century Steel was upheld. But Century Steel had to endure litigation for more than five years.

When third-party financing is involved, a computer user can help to avoid claims of no privity of contract by making sure that there is a signed agreement directly with the primary manufacturer of hardware or the primary supplier of software. Then, if the system is not properly installed, the primary supplier cannot claim at a later date that there was no legal relationship with the end user.

Claims of fraud

Fraud claims have always been a serious threat to computer vendors because of the risk of substantial punitive damages associated with the final award. In Dunn Appraisal vs. Honeywell Information Systems, Inc., a trial with a judge and no jury, the judge awarded not only compensatory damages but also punitive damages plus attorneys' fees. This decision was unusual in that most often, punitive damages are awarded in jury decisions.

Dunn Appraisal was engaged in the automobile damage appraisal business. In 1975, Dunn was using an older Honeywell model computer and desired to upgrade its equipment. Over a period of almost one year, two sales representatives from Honeywell persuaded Dunn executives to upgrade to a newer model Honeywell computer.

One of the principal issues in the discussions between Dunn and Honeywell was that of program conversion. Approximately 400 programs were involved. Honeywell representatives understood that a successful conversion effort would take two to four man-years to complete.

Nevertheless, Honeywell sold the system to Dunn, assuring the company that Honeywell would convert all of the programs at no charge. Although there were 400 programs, the Honeywell representatives specified only 250 programs in the written agreement, assuring Dunn orally that the lower number was inserted simply to satisfy the Honeywell front office and that Honeywell would, in fact, convert all programs.

The trial court found that a relationship of trust and confidence existed between the parties. The Dunn situation is a good example of a fact pattern for a fraud claim: Dunn representatives were relatively unfamiliar with computers and relied primarily on Honeywell representatives for advice and guidance.

The trial court found that almost from the beginning, the conversion project was an "unmitigated disaster." After a period of time, Honeywell informed Dunn that it would not convert all of the programs, only the 250. Dunn was forced to hire an independent contractor to complete the job. Even after the deadlines had passed, Honeywell had not delivered all of its 250 programs. Many that had been delivered were incorrect.

After almost a year of attempting to perform the conversion, Dunn could not use either its old machine or its new one to conduct business. The trial court characterized the conversion effort as a "botched-up mess." Finally, Dunn terminated the agreement.

The trial court found that Honeywell had made material misrepresentations to Dunn in order to induce the company to enter into the contract. The misrepresentations included saying the Honeywell computer was best suited for the Dunn operation, that delivery and installation could be completed within three months and that conversion of the 400 programs could be accomplished with minor modifications and little or no disruption of Dunn's business. Other misrepresentations were that the new computer would improve Dunn's efficiency in serving its customers and that transition to the operation of the new computer could be accomplished without additional formal training or labor costs.

The judge in the trial court awarded Dunn $61,573 in compensatory damages, $30,758 in punitive damages plus attorneys' fees of $24,628. This award was upheld on appeal.

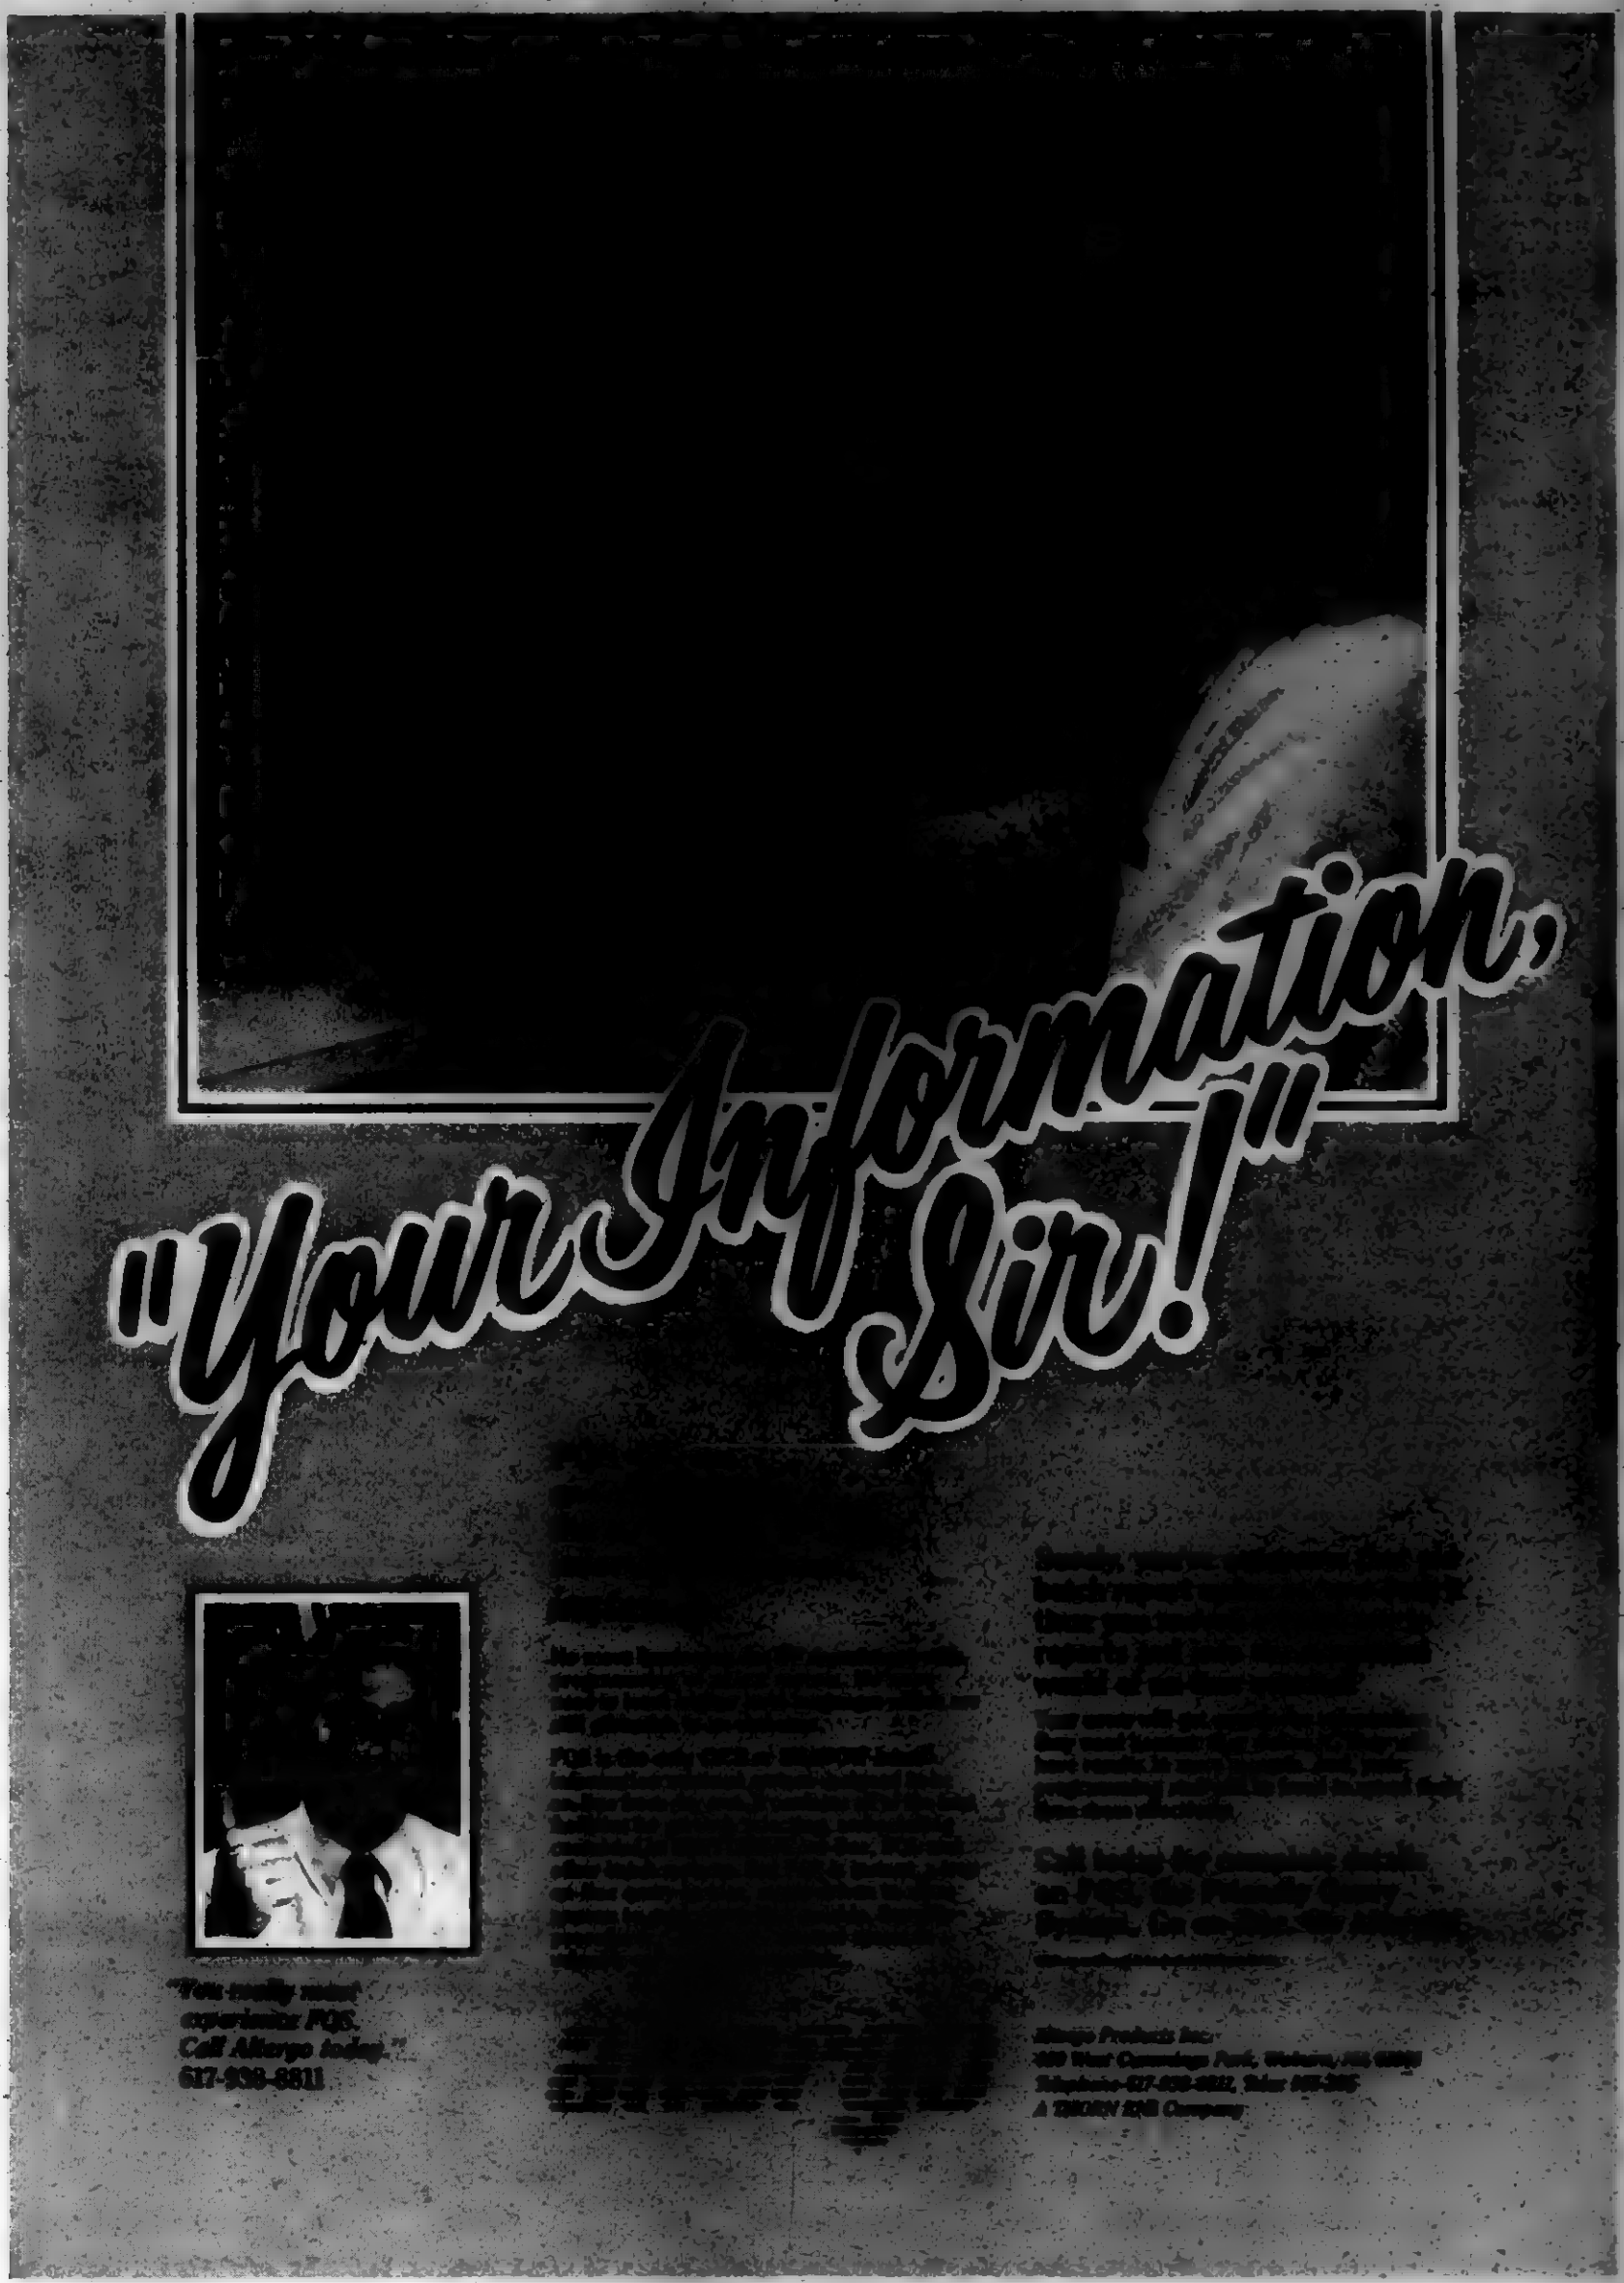
The Dunn result illustrates emerging trends in user/vendor litigation. Punitive damages were awarded and upheld, even though there was no jury involved; attorneys' fees were awarded by the court; and the court allowed compensatory damages for lost executive time. The trial court found numerous items of misrepresentation and good-faith reliance by the purchaser upon false and misleading statements made by the vendor.

Conversely, now that many computer purchasers are becoming more sophisticated in their knowledge, claims of fraud may not be as believable since the users are not relying as significantly on the vendor's representations as they have in the past. Many users are retaining independent consultants. Where users retain competent technical assistance, a fraud claim would be much more difficult for them to prove.

OEM/manufacturer relations

Not infrequently, small OEMs have difficulty entering into volume discount arrangements with primary manufacturers. The manufacturers

THOUSANDS OF SOFTWARE PROGRAMS ARE GATHERING IN NEW ORLEANS.
SOFTCON
SOFTCON EXHIBITORS



"Information, Your Sir!"
"You really must experience PQS. Call Allergo today."
617-938-8811

sometimes are understandably reluctant to become involved with OEMs who may be undercapitalized or poorly managed. As the computer industry continues to mature, manufacturers would rather do business with established OEMs and reduce involvement as much as possible with new ventures. Conversely, small OEMs just starting in business desire the opportunity to enjoy a mutually profitable relationship with the primary manufacturers.

An example of an initial relationship which did not develop amicably between a manufacturer and an OEM is described in the lawsuit Management Assistance, Inc. vs. Computer Dimensions, Inc. vs. Basic Four Corp. Computer Dimensions, a Georgia corporation in the business of designing, manufacturing and marketing computer systems and related components, desired to obtain from Basic Four a multiple system discount contract for the sale of computer systems in a dealership agreement. There were numerous discussions between representatives of Computer Dimensions and Basic Four. The only signed written agreements were purchase agreements where Computer Dimensions agreed to buy certain computer hardware and peripherals from Basic Four. After a dispute arose between Computer Dimensions and Basic Four, there was a subsequent supplemental agreement where Computer Dimensions agreed to pay Basic Four $10,000 in exchange for releasing Basic Four from any liability and delivery by Basic Four to Computer Dimensions of certain computer equipment.

There were also volume discount purchase orders signed by Computer Dimensions but not by Basic Four — thus, not mutually agreed written agreements. Basic Four sued Computer Dimensions for payment, and Computer Dimensions counterclaimed that Basic Four had fraudulently induced it to sign the settlement agreement. Computer Dimensions claimed that Basic Four had given oral assurances that after signing the settlement agreement, Computer Dimensions would become a Basic Four OEM dealer and could immediately start selling the Basic Four systems.

The court held that any reliance by Computer Dimensions on oral representations was unreasonable when the settlement agreement expressly released Basic Four from any liability and that Computer Dimensions was not prevented from reading the contract. The court seemed to take a rather impatient view of the claims by Computer Dimensions that in this vendor/vendor arm's-length negotiation, it was somehow induced to sign an agreement it did not understand. As a result, in a lengthy opinion, the court dismissed the Computer Dimensions claim of fraud.

This lawsuit is a good example of the difficulty that manufacturers and OEMs face in the coming years. OEMs should be careful that they do not rely solely upon oral assurances made by manufacturer representatives. When OEMs enter into bona fide written agreements with the manufacturer, the OEM should be certain to get a fully signed copy of that agreement before marketing the equipment to end users. Conversely, manufacturers, in order to avoid claims of fraud, should avoid letting OEMs think that they have a formal relationship with the manufacturer prior to the signing of a comprehensive written agreement.

When third-party financing is involved, a computer user can help to avoid claims of no privity of contract by making sure that there is a signed agreement directly with the primary manufacturer of hardware or the primary supplier of software. Then, if the system is not properly installed, the primary supplier cannot claim at a later date that there was no legal relationship with the end user.

Video games

The developers of video game cartridges have been fighting vigorously for the last several years to protect their products. Most of the lawsuits have been based upon copyright infringement claims against companies that have developed imitators to such video games as Pac-Man.

One of the more recent video game lawsuits, Atari, Inc. vs. JS&A Group, Inc., involves a dispute other than a game imitation. Atari game cartridges contain a silicon chip with read-only memory (ROM). Atari has copyrighted its video games as audiovisual works.

JS&A is a retailer of electronic products. The lawsuit involves a JS&A new product called Prom Blaster, a device that can duplicate video games. The JS&A advertisement states that "you simply plug in your Atari or Activision in one slot and a blank cartridge in another, press a button and three minutes later, you've created an exact duplicate." The Prom Blaster sells for $119.

JS&A claimed that the Prom Blaster was used primarily as a means of backing up copies of Atari 2600 compatible games. It was Atari's

FOR THREE DAYS IN TEXAS WILL TURN

No single computer, personal or otherwise, has so profoundly affected all of business and industry as the IBM Personal Computer.

And now, for three days only, you can see, touch, use and compare the hardware, software, peripherals and compatibles that run on, like or with this revolutionary machine. It's the PC *World Exposition* in Houston, and you are invited to join us.

You'll see hundreds of exhibits from all the product leaders. Both makers and marketers of hardware, software, printers, peripherals, add-ons and services in a giant exhibition and retail selling event. Here's a list of some of the product leaders you'll see:

(Exhibitors as of Dec. 15, 1983)

contention in the lawsuit that the purpose and effect of the Prom Blaster was actively to induce and materially contribute to making infringing copies of Atari's copyrighted home video games. Atari sought a preliminary injunction to prevent JS&A from selling or distributing the Prom Blaster together with blank cartridges.

The court decided that it was not enough for JS&A to show that the Prom Blaster had a legal use such as backing up cartridges. The court determined that the Prom Blaster machine must have a substantial noninfringing use to avoid granting an injunction against its sale. The court determined that the primary and only substantial use of the Prom Blaster was the duplication of video games developed by companies other than JS&A. Thus, JS&A was likely to be held liable as a contributory infringer.

The Consolidated lawsuit is indicative of the serious difficulties that can occur between a manufacturer of computer equipment and its distributors. The maturing computer industry is now experiencing the manufacturer-distributor difficulties long common in other industries.

The court found that the archival argument was not valid since the tapes could only be destroyed by a mechanical or electrical failure but could not be reprogrammed or erased. As a result, the court granted a preliminary injunction in favor of Atari and against JS&A and enjoined JS&A from selling, marketing, distributing or otherwise disposing of the Prom Blaster.

The Atari lawsuit involves a novel approach to copying copyrighted video game programs. This decision is added to the already existing cases that prevent imitators of video games from infringing on copyrighted works.

Distributor, manufacturer

Virtually all computer and peripheral manufacturers currently market at least some of their products through distributors. Since the value of the equipment is often significant, disputes between manufacturers and their distributors are more frequently ending up in the courts.

A 1983 case between a distributor and a computer manufacturer where punitive damages were awarded by the trial court is Consolidated Data Terminals vs. Applied Digital Data Systems. The total award for Consolidated at the trial level was $585,489, which included $500,000 in punitive damages. The Ninth Circuit Court of Appeals reversed most of the award of the lower court including the $500,000 in punitive damages. Nevertheless, this lawsuit is illustrative of the risk to computer manufacturers in dealing with their distributors. It should also be noted that the punitive damage award was granted by a judge and not a jury.

Applied Digital Data Systems (Adds) was a manufacturer of CRT terminals. Consolidated Data Terminals (CDT) was a distributor of the terminals in California. Adds and CDT signed a written distributor agreement making CDT a nonexclusive sales outlet for Adds terminals. Adds promised to accept CDT purchase orders for a fixed price, and CDT promised to use its best efforts to promote Adds' product.

CDT further promised that it would not sell other competitive terminals. Adds subsequently began delivering terminals that did not meet their published specifications in Adds' promotional literature. In particular, the terminals would not operate at the advertised speed of 1,920 char./sec, and as many as 25% of the terminals were totally inoperative upon delivery.

Eventually, CDT bid on an order for 127 terminals to Intel Corp., a terminal user. Adds bid on the same project but came in at a higher price. When Adds discovered the lower CDT price, Adds reduced its asking price and was awarded the final contract to supply the terminals. When CDT learned of this undercutting action by Adds, combined with the technical difficulties of the Adds terminals, CDT terminated its distributor agreement with Adds and entered into distributor agreements with other terminal suppliers.

CDT then filed a lawsuit against Adds alleging breach of contract, breach of an implied covenant of good faith and fair dealing, unlawful interference with prospective business advantage and fraud in the inducement to enter the distributor agreement.

As noted above, the trial court awarded CDT damages on its claims, including a $500,000 punitive damage award based upon Adds' interference with the sale to Intel, the terminal purchaser. The trial court noted that "fraudulent conduct and wrongful interference with CDT's advantageous economic relationship with Intel was in knowing and conscious disregard of CDT's rights and interests." The Court of Appeals reversed all of the award with the exception of $15,000 awarded to CDT in direct, incidental and consequential damages for Adds' breach

FEBRUARY, ALL EYES IN TO THE IBM PC.

Plus, we'll present personal computer experts from around the nation in an up-to-the-minute conference program. You'll learn how to choose and how to use the technology and equipment surrounding the PC family of microcomputers. Here's a partial listing of the conference sessions:

Wednesday, February 1, 1984
User Sessions:
The Benefits of the IBM PC for Small Businesses
Financing Options and Tax Advantages
Available Add-Ons and Peripherals
Software: What's Available and How to Find It
What Do the Compatibles Have To Offer?
How I Became Compatible With My IBM PC
Medical/Dental Applications for the PC
The PC in the Law Office
PC's and Real Estate
Manufacturing Resource Planning with the PC
Investment Software for the PC
CPA Software: The Bottom Line
Software for Insurance Applications
Distributed Control Software for the PC

Thursday, February 2, 1984
User Sessions:
The Anatomy of the IBM PC
Defining Levels of Compatibility Between Systems
Overview of Compatibles: Desktops and Portables
Word Processing Software
Database Management Software
Business Graphics Software
Analyzing Your Software Requirements
Overview of Major Business Applications Software
Integrated Software Solutions

Friday, February 3, 1984
User Sessions: The PC in the Corporate Environment
Review of Policy and Planning Issues
Implementation Strategies
Use of PC to Mainframe Communications (Includes Security Issues)
Local Networking for the PC

Quite simply, the PC *World Exposition* is the biggest event in Texas for the most important computer in history.
Don't miss it.

of warranty with respect to the CRT terminals.

Regardless of the outcome of the Consolidated lawsuit, it is indicative of the serious difficulties that can occur between a manufacturer of computer equipment and its distributors. The maturing computer industry is now experiencing the manufacturer-distributor difficulties long common in other industries.

There have been a number of recent lawsuits addressing the issue of adequate protection of confidential technological information. A particularly good example of protection of sophisticated technology for purposes of protecting lead time was set forth in Textron, Inc. vs. Teleoperator Systems Corp. The Textron case dealt with the issue of an independent contractor, sophisticated in industrial robotics technology, providing confidential services for a valuable consideration.

Textron was in the business of making and selling machine tools and became interested in volume production of robots for industrial uses, such as in the automotive industry. Teleoperator had a reputation as an expert in the design of manipulators and robots. As a result of Textron's requirements, Textron and Teleoperator entered into an understanding that Teleoperator would develop an industrial robot designed for the benefit of Textron.

Although there was no formal contract, correspondence between the parties made it clear that Teleoperator would be permitted to utilize the resulting robot design in a noncompetitive manner with respect to Textron. For the design phase, Textron paid more than $800,000 in fees to Teleoperator. After the development effort and in contravention of their basic understanding, Teleoperator claimed the design as its own and indicated an intention to enter into competition with Textron. As a result, Textron brought an action for injunctive relief, which was granted after a four-day hearing.

The court observed that to permit Teleoperator to wrongfully appropriate technology which would thrust it into a competitive position it should not rightfully enjoy would inflict severe damages on Textron. The court further stated that the damage would be inflicted by virtue of a ruinous competition between the parties that their agreement did not contemplate; it was expected that Teleoperator would only be given rights to noncompetitive applications of the sophisticated technology.

Companies often face difficulty when they must resort to retaining independent contractors to perform sophisticated and highly technological procedures. Having developed the technology, a consultant often wants to market the work to other organizations.

The Textron result shows the difficulties companies face when they must resort to retaining independent contractors to perform sophisticated and highly technological procedures. Once the consultant has developed the technology, it can be expected that he would want to market that technology to other organizations. However, since the purchasing company has spent a great deal of time and money in acquiring the confidential information, it would naturally want to protect the technology and lead time in the marketplace.

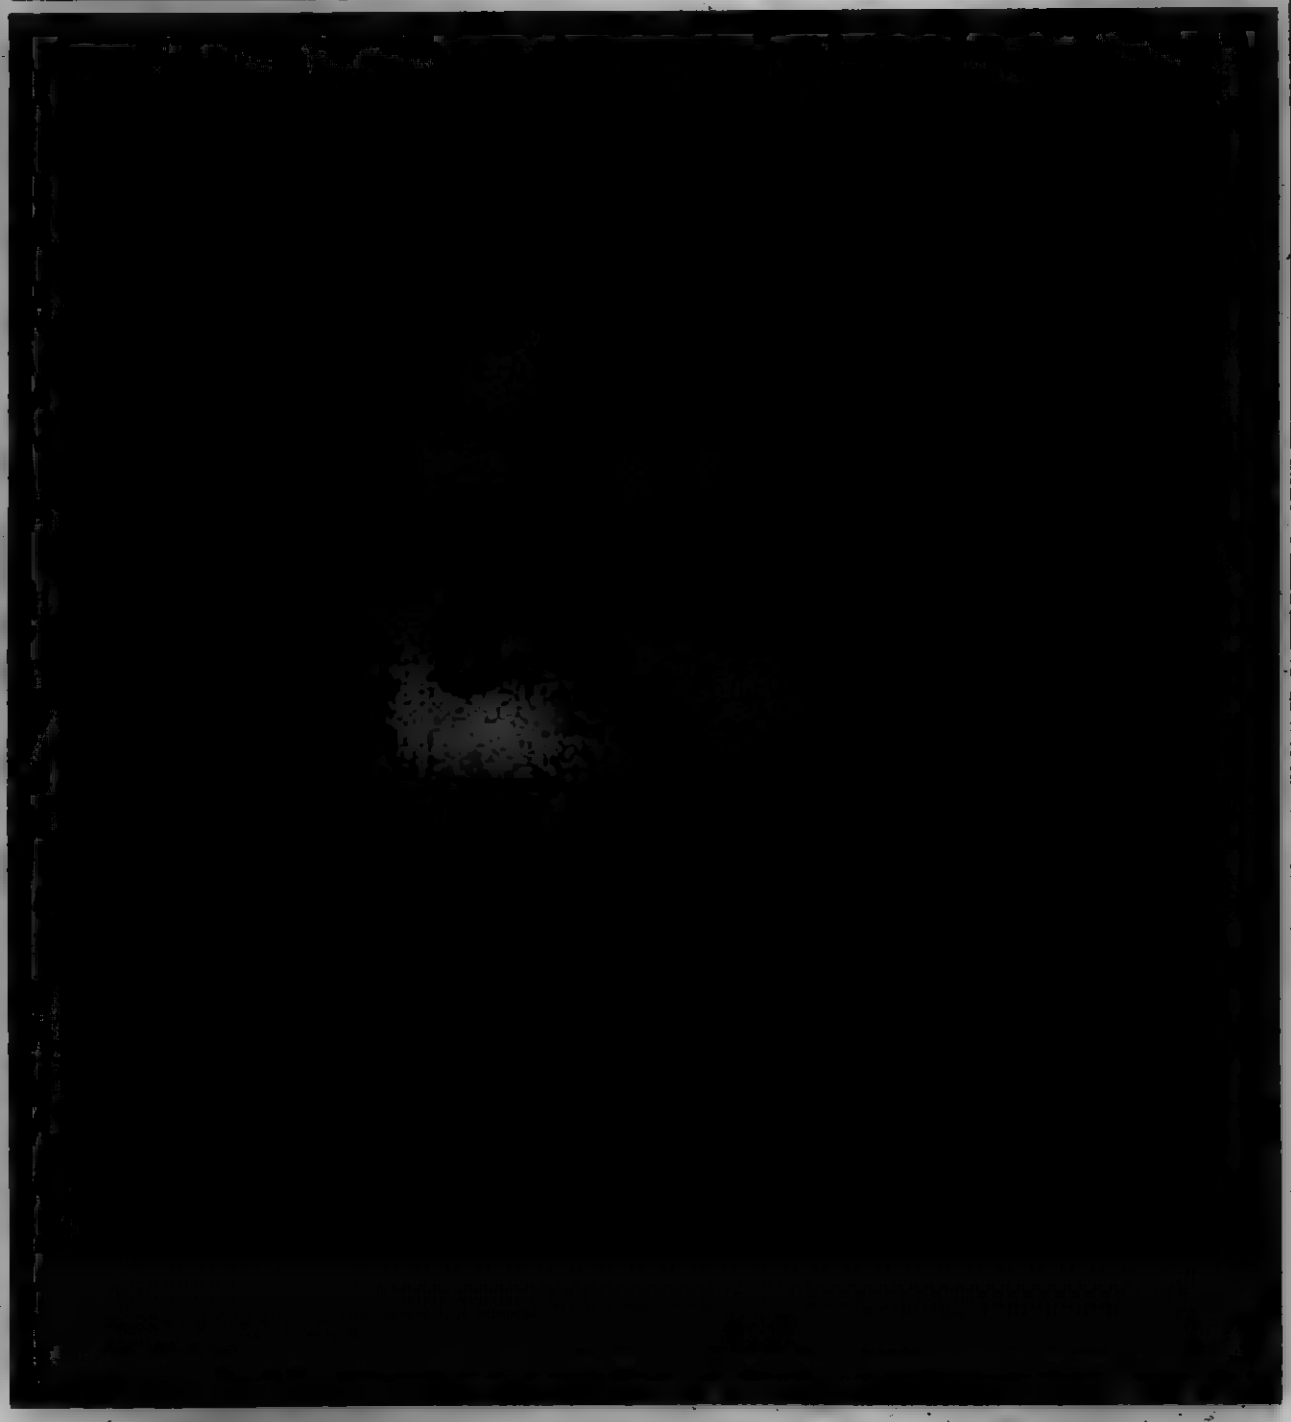
Rayman specializes in contract negotiation, litigation, protection of proprietary rights in software and other computer-related legal areas. He is coauthor of "Don't Rush To Court If Your Computer Fails," which appears in this month's Harvard Business Review.



UDS raises the speed limit for dial-up modems

At last there's a 9600 bps modem designed especially for the dial-up telephone network.

Our 9600 A/B is the ideal modem for projected system growth. Realize immediate line-charge savings by moving from 208 A/B to 9600 A/B now! Then, if your system demands dedicated lines, simple strap modifications will convert your modems. Nothing else changes!

A faster turnaround time than 208 A/B's further increases the 9600 A/B's efficiency. Multiple test modes are selectable from the front panel.

IN DEPTH

Who's in control here?

In order for micros to be integrated into the corporation, the DP charter must explicitly state who controls information management as well as the equipment and applications that support it.

By Jack Rahaim

The issue of micros in large organizations starts with the charter (real or perceived) of the DP department. In the past, there was no need to separate the role of information management — defining, processing, transmitting and storing information — from the equipment and applications that supported it. The DP department was the only show in town. Computer equipment was prohibitively expensive and complex for local organizational units or individuals.

But with the price and use barriers gone, suddenly the issue of charter becomes problematic: Who owns information management and who should own the equipment and applications that support information management?

There are a few alternatives for drawing up the DP charter:

- Define the charter to include *both* information management and the equipment.
- Define it as primarily information management and develop standards by which users can access and contribute to the organization's information.
- Be silent or unclear about the DP charter and deal with the issues on an ad hoc basis.

What follows is an attempt to clarify the issue of charter by examining the risks and opportunities that emerge from the use of micros locally.

Risky situation

Many DP professionals, although reluctant to admit it, have had virtually no experience with micros and their applications. They have developed a number of elitist attitudes about the equipment and the ability of users to do anything meaningful with it. The thought of unsophisticated users selecting, installing and applying micros is enough to cause sleepless nights for seasoned DP veterans.

Much has been written about the loss of control that DP suffers when users purchase and operate their own micros. This loss of control includes the risk that micro users will begin pressuring DP for more and better applications using centralized and local data bases, designed with the same type of human interfaces that are currently available in some of the good micro software packages. In addition, users will demand that new applications be developed more quickly and at a lower cost than DP has been able to deliver in

NESTU Presents: Two In-Depth Seminar Sessions
SET FOR FEB. 21 AT WELLESLEY COLLEGE
NORTH EAST SYSTEM THIRTY-EIGHT USERS will feature seminars:
☐ System 38 Past, Present & Future
☐ A System 38 Based Company MIS — The 5 Most Common Mistakes
Registration for the entire event is $38 for members and $55 for non-members. The price includes dinner.

the past. Micrp users generally will not understand the complexity of developing and operating a real-time, multiuser system.

At the other extreme is the risk that users will become permanently turned off to automation because of negative experiences with micros. Clearly, if the user becomes discouraged or threatened by automation, the job of DP becomes significantly more complex.

One of the most common complaints by DP managers in the past is that users lack systems understanding and/or appreciation. This lack of understanding has made it extremely difficult for both DP and the users to share ideas and language relating to business needs and the contribution automation could make.

The proliferation of micros (and good software) could, if managed properly, develop a new constituency of computer-literate users who are better able to articulate their needs and who will have a better understanding of both user and systems issues which emerge during automation. Providing DP department support and expertise to the users as they choose, purchase, install and begin using micros offers the opportunity to develop relationships which will benefit both the user and DP in the future.

The learning center can become the focal point for piloting new applications as well as supplying information and expertise on personal computer issues ranging from how to choose the right computer to how to use one productively on the job.

One excellent way to support users and develop good DP/user relationships is through the learning center. In its basic form, the learning center is a one-stop combination of hardware, software, resource people and instruction designed to introduce new users to the world of micros.

Most successful learning centers, however, gradually migrate into more than just places to learn how to use micros. The learning center can become the focal point for piloting new applications as well as supplying information and expertise on personal computer issues ranging from how to choose the right computer to how to use one productively on the job.

If the learning center is used properly, users will become knowledgeable about different equipment, the capabilities and limitations of each, as well as the applications software available. In addition, the user can be taught the importance of dealing with data consistently and the advantage of being able to share data across applications. At the same time, the DP group will gain insight into the users' needs and the kinds of support that will be required on an ongoing basis.

In this environment, DP can begin to win the cooperation and understanding of users and begin developing the ability to influence users. If DP positions itself as being supportive to micro users, users will naturally look to DP for advice and support. This situation will allow the development of a strategy to give both DP and the users the optimum combination of access and control to data.

If, on the other hand, users perceive DP as standing in their way in terms of mi-

SCIENCE/SCOPE

An optical fiber that survives baking, stretching, and radiation promises to find many important military uses. The aluminum-coated fiber, developed by Hughes Aircraft Company scientists, was subjected to severe environmental testing. It withstood temperatures up to 400°C, high strain (2%) at temperatures to 400°C, and a heavy (1 megarad) dose of cobalt radiation. Plastic-coated fibers would have melted, snapped, and lost their ability to transmit light. The metal-coated fibers will replace electrical wiring in many avionic and seaborne systems.

The new Telstar 3 communications satellite carries solid-state power amplifiers to boost its ability to carry TV, radio, voice, and high-speed data transmission services. Telstar 3, owned and operated by American Telephone and Telegraph Co., is the first Hughes satellite to use solid-state amplifiers. When combined with advanced signal transmission techniques, these devices allow the spacecraft to carry nearly four times as many telephone calls as other satellites in service. Current satellites almost exclusively use traveling-wave tube amplifiers. While these tubes use the satellite's solar-generated power more efficiently, the solid-state amplifiers are more reliable and will last longer.

Approximately 2900 U.S. and foreign patents have been granted to Hughes inventors in the last 15 years. To honor its best and brightest talent, the company each year presents the Lawrence A. Hyland Patent Award to a handful of its outstanding inventors. The award, which includes an honorarium, is named for the company's retired chairman of the board. A leading electronics inventor and radar pioneer, Mr. Hyland was granted nearly 40 patents. Among his earliest was the one for the first shielded spark plug that permitted radio equipment to be used effectively aboard aircraft. To date 104 inventors have received the Hyland award.

A new computer system promises to reduce scrap and rework, thereby helping one Hughes group slash costs by an estimated $1.5 million annually. The Quality Information System (QIS), now under development, will compile and analyze data on how defects happen and how they are corrected. Information will be made available to manufacturing employees for immediate feedback and for use during production. Data will also be kept in a central historical file for future reference. QIS is expected to improve quality by spotting problems that stem from faulty design, poor supplier quality, and improper manufacturing methods. In addition, by keeping track of how often certain hardware needs replacing, the system will help pinpoint problems with components or their applications.

An ultramodern facility spanning 1.75 million square feet is the showcase where outstanding Hughes engineering combines advanced manufacturing techniques and production processes. Our complex is complete, so we're looking for experienced and graduating engineers to work on such programs as: infrared thermal imaging systems, laser rangefinders and designators, and missile launching and guidance systems. Send your resume to Hughes Electro-Optical and Data Systems Group, Professional Employment, P.O. Box 913, E9/W101, Dept. SE, El Segundo, CA 90245. Equal opportunity employer.

cro use in order to preserve DP's historical turf, the user will resist any attempts by DP to be involved with the issue of micros.

DP departments will not have many opportunities to develop strong relationships with users. The way in which DP assumes a leadership position (as opposed to an autocratic one) will determine the success or failure of both the users and DP. It is strongly recommended that a strategy be developed to provide strong DP support and leadership for the user. Do it now or run the risk of losing the users as allies.

The equipment

The approach most users are being advised to follow is:

- Decide what you want to do with the computer.
- Choose the software that will allow you to do what you want.
- Choose the hardware that will best run the software you have chosen.

Although this approach appears valid, it assumes that the user will be using the equipment in a stand-alone or stovepiped environment as opposed to an integrated work environment. Many micros were designed to be used as stand-alone applications machines. The reality of business, however, requires that information be shared and commonly understood.

It should be the role of DP to provide the expertise to assist users in choosing equipment that will satisfy their individual needs *and* integrate local (individual) applications with department-level data and applications and ultimately with corporatewide data and applications. As individual users, they will need the ability to integrate data between applications (data base to spreadsheet to word processing and graphics, for example).

Admittedly, most users will not understand the importance of this integrative approach. If they do not, credibility and influence become critical. If DP has positioned itself properly, the user will accept the notion of integration without really understanding it.

The opportunity is clear: to develop standards by which micros are purchased and interconnected. These standards, if handled appropriately, will be perceived as enabling by the users, and the result will be a network of computers that are truly integrated.

The risks are equally clear: If users ignore the need for standards, a Tower of Babel will develop with limited (or no) ability for users to deal with each other's data and applications. At this point, DP will probably take a considerable amount of heat for letting the company "do this to itself."

Road to minis

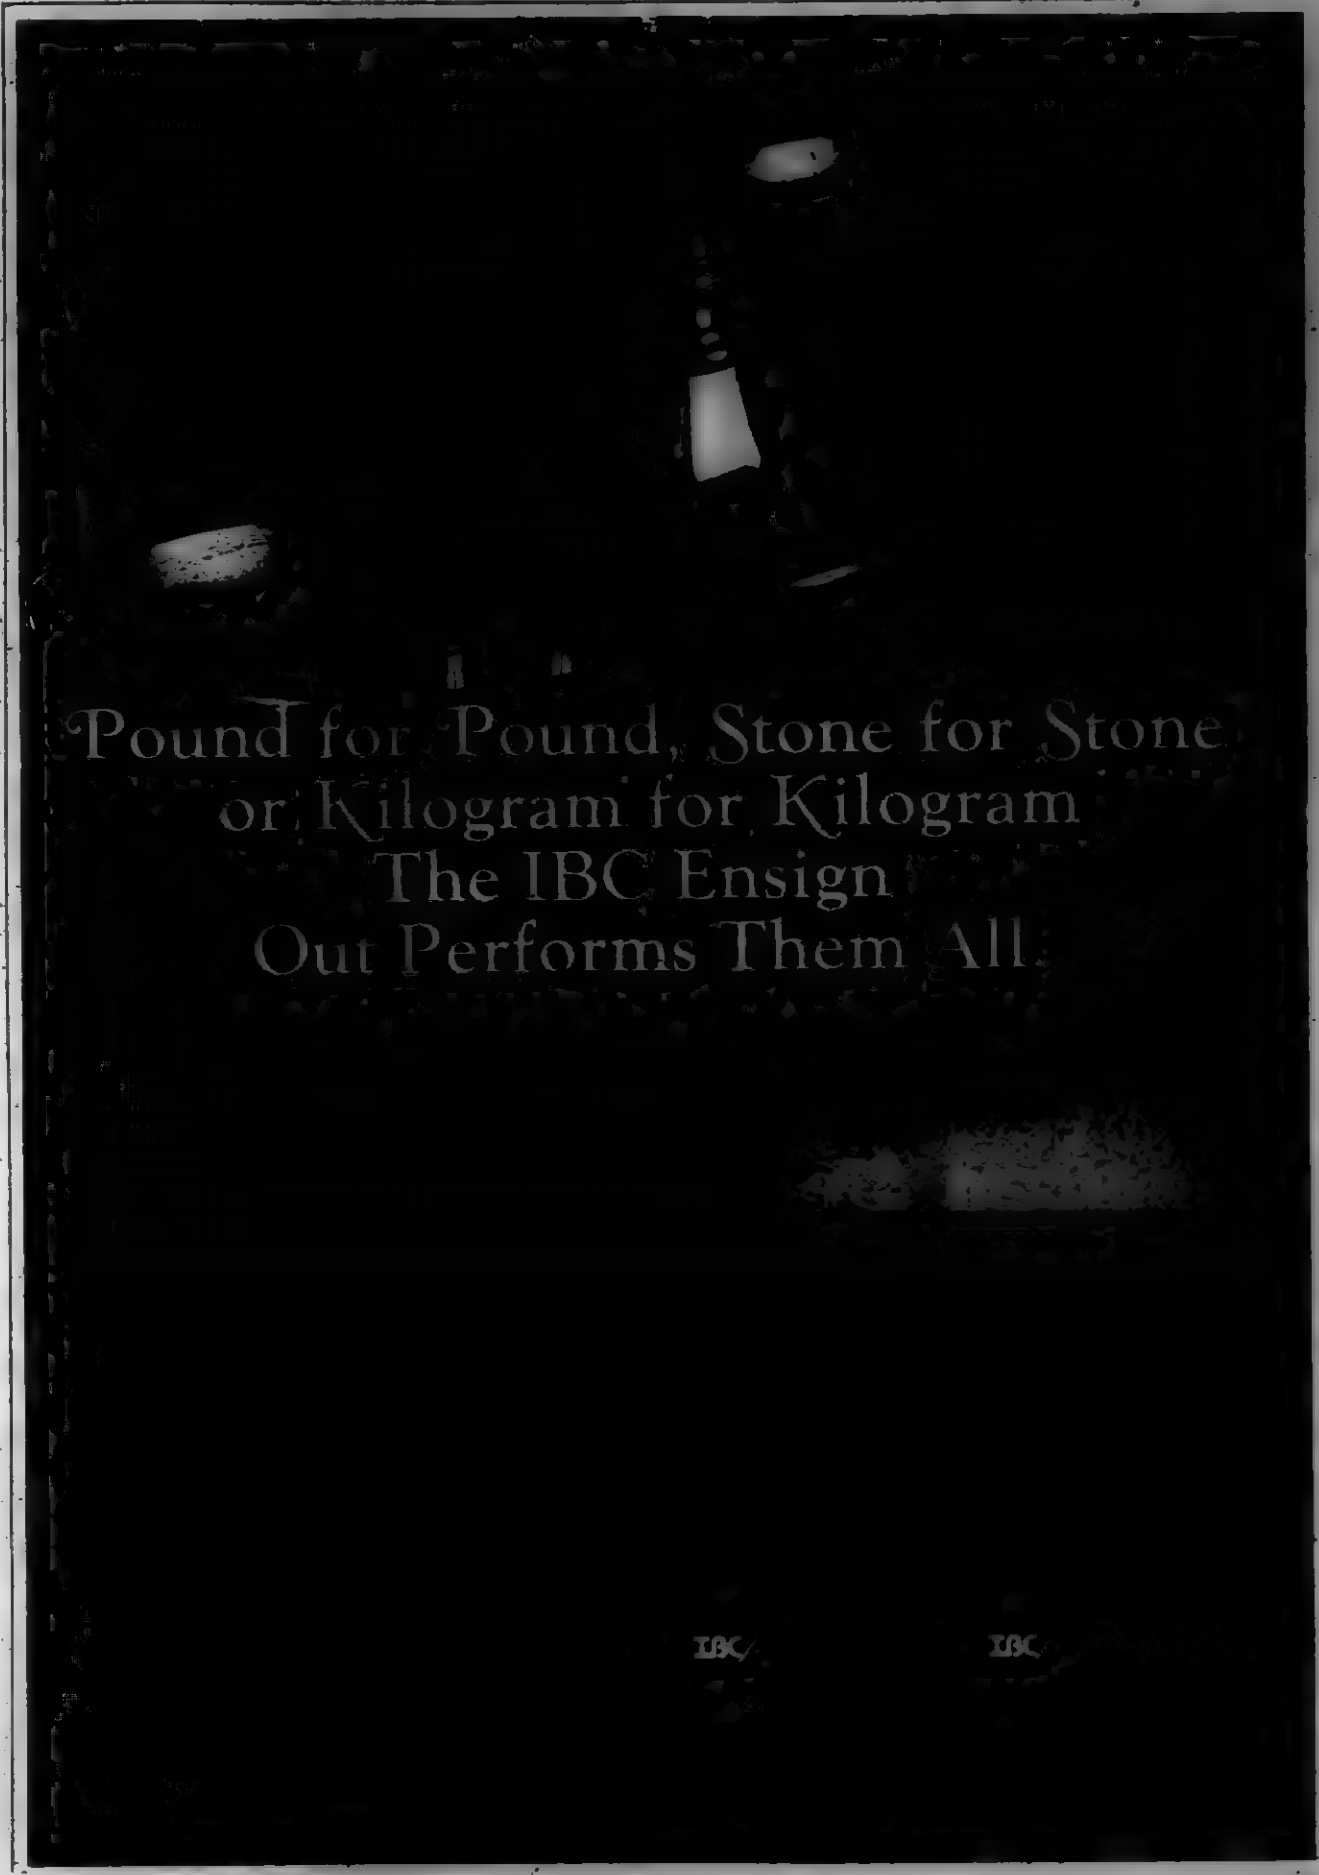
There are several reasons that the use of micros leads to minicomputers.

In a very short time, the difference between micros and minicomputers will become harder to define. They are rapidly approaching each other in terms of functions, multiuser capabilities and price.

As users begin understanding the value in integrating individual with department and department with corporate for both data and applications, the minicomputer becomes the logical choice at the department level to implement the integration.

It becomes the place where individual and department meet corporate from the point of view of data, applications and standards.

In a short time, the difference between micros and minicomputers will become harder to define. They are rapidly approaching each other in terms of functions, multiuser capabilities and price.



Apollo recognizes the fact that there are two sides to every professional.

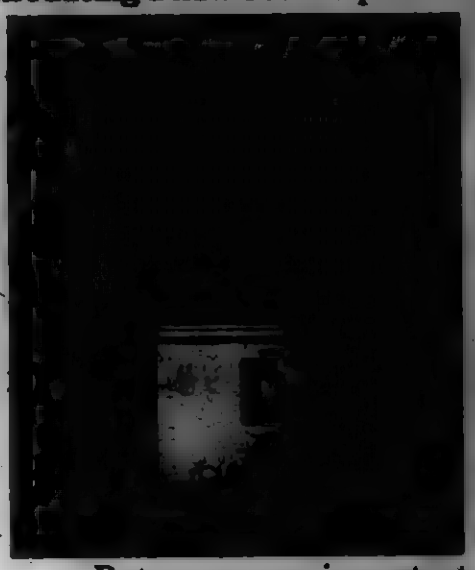
There's a part of a professional that involves their profession.

Then there's the part that goes to meetings, makes presentations, does budget, prepares documents.

According to recent reports, people who work with computers spend some 30% of their day working in their chosen profession. And 70% of their day just getting things done.

So we're announcing some ways for making better use of both sides of their day.

For starters, we've set some new standards in high performance workstations. By introducing a new set of Apollo computational nodes so fast you don't have to wait for them to figure out anything. Even when you're working on Solids Modeling, Image Analysis, Finite Element Analysis, and VLSI Design.



The power of a high-end 32-bit supermini at your desk for a fraction of the price.

The Apollo DN 660 and DN 460.

Inside you'll find up to 4 MB of main memory with full 32-bit architecture and an integrated hardware floating point unit. And enough power to handle up to 24 concurrent processes, each with up to 256 MB of virtual address space. Plus high resolution bit map graphics that among other things, can do area fills at up to 320 million bits per second.

In other words, they've got all the power of a high performance supermini like the VAX 11/780*. Except that they sit at a desk. And go for a fourth of the price.

But even more important, each DN 660 and 460 workstation node you add to the Apollo DOMAIN network adds power instead of taking it away. Because each is a 32-bit workstation with network wide virtual memory that lets all Apollo nodes share data, software, programs, and peripherals transparently across the network.

But we've also introduced software that helps professionals work with the other side of their work: DOMAIN Professional Support Services. With Document, Mail, Calc, Calendar and File. All based on the more complex needs of the professional. And fully integrated with your application programs. So you can do all your work on the same system.

All of which should come as a very welcome development to every professional. Because we at Apollo are not simply making computers. We're making workstations that work for professionals.

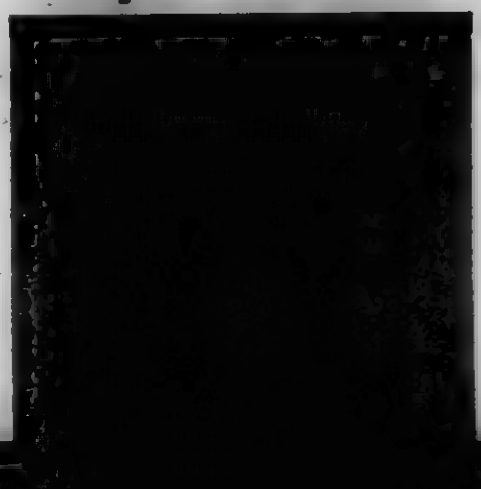
For more information call or write Marketing Services Director, Dept. J1, Apollo Computer, 15 Elizabeth Drive, Chelmsford, Massachusetts 01824 (617) 256-6600, ext. 6608.

The DN 660 and DN 460 can do state-of-the-art Finite Element Analysis at state-of-the-art speed.

They work on documents the way professionals work.

They do Electronic Mail, Filing and Calendar Management.

apollo



*VAX 11/780 is a trademark of Digital Equipment Corporation.

1983 was a very good year.

NCR introduced more major data processing products than any other high tech company.

NCR closes out its first century with one of its most impressive technological achievements, the NCR 9300. It's the first full 32-bit VLSI mainframe designed for business applications. The 9300 delivers the power of a mainframe at the price of a mini.

New computers for 1983 included the UNIX™-based Tower, a microprocessor with the power of traditional minicomputers. NCR also added new multiprocessors to our top-of-the-line 8600 mainframe series.

We introduced the NCR Personal Computer specifically designed for the business/professional market. It provides dual processor capabilities to enhance performance, and is the first personal computer designed with networking in mind. It can function as an offline computer, an online terminal to your mainframe, or networked with other NCR Personal Computers and other popular PCs.

We strengthened our position as the world's leading supplier of retail point-of-sale terminals by introducing a wide range of new products. Included is a terminal that looks up the prices of over 14,800 items stored in its own internal bubble memory.

Our number one position in automated bank teller machines produced the technology for self-service airline, ski lift and service station terminals. We are the leader in electronic banking networks and electronic funds transfer.

Why did NCR introduce all these high technology products in 1983? We wanted to get a good start on our second hundred years. For more information, call 1-800-CALL-NCR. In Ohio, 1-800-543-4470.

And 1984 will be even better.

NCR

1884-1984
Celebrating the future

UNIX is a trademark of Bell Laboratories.

People Express, one of America's fastest-growing airlines, chose an NCR 8600 series computer system to handle online reservations. NCR is a leader in online transaction processing equipment, communications and system software.

The Tower microprocessor packs a lot of computer power in a 29" x 27" x 7" package. Up to 16 operators, local or remote, can access the Tower at one time.

Debit cards and Electronic Funds Transfer became a reality in 1983. NCR is the leader in EFT technology today!

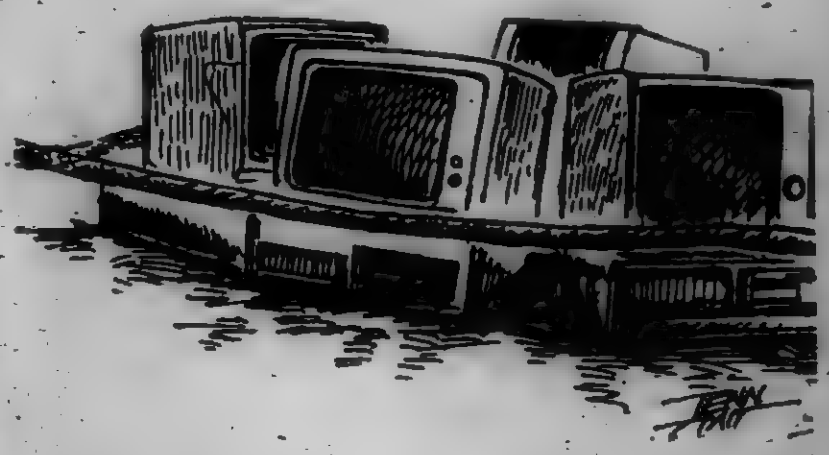
Bubble memory technology provides resident mass memory in the terminal for automatic price look-up for supermarkets and other retail stores.

The new NCR Personal Computer offers unsurpassed monochrome or color graphics. Industry standards are used throughout so the applications programs you need are available now.

New drive-through ATMs help the world bank on the go. NCR helped pioneer the regional electronic banking network and has installed more Automated Teller Machines worldwide than any other supplier.

The NCR 9300, a mouthful of computer power in a 50-pound box, was a big breakthrough in 1983. Add this 32-bit VLSI mainframe for a complete system price of less than $46,000!

Many managers are philosophically conservative when it comes to sharing data with middle managers and supervisors or across organizational lines. They will have to be convinced that sharing data offers more opportunities for productive use of information than it does risk for abuse.



It is just a matter of time until the new cliche about DP is how they are reacting to the explosion of minicomputers at the departmental level.

The use of minicomputers makes it all the more critical that DP appropriately handle users during the micro explosion. The cost and control implications will be significantly more serious for minicomputers than they are for micros.

Such issues as upward and downward compatibility, record-level security (that is, the ability to allocate by record who is allowed to access and update the data) as well as communications capability need to be understood and worked out early in the process in order to assure integration between the user and the rest of the DP environment.

The architectural considerations concerning distributed data bases, ownership of records, location and integration of applications programs and communications strategies will all become critical as more users demand and expect access to their data.

The data

Perhaps the first place where users and DP will understand the implications of systems integration will be in the area of data. Access, security, quality, integrity and synchronization of data will determine the success or failure of DP's strategy for dealing with microcomputers.

For many organizations, the issues of data base management have been few and fairly easy to manage so far. A finite number of data bases were managed and controlled by very few technocrats. Suddenly the concept of data access for multiple users opens a rat's nest of problems:

Data definitions: If users are to share data across organizations, systems and applications, a data dictionary approach will be required to manage the process. The data dictionary will need to contain data elements, who owns (and therefore updates) those elements, the commonly accepted definition(s) for those elements, the business rules and edits that apply, where they are used and in what environments (nodes, machines and so on) the elements are required. Without this commonality of understanding about data elements, there is little or no hope of ever being able to integrate data needs.

Data security: Users will quickly become unhappy with having to reenter data that exists somewhere else in the organization.

Depending on the nature of the data, the security issues may in fact impede true data integration until organizational privacy issues are resolved. Many managers are philosophically conservative when it comes to sharing data with middle managers and supervisors or across organizational lines. They will have to be convinced that sharing data offers more opportunities for productive use of information than it does risk for abuse.

Once the organizational issues are resolved, the technical issues regarding access and update will keep the DP department busy for some time.

As mentioned, record-level security is desired for minicomputers to be used in an integrated environment. Managers obviously have a need to access data from numerous data

We just made WORD-11 a native of VAX.

That's right. At Data Processing Design, we've just upgraded our popular WORD-11™ word processing package for DEC™ systems to native mode for VAX.™

Now users of DEC systems can enjoy even faster, more efficient operation. The Version 3.0 WORD-11 package provides easier, expanded system management, and supports new output devices—including laser printers.

By converting WORD-11 from Macro-11™ to full native Macro-32™ mode, we increased its efficiency and made it possible for you to optimize your system resources.

There are more enhancements, too. The new package includes scientific character set support for VT100™ terminals and the Diablo 630 ECS™ printer. Journaling. Military-style paragraph numbering to extend the existing standard outline paragraph numbering system. An advanced system management utility. And support for the Xerox 2700™ laser printer.

And, of course, Version 3.0 still has all the features that over 1500 computer installations worldwide depend on. Such as list processing, built-in dictionaries, automatic table of contents and footnoting, grammatical editing keys, and more.

For more information about WORD-11 Version 3.0, contact us at DPD. We'll be happy to provide complete details.

And point out the benefits of going native.

The user will have to be taught the significance of data and its relationship to time. Clearly, this is one of the more difficult challenges the DP department will face in managing the micro environment.

bases, and this need can hardly ever be neatly defined by the same groups of records for each application. For example, the view a user may need to have for on-line inventory or indirect labor may not (and probably does not) match the view the user should have for employee data. This variability will cause problems for the data base manager in terms of providing secure data partitions.

Data integrity: Most well-designed microcomputers provide the capability of down-line loading data to local disks. When this happens, it essentially cuts the user loose from the controlled environment that DP has created. And, if not managed properly, it can result in the user's data being terribly out of synch with the rest of the organization.

The other issue of concern is the ability for more than one user to update data.

The only safe way to deal with both of these issues is through control: controlling the data base so that it is always in synch with itself by developing strict update rules about when and how data changes. In some environments, such as payroll/personnel, a weekly view can be used, while in others, such as inventory control, strict update responsibilities will help with the data integrity.

The user will have to be taught the significance of data and its relationship to time. Clearly, this is one of the more difficult challenges that the DP department will face in managing the micro environment.

Administration: For many years, organizations have tried to ignore the relationship between automation and administration. In reality, an organization cannot successfully implement an automated solution to any problem that is not well-defined from an administrative point of view. The processes that users will invoke to do their work will have a major impact on the timeliness and usability of the resultant data.

More than likely, coordinating the administrative processes with the system will require close teamwork between the organizational entities responsible for each. In many cases, this interface will be new. Groups that are not used to working with each other or taking into account each other's needs will now have to learn how to integrate each other's needs. And, of course, automation may offer new opportunities for improving effectiveness and productivity of administrative processes.

The issue of charter appears to resolve itself best when DP plays the role of manager of information as a resource. "Data resource management" is the catchphrase of the day. DP will define what information, with what business rules, operating in what environments and interfacing with what other environments will be developed and supported. Properly communicated and explained to the users, this approach should result in a "win-win" situation for the organization.

Jack Rahaim is corporate manager of personnel administration at Digital Equipment Corp. in West Concord, Mass. Prior to joining DEC 3½ years ago, he worked in the building automation field.

Rahaim is also on the adjunct faculties of Worcester Polytechnic Institute and Mount Wachusett Community College in Gardner, Mass.

Outpaced.*

This DP department doesn't have the skills to stay ahead of new hardware/software developments. DELTAK CAN HELP.

As the pace of technology keeps changing, even seasoned staffers find their skills are falling behind. Meanwhile, applications backlogs are skyrocketing. And in most companies, there's no sign of a departmental staff-up in sight.

That's the problem. So what's the solution?

It all starts with training. You see, a properly planned DP training program can help personnel gain the practical knowledge they need to stay up-to-date. It can also ease applications backlogs by boosting productivity.

And proper training starts with DELTAK. We offer over 800 multimedia and computer-based courses for all levels of MIS professionals, from COBOL programming to database management. And since we're the world's leading DP educator, we can show you the latest ways to keep your people informed and productive.

For all the facts, call or write DELTAK today. And watch the pace pick up right away.

SYSTEMS & PERIPHERALS

SIT supermini systems debut

Use multiple microprocessor technology

By Patricia Keefe
CW Staff

SAN DIEGO — Syte Information Technology, Inc. (SIT) has announced its first product, a line of 32-bit networked engineering supermicrocomputer systems said to use multiple microprocessor technology.

Called the Syte Series 3000 Micromainframe, the product line reportedly offers the processing power of a mainframe in a desktop system.

"We intend to prove that multiple, tightly coupled microcomputers with state-of-the-art software technology are superior in performance and price to superminis like the [Digital Equipment Corp.] VAX-11/750 and the VAX-11/780 and low-end mainframes like the IBM 4300 series," Peter J. Shaw, president and chief executive officer at SIT, said.

'Virtual environment'

The Series 3000 Global Environment Manager (GEM) proprietary software reportedly allows the supermicros to run multiple operating systems on the same processor at the same time (with a multiple-window display), permitting the simultaneous use of applications software written for different operating systems, a capability that the vendor claims is an industry first. GEM creates a "virtual environment" giving each user access to the computing power of other stations, as well as to all other resources on the network, including peripherals, according to the spokesman.

The proprietary window-management software in the 3000 series allows vector graphics, bit-mapped graphics and interactive alphanumeric text within an unlimited number of windows on the display screen. In addition, software transportability is ensured among all Series 3000 models. Fortran, Pascal and C languages are available for the system, as is SIT's proprietary version of AT&T's System V, a version of Bell Laboratories, Inc.'s Unix operating system.

Each model in the 3000 series reportedly can perform floating-point calculations as fast as a VAX-11/750 for computer-aided engineering and design, and can also be used for word processing, data processing and other applications.

The Series 3000 proprietary multiple microprocessor hardware also provides performance enhancements such as paging, the vendor said.

Also, each workstation in the Series 3000 is equipped with a National Semiconductor Corp. NS 16000 series microprocessor and Xerox Corp. Ethernet networking capability. Each CPU is a single board said to include the NS 16032 16/32-bit microprocessor for executing code; an Intel Corp. 80186 microprocessor for direct-memory access, network and disk interfacing; and two Intel 8051 microprocessors — one for communications and another for diagnostic processing. Other features include cache memory, high-speed I/O and an Intel Multibus option.

A stand-alone station can be upgraded to local networking without software modifications, and multiple stations can be hooked together into a distributed network.

Engineering-oriented use

The first of the series, the Model 300, will be released later this month and was designed for use with a number of engineering-oriented applications. It consists of a CPU with 1M byte of memory, expandable to 16M bytes; a keyboard; and a 19-in. monitor in either monochrome or color. The monochrome monitor comes with high-resolution graphics (1,024 by 800 pixels); the color monitor has medium-resolution (640 by 480 by 4) bit-mapped graphics.

The end-user list price for the Model 300 is $21,900 with a monochrome CRT terminal; $24,900 for a system with a color monitor. Both systems include GEM, SIT's proprietary implementation of AT&T's Unix operating system and three programming languages. Further models are planned for the first six months of 1984, ranging in price from less than $20,000 to more than $40,000.

SIT, at 11339 Sorrento Valley Road, San Diego, Calif. 92121.

Fifth generation poses challenge

HARD TALK
TOM HENKEL

The fifth generation, a new class of processing systems which promise users high-speed and artificial intelligence capabilities, appears to be the latest challenge to world computer manufacturers. But while this new class of processors may revolutionize the way the world processes data, it also may alter the freedom computer makers have traditionally been able to exercise in offering products to end users.

Research toward the yet-to-be-developed fifth generation of processors has become the biggest political football ever to hit the high-tech business. It's the U.S. against the Japanese, with many government officials contending the U.S. has to remain on top or risk losing its respectability as a world power.

But the issues involved with fifth-generation systems go beyond the traditional one-upmanship that has traditionally been the driving force among vendors of large computer systems. The R&D money required to build a fifth-generation processor is incredible. New architectures, packaging techniques and circuit substrates must be developed. In addition, much research has to be done to understand the concepts of artificial intelligence and how they can be effectively used in a computer system.

The computer industry has been faced with challenges before, but this one is different. The financial incentives that push vendors and entrepreneurs are not as strong with fifth-generation systems as they are with commercial processing systems. Sure, there is a fertile market waiting to scoop up the first fifth-generation

Sperry terminal adds graphics to UTS 4000 line

BLUE BELL, Pa. — Sperry Corp. has expanded its UTS 4000 family of communications terminals by adding a programmable terminal with color graphics capabilities. The new unit was designed with a wide range of ergonomic features and reportedly can function as a personal computer, using Digital Research, Inc.'s CP/M 68K operating system.

Called the UTS 60, the unit comes with eight standard colors with another eight colors optional. The graphics capabilities can be used either on-line to a Sperry Series 1100 mainframe or in a stand-alone capacity using Sperry's Business Graphics Utility (BGU) package, the vendor said.

On-line graphics are provided as part of the Sperry Mapper applications development software. Hard copies can be obtained on any of three optional printers. When operating in a stand-alone capacity, the Dot Graphics Feature can be added for drawing lines, polygons, arcs, sectors, rectangles and circles in any of 16 colors. It is said to deliver 51 dot/in. both horizontally and vertically and runs in conjunction with BGU.

The UTS 60 features the 16/32-bit Motorola, Inc. 68000 microprocessor as its CPU and Zilog, Inc.'s Z80 as a secondary processor to control peripherals and the video section of the system. Other features include a low-profile keyboard; improved focus; a standard memory of 128K bytes, expandable to 2M bytes of error-correcting code memory; a CRT with a 14½-in. diagonal screen providing 80 char./line width; and data transmission at up to 9,600 bit/sec.

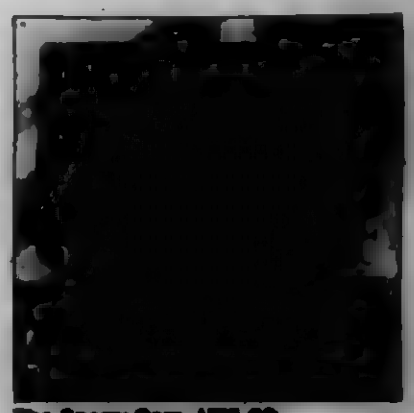
Several optional program products are available for the UTS 60 for a one-time fee. These include an edit processor ($1,080), a file-transfer utility ($1,200), diskette file utility ($600), BGU ($2,820), UTS Cobol ($3,990) and a character set utility ($1,200).

Two other utilities — the TTT Communications Utility ($50) and the Uniscope Communications Utility ($50) — are available for the CP/M 68K operating system.

Optional peripherals

Optional peripherals for the UTS 60 include the Model 31 correspondence-quality printer ($2,025, plus $30/year for maintenance); the Model 25 matrix character printer ($1,275, plus $38/year for maintenance); the Model 35 matrix printer with optional color and graphics features ($3,900, plus $40/year maintenance); and the Model 8441 mass storage subsystem ($3,940, plus $40/year maintenance).

The UTS 60 costs $5,995, which



The Sperry Corp. UTS 60

includes display keyboard, 8430 diskette subsystem and terminal control program, according to the vendor. Maintenance for the UTS 60 is $47/mo.

Sperry, P.O. Box 500, Blue Bell, Pa. 19424.

SYSTEMS & PERIPHERALS

TURNKEY SYSTEMS

ANN ARBOR TERMINALS, INC.
Guru

Ann Arbor Terminals, Inc. recently announced a full-page-display model of its Guru text editing terminals with 28K bytes of display memory, a user-definable display of up to 66 lines of 170 col. and memory of as many as 250 lines of up to 255 col.

The portrait-display Guru includes a variety of editing commands, including erase character, area, field, line and display; insert or delete character or line; push or pop line; insertion and replacement modes; and set editing extent, a company spokesman said.

A "zoom" feature reportedly allows users at a keyboard to move data on or off the screen for trade-off in character size and amount of data displayed. The terminal memory can be bidirectionally scrolled through as one large file or divided into software-defined pages, the spokesman said.

According to the company, the portrait-display option features a 15-in. CRT housed vertically to give the display the appearance of an 8½- by 11-in. page, and a Digital Equipment Corp. mode option permits the Guru to be used with standard DEC VT100 and VT52 terminal software.

The portrait-display model is priced the same as the standard Guru model at $2,395; delivery takes 30 days.

Ann Arbor Terminals, 6175 Jackson Road, Ann Arbor, Mich. 48103.

PROCESSORS

SIGNAL PROCESSING SYSTEMS, INC.
SPS-1000

Signal Processing Systems, Inc. (SPSI) has unveiled a data flow multiprocessor said to interface multiple processors and I/O devices through a smart memory. It also provides an overall control structure for high-speed, real-time applications, the vendor said.

Programmed in Fortran, the SPS-1000's smart memory acts as an address-generating processor to store and retrieve data and control streams for up to 15 attached processors. Byte-sliced and available in 8-, 16-, 24- and 32-bit configurations, the SPS-1000 reportedly can achieve computation rates to 1G operation/sec.

The SPS-1000 data flow processor, including block diagram compiler, is priced from $70,000, depending upon configuration.

SPSI, 223 Crescent St., Waltham, Mass. 02154.

AUTOCONTROL, INC.
Autolan

Autocontrol, Inc. recently announced a multiuser computer system that uses the Intel Corp. 8086 microprocessor and that reportedly allows a network of up to 255 addressable workstations.

Each workstation in the Autolan system may access disks and printers on all other workstations or may have its own disk storage system and printer, a company spokesman said.

Using a transmission rate of 848K bit/sec, the system allows disk space to be shared or assigned exclusively as needed, the spokesman said.

A basic system includes a Kaslak, Inc. AMX processor with 80K bytes of memory, 10M-byte hard disk drive, 5¼-in. double-sided floppy disk drive with 770K bytes of storage, two serial ports and Autolan software in programmable read-only memory. The basic system is priced at $4,395, with additional workstations available for $1,795 each.

Autocontrol, 11400 Dorsett Road, St. Louis, Mo. 63043.

DATA STORAGE

EMULEX CORP.
Controller price cuts

Emulex Corp. has reduced prices on a number of its disk and tape controllers for Digital Equipment Corp.'s Q-bus.

With savings ranging as high as 33%, the following models are included in the new pricing structure:

- The SC02 small/medium disk controller for use with DEC LSI-11 through LSI-11/23 Plus series of Q-bus computers. List price has been decreased 33%, or from $2,200 to $1,500/unit.
- The SC03 large disk controller for the Q-bus operating on the LSI-11/23 Plus. List price has been reduced 29%, or from $2,800 to $2,000.
- The TC02 tape coupler. List price has been reduced 33%, or from $1,800 to $1,200.
- The UC01 emulating host adapter. List price has been reduced 21%, or from $1,900 to $1,500/unit.

Emulex, P.O. Box 6725, 3545 Harbor Blvd., Costa Mesa, Calif. 92626.

TERMINALS

TELERAY, INC.
Model 72

Teleray, Inc. has announced an emulating terminal that is said to be fully software-compatible with both Digital Equipment Corp.'s VT102 and Data General Corp.'s D200 terminals. The Model 72 was developed to provide a single terminal for installations that run both DEC and DG CPUs, the vendor said.

Either of the Model 72's resident emulations can be called from its VT102/D200-compatible keyboard. Also, 32 (64, shifted) of its keys reportedly can be defined, with up to 8-char. sequences, to meet specific applications needs or user preferences.

The Model 72's two- (optionally four-) page display memory, either volatile or nonvolatile, can be reformatted by the user or processor to accommodate spreadsheets, tab listings or text, varying from a single page of

Computerworld/Mexico talks to computer people south of the border.

There are currently 15,000 installed computers on 12,000 sites in Mexico. These include mainframes, medium and small computers as well as personal computers. Experts forecast the sale of small, medium and large computers to grow at an average annual increase of 20% during the 1980s, despite Mexico's current economic problems. Minicomputers will be in great demand since they are small, affordable and efficient. U.S. manufacturers have maintained a 80% market share for the past three years with sales of over $182 million. Computerworld/Mexico can bring your message to 10,000 key-decision makers in the Mexican computer community. Published on alternate Mondays, Computerworld/Mexico covers all the latest developments in hardware, software and terminals in addition to data processing and computer related subjects. Its goal is to provide useful information to data processing professionals throughout Mexico and Central America.

"My old mainframe and my new word processor aren't on speaking terms."

Stop the shock...with Exxon office automation.

Today, many companies are shocked to discover that their electronic office machines can't talk to one another.

A shockproof system

That's why Exxon's products are designed to be part of a fully integrated, communicating office system. With a few simple keystrokes, you can initiate communications that take you just about anywhere you want to go.

Without the problems. Without the shock.

Exxon speaks your language

With communications options, our information processor can interact with most mainframe computers—and even function as a 3270 terminal. So it's easy to access your corporate data base, and retrieve the data you need.

In fact, you can even gain access to countless libraries of information, such as Dow Jones News/Retrieval® and THE SOURCE.℠ Or even send information via the Telex/ TWX® Network.

Build a shock-resistant office

Exxon's fully integrated line of information processors, controllers, and impact or ink jet printers work together to create one of the most flexible office systems available.

For more information

Call 800-327-6666, or write Exxon Office Systems, P.O. Box 10184, Stamford, CT 06904. We'll be happy to show you how our fully integrated office automation system with advanced communications can help shockproof your office.

EXXON OFFICE SYSTEMS

The future...without the shock.

FIFTH from page 82

processors, but that market is made up of government agencies, many of which are top secret. There are few, if any, commercial firms waiting for someone to develop a fifth-generation processor.

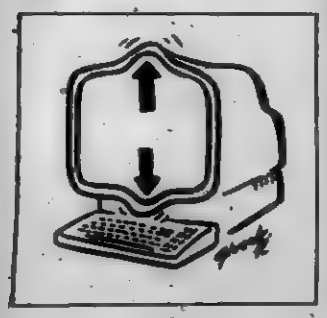
After all, what is the average DP executive going to do with very fast, artificially intelligent processors? The machines are going to be outrageously expensive, and they are not going to do accounts payable and receivable. The powers promised by fifth-generation technology may someday benefit commercial computer users, but initially they will be used to design weapons and manage missile guidance systems.

So guess who is pumping the most money into fifth-generation research projects? Government organizations like the Defense Research Projects Agency, which admits its primary interest in new technologies, particularly those employing artificial intelligence, is to build better defense systems.

Why not let the most likely users of fifth-generation processors foot the bill for their development? In theory that sounds fine. But it also marks a major change in the way U.S. companies do business. The government has always played a big role in pushing technological developments, while at the same time there has always been a separation between government and business. But in the case of fifth-generation technologies, it appears to be orchestrating many projects.

What happens if the lure of government fifth-generation funding becomes more appealing? Will the government, in effect, have control over the computer market? And what happens if the government money suddenly dries up? Not only will lots of researchers be left out in the cold, there will be many research projects which do not offer an immediate application in the commercial sector.

This may account for why many computer makers have steered away from embarking on fifth-generation projects. The investments required are very high, and while there is potential for developing very important commercial products from military projects, the payback appears to be better than 10, possibly 20, years off.



Continued from page 82

255-col. lines to 28 pages of 10-col. lines, or any other line/page combination within memory capacity. Other features include a 256-char. input buffer; two bidirectional, buffered RS-232 ports; five display attributes, seven area qualifiers, 224 displayable characters and a nonvolatile memory function, the vendor said.

Available in three CRT sizes (9, 12 and 15 in.) and three phosphors (white, amber and green), the Model 72 costs $1,535 in the 12-in. model.

Teleray, 6425 Flying Cloud Drive, Eden Prairie, Minn. 55344.

PARADISE SYSTEMS, INC.
Convertible

Paradise Systems, Inc. has introduced the Convertible, a device that converts any Ascii synchronous terminal into a personal microcomputer.

The Convertible has a built-in 256K-byte random-access memory (RAM) disk that, according to the vendor, delivers up to 10 times the speed of regular microcomputers. The user of Convertible then has access to productivity software available for microcomputers using Digital Research, Inc.'s CP/M operating system, converting data formats from one personal computer to another.

Convertible is reportedly able to read 5¼-in. diskettes formatted for a variety of personal computers.

Two RS-232C serial ports and one bidirectional Centronics Data Computer Corp. parallel port enable Convertible to connect to printers and other devices using the standard industry interfaces.

Single-sided, double-den-

"TIS GIVES BEST WESTERN INTERNATIONAL NEXT GENERATION TECHNOLOGY."

SYSTEMS & PERIPHERALS

sity disks are standard; double-sided are optional.

Users of the product can download large files from mainframe computers, edit or modify as needed at the terminal and then send the information back in its new form. Transmission rates range from 110 to 19.2K bit/sec, the vendor said.

According to the vendor, the product weighs 8 lb and is the size of a large book.

The Convertible costs approximately $1,000.

Paradise Systems, 150 N. Hill Drive, Brisbane, Calif. 94005.

SAGE COMPUTER TECHNOLOGY, INC.
Terminal; Winchester disk drive

Sage Computer Technology, Inc. has announced an ergonomic terminal available for all Sage microcomputers using a 40M-byte disk drive.

The terminal features a tilt-and-swivel screen with a 12-in., 24- by 80-col. wide, monochromatic (green or amber) high-resolution display. Medium-resolution business graphics are optional. Also included is a detachable alphanumeric keyboard with 96 Ascii character set and a compact 12¼- by 16¾-in. footprint.

The 40M-byte, 5¼-in. Winchester disk drive with 256K bytes of random-access memory has been added to the Multiuser Sage IV system. This reportedly doubles previous storage capacity and provides the option of 12M, 18M or 40M bytes of storage. It includes a 64K-byte floppy disk.

The terminal (No. PH0021) costs $590. The Winchester drive with floppy disk (No. SC0044) lists for $10,900, a spokesman said.

Sage Computer Technology, 4905 Energy Way, Reno, Nev. 89502.

PRINTERS/PLOTTERS

AMPAK BUSINESS SYSTEMS, INC.
ABS 400, 600, 1000 and 1500 band printers; ABS 150, 300, 600 matrix printers

Ampak Business Systems, Inc. (ABS) has announced a line of high-speed band and matrix line printers for IBM processors.

The ABS 400 band printer reportedly emulates an IBM 5225 matrix printer and replaces IBM 5211, 3262 or 5225 printers. It features a 400 line/min typical print rate (64-char. band); near-letter-quality printing; and 48-, 64-, 96-, 128- or 192-char. set capabilities. The unit costs $8,795, the vendor said.

The ABS 600, 1000 and 1500 band printers operate at 600, 1,000 or 1,500 line/min, respectively. They reportedly emulate the IBM 5225 and can be used in place of IBM's 5211, 3262 or 5225 printers.

Other features include operator-interchangeable bands, LED status display, self-test and long-life ribbon cartridge. The ABS 600 costs $9,750, the Model 1000 costs $14,395 and the Model 1500 costs $22,995, the vendor said.

The ABS 150, 300 and 600 (line/min) matrix printers cost $5,195, $7,395 and $9,195, respectively.

Features of this line include IBM 5225 emulation, a 9 by 9 dot matrix with descenders, double-height characters and optional graphics capability, according to the vendor.

Ampak Business Systems, 2640 Walnut, Tustin, Calif. 92680.

DAISY SYSTEMS HOLLAND BV
M20

Daisy Systems Holland BV has announced the M20, a letter-quality printer.

The M20 reportedly features a variety of interface control codes and is compatible with many other printers, including most Diablo Systems, Inc., Qume Corp. and NEC Corp. printers. Also, the units interact with virtually all computer/software combinations, the vendor claimed.

The Daisy M20 was designed for bidirectional printout, reportedly achieving 20 char./sec.

The Daisy M20 is priced at $990, according to a spokesman for the vendor.

Daisy Systems Holland BV, P.O. Box 1010, Torrance, Calif. 90505.

TIS

"TIS™ is truly a remarkable software system. With TIS operating at both the Strategic and Tactical levels of our organization, we now have a sophisticated software system capable of evolving as the needs of the company evolve. As far as I'm concerned, TIS is giving Best Western International the kind of next generation technology we need."

—Keith Barlow

Best Western International is the world's largest lodging chain. In the fast-paced lodging business, total control of accurate and timely information is no luxury. It's a vital necessity. For this reason, Best Western demands advanced software that can grow as its needs grow.

The TIS Solution

After a careful evaluation of several systems, Best Western chose TIS—Cincom's powerfully integrated data base management and application development system and winner of the Associated Information Managers' (AIM) Outstanding Information Technology Award.

TIS was brought up quickly. It was first used in a Strategic capacity to implement corporate payroll and personnel applications. Now, TIS is being used in both Strategic and Tactical operations throughout Best Western International to develop applications for financial, marketing, supply and other functions.

And, because the TIS Intelligent Query language provides easy access to corporate information, end-users are discovering that they can meet their own information needs without the aid of trained programmers.
